It is not beyond the bounds of possibility that the art of the thatcher, now almost forgotten, will again be called into being, for a well-thatched roof is a good roof. Corrugated iron roofs are being used with some of the wooden houses, but corrugated iron is an unlovely thing at the best and only emergency need has justified its use among some of the builders.

But Britain is now paying more for her wooden houses than stone or brick cost her before the war, and carpenters' wages are much higher than were those of stonemasons.

The Adventure of Mrs. Farbman

By HUGH WALPOLE

Copyright, by HUGH WALPOLE

Illustrated by HAROLD WETTERSTEN

Mr. Duhamel suggested to Mrs. Farbman that she should drink a cup of coffee in his own little room just above where we were sitting.

Synopsis of Preceding Installment

In pursuance of their enterprise of removing bores—for a consideration—the three members of the firm take on the case of Mrs. Farbman who has disturbed the domestic harmony of the Fleming family. In the capacity of secretary to Mr. Fleming, a scientist of note, she dominates the household, to the great disgust of Fleming's wife who in her desperation has engaged the services of the bore-removal agency.

ON THE very next evening Chippet and I had our first meal in the house of the Flemings. Because I am a realistic novelist, there is nothing, I suppose, in this modern world of ours that can possibly surprise me. The Flemings' house, Mr. Fleming, the numerous little Flemings, and the great Mrs. Farbman herself, were all exactly as I had expected them. There is something to me strangely depressing about Golders Green, and the Flemings' house would have been depressing anywhere. It was one of those houses in which the kitchen is in the middle of the drawing-room, and dusty palms in large glazed pots stand cheek by jowl with onions frying in the pan and water sizzling in the copper for the children's weekly bath. It was one of those houses in which every sound made by anybody within a five-mile radius is heard ten times intensified wherever you may happen to be. It is also one of those houses in which the boards creak, the windows rattle, soot falls down the chimney, the cat fights the dog, the babies fight one another, and the cook gives notice, all in your immediate proximity. I was very sorry indeed for Mr. Fleming, who was a very, very long, thin man with a forehead so high and a chin so receding that you felt that the only way to give his face any real help was to push it all down a little and then to hold it in position with iron bands for a year or two; but he had nice, mild eyes, a straggling and desolate mustache, and an anxious, deprecating air that so often goes with clever, absent-minded genius.

Mrs. Farbman, of course, was exactly what I expected her to be—one of those men in women's clothing, as flat as a board, with that contemptuous curl of the lip that belongs almost invariably to masculine women when they are in the presence of the inferior sex.

She took up a great deal of room in that small house. The masculine jacket that she wore had its pockets full of papers. She was always producing a fountain pen from the center of her masculine bosom and taking innumerable little notes in little pocketbooks, writing them down with an air of finality as though it were the day of the last judgment and she was settling the destinies of all the poor human beings who were waiting in frightened, huddled masses at her large, uncomely feet. It was quite natural that Chippet and I disliked her at sight. It was equally natural that she disliked and despised us. Mrs. Fleming introduced us as two young men who had been immensely attracted by what they knew of her husband's genius and had come thirsting for more information. Mr. Fleming was as touched as a child by my eager inquiries about newts and their habits, and one or two remarks that Chippet made about snails and their different geographical varieties brought tears of pleasure into his eyes; but I realized that Mrs. Farbman detected us at once for the humbugs that we were. I realized also, during that first meal which consisted very strangely of scrambled eggs, cheese cakes and meringues, both that Mrs. Fleming was not a good housekeeper, and that this business of ours, into which we had entered with so light a heart, was going to be no easy one. Halfway through dinner, supper, or breakfast, whichever you like to call it, there was a sharp little contest between Chippet and Mrs. Farbman. Mrs. Farbman had a terrible habit of leaning her bare and bony elbows on the table, supporting a face which exactly resembled that of an intelligent and over-educated horse upon them, and staring at the speaker of the moment with a penetrating glance of contemptuous scorn. She was so staring at Chippet, who was trying to explain to Mr. Fleming that when he was a small boy he had kept snails in a cigar-box and harnessed them to match-boxes, and made them run races with one another, which, he went on, he would never have done had he only known, as he knew now, what interesting creatures they were.

'Humbug!' said Mrs. Farbman suddenly.

'I beg your pardon?' said Chippet nervously.

'What you're saying about snails,' said Mrs. Farbman, 'is humbug. You never cared in the least about snails, and you don't care about them now.'

'Excuse me,' said Chippet, flushing angrily. 'Allow me to have my own opinion about the things I care for and the things I don't.'

'Oh, you can have your own opinion,' said Mrs. Farbman, 'but I wasn't born yesterday, you know,' which, indeed, was the truest thing she ever said.

I saw at once that these were the worst possible tactics for us to adopt. I tried to kick Chippet under the table, but most unfortunately kicked Mrs. Farbman instead. She turned her attention to me, and I did my best to be as charming as I knew how, but really the woman was intolerable. She

assumed complete command of the house, and when one of the children was heard crying in the next room, and Mrs. Fleming rose to go to her, Mrs. Farbman said: 'Sit down, Flora, sit down; don't make a fool of yourself.' When a very untidy maidservant brought in the meringues, Mrs. Farbman, glaring at her, said: 'What was that noise that I heard in the kitchen just now?'

'Nothing,' said the maid, tossing her head.

'It was the loudest nothing I've ever heard,' said Mrs. Farbman. 'That china shall be deducted from your wages.'

She ruled, in fact, the house with a rod of iron.

Now, this is the really interesting feature of this our first adventure. You will certainly say that Mrs. Farbman, as I have described her to you, is a good deal of a caricature, and to that I would reply that more people are caricatures than you probably know, and that many people are caricatures at first sight and cease to be so when we know them a little better. Now, this, I repeat, is the curious and interesting thing—that before the end of our meal I was beginning to be quite fond of Mrs. Farbman. I cannot explain this except by saying that, as I am a modern novelist, the most extravagant types have an interest for me, but, apart from this professional tenderness, there was something about Mrs. Farbman that was lonely, touching, and pathetic. With that swift perception of human nature that is one of the finest gifts I possess, I saw that she was a lonely, unloved woman, whose rudeness and masculinity were largely a covering for a longing for affection and some sort of commendation of her talents and erudition.

MR. FLEMING was, in all probability, the only human being in all her life who had appreciated her brain and industry, and it was for that appreciation that she clung to him more than for anything else.

After dinner we sat in the small, stuffy sitting-room that smelled of mixed biscuits and stale eau de Cologne, and Mrs. Farbman held forth at interminable length on the connection between the psychoanalysis and the suffraget movement. She had a great deal to say, and she said it vigorously, and I saw at once that she was longing for our appreciation, as eager for it, indeed, as a small girl who is reciting for the first time her school piece before a crowd of indifferent relations. That was a picture that I shall never forget—the close, ill-smelling room, overcrowded with marine pictures, china ornaments, bamboo bookcases, albums of family photographs, ferns and human beings, with Mr. Fleming's long body stretching right across the floor, his eyes closed and sunk deep into his forehead, his bony hands clasped together on his lap, Mrs. Fleming angry, watching Mrs. Farbman with indignant eyes, Chippet, distressed already by the certainty that we were going to fail in this our very first case, and Mrs. Farbman, seated like a man, leaning forward, her elbows on her knees, staring into space, her voice rolling on and on, and words like 'Freud,' 'Jung,' 'Inhibition,' 'Mrs. Pankhurst,' and 'Bolshevism' spattering the floor with such vigor and energy that it seemed as though they must leave permanent marks on the faded carpet.

YES, I liked her better and better as the evening proceeded. I remember once, at the zoo, seeing a large monkey in the corner of its cage, chattering, making fantastic gestures, scratching itself in impossible places, doing everything it could to attract the attention of a group of bored and superior monkeys who were half asleep in another corner, and in the eyes of that large monkey there was a look of the most desperate loneliness I have ever witnessed in animal or man. Such loneliness was there in the eyes of Mrs. Farbman. More touching still was it that she herself was unaware of this, and would have been certainly most indignant had you told her of it. As she talked I saw in her all those long desolate years, that eagerness for wisdom, and longing for the possession of some human being who would care

'Give us another week, Mrs. Fleming, and if we are still unsuccessful, we will call the case off.'

for her and her alone, that consciousness that must have come to her in spite of herself of her ugliness and oddness, that desperate sense that even this man Fleming, whom she had succeeded in attaching for a brief period, might at any moment slip from her. All these things I saw, and you may believe me or no, as you please, but before that first evening was over I felt, as I considered the project that had brought Chippet and myself to that house, something very little short of a murderer.

A MURDERER! Yes, that's all very well, but we had our business to consider, and at the end of the first fortnight we were bound to confess that we were dangerously near to defeat. Other things were happening at this time, other clients were coming to us—of whom I may speak on another occasion—and Borden was conducting one of these with every prospect of success, but this affair of the Flemings was for Chippet and me, our ewe lamb, our first-born, our precious pet. Chippet was nearly in tears whenever he thought of it. Mrs. Fleming was becoming frankly impatient, and I could see that if we failed there would be great trouble in extracting from her the promised fifty pounds. She had begun by thinking us perfectly delightful; there was every prospect of her ending by thinking us contemptible fools. We spent a great deal of our time under the Fleming roof. Those rooms had already overflowed before our arrival, and it was not, in very truth, vastly diverting to spend hours of the day and the best part of many an evening in a small, stuffy villa in Golders Green, stepping, so to speak, from infant to infant, and eating meals of so horrible and unnatural a kind that Chippet's hitherto admirable digestion was in danger of being permanently ruined, and I myself turned quite green at the thought of scrambled eggs, a dish in which I had hitherto delighted. But the main trouble was this increasing affection of mine for Mrs. Farbman. It baffled Chippet completely. At first he supposed that I was being diplomatic and seeking to gain an influence over her. Then when he discovered that I was winning no influence at all, and that I really seemed to like to be in her society, and when he caught me on one occasion looking into her dim and gray-green eyes as I might have looked at the face of my favorite dog, he was puzzled and finally indignant.

'Good Heavens, Seymour,' he said, 'you don't mean to tell me that you like the woman!'

'I do like her.'

'But she hates you. She hates you even worse than she hates me. She's a terrible woman!' And his voice rose into a shrill scream, as it often did when he was excited.

'I don't know that she hates me,' I answered, curiously hurt at his accusation. 'I think she's rather beginning to like me.'

'Oh, no, she isn't,' said Chippet. 'I overheard her saying last night to Mrs. Fleming that she would be very glad to know how much longer those

'What you're saying about snails,' said Mrs. Farbman, 'is humbug. You never cared in the least about snails, and you don't care about them now.'

two imbecile friends of hers were coming to the house; and Mrs. Fleming said that she thought that she would like to have a clever novelist to talk to, and I won't tell you,' continued Chippet, smiling maliciously, 'what exactly it was that Mrs. Farbman then said about you as a novelist.'

'Oh, don't mind me!' I said hurriedly, pretending not to care.

'Oh, no, I don't,' said Chippet, 'only I will tell you this—that time's passing, and if you're going to waste these precious hours by attempting to win Mrs. Farbman's bony heart, you are not playing the game, and we may as well dissolve partnership.'

I COULD not deny that Chippet was right. Business was business, and however attractive I found Mrs. Farbman, something must be done to further our plans. And yet how strange and even, in an obscure way, romantic those hours in her company were! I have never known so truly stupid a woman as Mrs. Farbman was, nor have I ever known any woman capable of such a flood of apparently clever conversation that was finally quite meaningless. It was with this meaningless flood that she surrounded and overwhelmed poor Mr. Fleming. He may have been once, in the days before the arrival of Mrs. Farbman, aware of the ultimate purpose and purport of his book, but she had by now so fluently confused him, she so persistently led him off the straight track the moment that she perceived him to be upon it, she flung at his enormous, but I cannot help thinking, rather empty forehead such incessant little pellets of disconnected information, that the poor man just crumpled up and moved in a kind of stupor from phrase to phrase, seeing his newts, his tadpoles, his snails, and whatever, all scuttling away from him—I am quite aware that newts and tadpoles cannot scuttle—into a vast misty distance whence he desperately began to be aware he would never recover them.

IT WAS for this reason, I think, more than any other, that he would really have given his immortal soul to be rid of Mrs. Farbman; but you had only to look at him, to listen to his mild, amiable voice, to watch the timid way in which he scratched his fast thinning hair, to be aware that he would never of himself be able to escape this bondage.

At the end of the third week the crisis arrived. We came, Chippet and I, one day to tea and found Mrs. Fleming alone. We could see plainly enough that she was in the very worst of tempers. 'Well,' she asked us, her blue eyes flashing, her little snub nose trembling with indignation, 'do you mind telling me how long this farce is to continue? I hope you will forgive me if I say exactly what I think.'

'That,' interrupted Chippet, smiling nervously, 'is what we want to hear. I know that so far we have not been a great success, but——'

'Thank you,' broke in Mrs. Fleming, 'I am grateful to you for admitting that much. No, you have not been a great success, and I hope your feelings won't be hurt if I tell you that I am not at all sure that you are not a pair of humbugs against whom one might very reasonably bring an action. Here have we been three weeks, and Mrs. Farbman is more securely in the house than ever before. You have done nothing,' she cried, 'to persuade her to leave us! You have had innumerable meals in my house, and although I am not one to begrudge my friends any hospitality we can afford, yet my husband and I a not wealthy or would not be li ing in Golde Green. You ha done nothin nothing, nothin She then burst i to tears.

'Give us a other week, M Fleming,' said 'and if at the e of that time we a still unsuccessf we will call t case off, and will not ask you pay us a penny.'

This mollifi her somewhat.

'You must co sider, Mrs. Fle ing,' continue Chippet eagerl 'that we have su gested a number plans that you have refused to conside such as Seymour here traveling wi Mrs. Farbman in an airplane to Par and leaving her there, or hiring a mot car and going with Mrs. Farbman the Lake District and losing her on o of the mountains, and there have be many other schemes of that kind whi you have absolutely forbidden us consider.'

'There,' she cried, in the middle her tears, 'doesn't that show how i competent you are? Haven't you see already enough of Mrs. Farbman know that no mountains and no Par nor anywhere else would prevent h from returning? She will follow wherever we go. I see myself withi another six months a murderess in t dock at the Old Bailey, my husban dying of a broken heart, my childre thrown upon the streets!'

A very trying scene, in sooth. Mr Fleming's tears were as bad as Mr Farbman's psychoanalysis, and, quit frankly, of the two women I infinitel preferred Mrs. Farbman.

THAT night Chippet and I were i despair. We suspected that we had, aft all, no real talent for this particul business, and it intensely chagrined u both that our partner Borden—whom w had always rather despised as an ove muscled and brainless sportsman—should be bringing his first case, tha remarkable one of the Twickenha footballer, to a really successful issu while we were failing.

Upon what little chance do th wheels of life turn! Had it not bee for a curried egg I might at this momen be begging my bread in the streets o London, Chippet might never hav become Sir Gordon Chippet, I. B. E.— our lives, in fact, might have ended i dismal and untimely failure.

On the following evening we were once more dining at the Flemings'. It was a melancholy meal; even Mrs. Farbman was rather silent, my heart was like lead. Sardines had been our first course—those especially greasy and enormous sardines that are like miniature whales, with huge spine-bones warranted to defeat the strongest teeth. Our second course was a dish of curried eggs, better cooked, I must honestly confess, than anything that we had yet eaten under the Fleming roof. I was sitting opposite Mrs. Farbman. The dish went its round, went round a second time. It was enough for me to have caught one glance, one gesture, one spark of a gray-green eye. That night, as we found our places in the Hampstead tube, I clutched Chippet by the arm and murmured excitedly in his ear: 'I believe we are saved; I believe I have found a way out at last.'

'What do you mean?' he replied so loudly that a row of *Evening Standards* descended and a succession of astonished faces stared in our direction.

'Wait,' I answered. 'I must think this out tonight, but I believe the key is discovered.'

On the following afternoon I went to the Flemings' house and found Mrs. Farbman there alone. I came in without her hearing me, and caught her seated low down in a crazy rocking-chair, staring in front of her, the inevitable notebook on her lap, and in her eyes that same monkey-like absorption of loneliness that I had noticed before. I stood there for a moment watching her. I knew so well what she wanted, and yet I was taking away from her the closest semblance to that need that she had ever found. In all this, as you will have by now perceived, the Flemings themselves were very shadowy creatures to me. I have a scorn of human beings who are unable themselves to remove burdens for which they themselves are responsible, and that scorn was going to make my work difficult for me in many ways. What would happen, I could not but ask myself, if it was in these cases to be always the bore who roused my sympathy instead of the sufferers from the bore? Well, if that were so, I should learn something more about my fellow-beings than I had known before, and that same learning is, I imagine, the chief aid to knowing something more about oneself, which, in its own turn, is the first purpose of life.

Well, to get on with my story. The first words that sprang from my lips—and they literally did spring, to my own intense surprise—were: 'Oh, Mrs. Farbman, I wish you liked me better—I do like you so much!'

This remark, when she had supposed that there was no one in the room besides herself, naturally made her jump. She turned round to me, notebook slipping on to the floor; then, when she saw who it was, she gave a kind of grunt of dissatisfaction and turned her back on me again. Then she said, speaking as it were to no one in particular: 'I don't like many people in this world and young men (*Concluded on page 26*)

The Cheapest Thing *in* Europe— HUMAN BEINGS

DIAMONDS are relatively cheap in Europe! Wines and liquors are cheap, rated in dollars and cents, in Europe. Furs and fine robes are to be had for a comparative song in Europe. But cheapest of all the things in Europe are human beings.

In England as in Germany, in Holland as in France, in Denmark as in Italy, in country of high exchange, in country of low exchange, in country with currency at par as compared with 1914, everywhere in Europe human beings are to be had—cheap.

The railroad employe, the street cleaner, the municipal workers, the day laborer in every walk, the clerk in the bank, the commercial traveler, the employed are all cheap. Hardly one receives a wage which suffices to pay more than bed and board and a trifle for clothes. Scarcely one is sufficiently valuable to require the services of a life-insurance agent. Insurance here is largely to pay the funeral expenses, to provide a decent burial. But widespread insurance of human beings is not found in Europe. Human beings are too cheap.

There may be a vicious circle which prevents the decent living wage in Europe. How can wages be higher without further increasing the cost of living? But vicious circle or not, prosperity will never come to Europe until the laborer is deemed worthy of his hire. Here the ox is muzzled who treads out the corn.

Meat and butter and eggs cost about the same as in America. Bread and vegetables are slightly cheaper. Rents for the common people are appreciably cheaper, being regulated by law. Clothes are also less, railroad and street-car fares, theaters and amusements are not as expensive in Europe as in America. But wages are not one-third the American wage; a dollar a day is hardly attained by the day laborer in England, in Denmark, in Holland, in France or Italy or Belgium. The result is that the laborer, representing the great mass of the people, has not enough wage to get the decencies of life.

In ordinary apartments a bath is entirely exceptional, toilets are atrocious, running water is not common.

A successful commercial traveler in France or Belgium gets about 1,000 francs a month; a highly successful one may achieve 1,500 francs, or approximately fifty-eight dollars. But after paying for apartment and for food and clothing there is left a sum inadequate to buy a piano, a phonograph, a wireless, or even to dream of an auto.

A stenographer in France or Belgium gets possibly 600 francs a month, not sufficient to provide more than the absolute necessities. The mechanic in England receives two pounds a week, and if especially capable may receive two pounds ten (shillings), about twelve dollars and a half. But this provides no margin for luxuries and not sufficient for the decencies. The clerk on small pay must dress for his job; in England this requires frock coat and silk hat for everyday wear for a man who gets possibly twelve dollars a week.

In Belgium and in Holland and in France day in and day out thousands of women spend several hours a day in laboriously washing the pavements, scrubbing and polishing the house entrances. On hands and knees you see a Belgian woman scrubbing the sidewalk, rinsing out the cloth over and over again by hand. Yes, again and again you see a woman take a large brush and with water and brush scrub the paved street where horses have passed. It is a picturesque sight, often depicted by artists! It is not a picturesque sight as you reflect upon the meaning. These poor humans have nothing better to do.

The problem of the sexes is much more apparent in Europe than in America. Themes which are hardly broached with us are exploited in the theater and on the printed page. America has its quota of such literature and drama, but in Europe there seems absolutely no limit to what is presented. This rests fundamentally upon the disregard for humans! The fatherless babe and the wrecked family are, after all, only cheap humans!

The dignity of man, the superlative value of human beings, must be recognized in Europe before the world will be right again.

Where SANTA *and* What H

Snapshots *From* Kris Kringle

Above—He makes sure the chimney is all clear for his exit on Christmas Eve.

Right—Santa's workshop. The shelves are full of toys and things for all Christmas stockings. If you look very closely you may see your present there. Santa is all dressed up, ready for his annual Christmas journey.

Left—Out in the woods Santa Claus has a Christmas tree of his own. It is not a cut-down tree which soon withers, but a real growing tree which lasts for many Christmases. Santa has trimmed this tree since it was quite little, and see now how much taller it is than he! Perhaps he is wondering how he can trim it if it grows much higher.

AUS Lives Does

Right—Santa tests out a toy telephone. He is probably saying, 'And what would you like in your stocking for Christmas?'

Above—Ready to hitch up the reindeer. The sleigh is loaded with toys and covered with snow. It is a frosty moonlight Christmas Eve.

Left—Santa puts wood on the fire to keep it blazing till he returns home early Christmas morning. He must keep his forest hut snug and warm.

—And here is his hut e deep, thick woods. It find, but you will know sign on the chimney: A'S WORKSHOP.'

Right—Home at last from round the world, and tired out. Santa was up all night and is sleepy. His tiny bedroom is just behind the fireplace.

The Boston Tea Party's *Last Survivor*

David Kennison, *One of the* Famous Raiders, *Who Died at the* Age of 115

By FRED L. HOLMES

TABLET ON ATLANTIC AVENUE, CORNER OF PEARL STREET, BOSTON, COMMEMORATING THE TEA PARTY.

THE BOSTON TEA PARTY

Here formerly stood Griffin's Wharf at which Lay Moored on Dec. 16, 1773, Three British Ships with Cargoes of Tea. To defeat King George's Trivial but Tyrannical Tax of Three Cents a Pound, about Ninety Citizens of Boston, Partly Disguised as Indians, Boarded the Ships, Threw the Cargoes, Three Hundred and Forty Two Chests in all, into the Sea And made the World Ring with the Patriotic Exploit of the Boston Tea Party.

'No, Ne'er was Mingled Such a Draught
In Palace, Hall, or Arbor,
As Freemen Brewed and Tyrants Quaffed
That Night in Boston Harbor.'

—Brown Brothers Photo.

Wash drawing depicting the wild activity which centered about the British ships moored in Boston harbor on the night of December 16, 1773.

ONE of the most interesting public monuments in Chicago has been erected to a man who would have been buried in the potter's field had not its city council intervened.

Three-quarters of a century ago, David Kennison, the last survivor of the Boston Tea Party, worked as a day laborer in Chicago. As he approached the 115th birthday anniversary, his health became so impaired that he was forced to seek charity. A few months later, when he died, he would have gone to a neglected grave had not the patriotic impulses of the city demanded something better. Instead, he was buried with ceremony, and since then fate has decreed that his grave, now marked by a large boulder, shall remain at the gateway of one of the principal public parks.

Lincoln Park has within its confines the famous bronze figure of Lincoln, by St. Gaudens; the memorial to Eugene Field, 'the children's poet'; the serene philosophical face of Benjamin Franklin; and the equestrian monument of General U. S. Grant, the largest casting ever attempted in this country. It was to see these and the many other wonders that I visited the park one bright morning in autumn.

'What things of interest do most people come here to see?' I asked one of the attendants.

'Everyone who comes asks to see the Lincoln monument,' he replied, pointing in the direction of the southern end.

'And what else?'

'Those who know about it want to see that big black stone to "Dave" Kennison. He was in the Boston Tea Party, and was 115 years old when he died.'

'Where is that?' I persisted.

'Over under those big shade trees near the west entrance to the park. He was buried there in 1852.'

Chicago was just emerging from its Fort Dearborn military life and village habits when David Kennison came west to make the place his home. It was a city with a population of 40,000 when he died; the first steam railroad had come three years before, and while he was still a resident an ordinance was passed prohibiting hogs from running at large in the city streets.

Blazoned on the bronze marker beside his grave is the statement that he was 'a member of the Boston Tea Party.' That single achievement takes the visitor back in the history of this country to a time when the colonies existed under British rule; when England was attempting to lay a tax on imported tea and when Samuel Adams and John Hancock were thundering that 'taxation without representation is tyranny.'

David Kennison was born in New Hampshire in 1736 and was living in Boston when the quarrel over tea and taxes was at its height.

The first tea ship from England after the tax had been decreed docked in Boston harbor on Sunday, November 28. The Puritan sabbatarian scruples were momentarily forgotten in the emergency and Samuel Adams invited the representatives of the adjoining towns to meet the following morning at Faneuil Hall.

Then followed many days of conferences between the consignees, the ship captain and the protesting citizens. Finally the colonial governor, a Royal appointee, took a hand and issued a proclamation forbidding 'further unlawful proceedings at their utmost peril.' The town meeting countered with a resolution forbidding all owners or masters of ships to bring tea from Great Britain or to any part of Massachusetts so long as the act imposing a duty on it remained unrepealed.

Two or three days after this meeting two other ships of tea arrived. Every precaution to obstruct the landing of their cargo was made. A military watch was kept at the wharf day and night, sentinels were placed in the church belfries and post-riders, with horses bridled and saddled, were kept in readiness to spread any notice of alarm to the adjoining towns. Such a state of excitement could not exist longer.

Under the law, a ship which has docked must obtain a clearance within twenty days. On Friday, December 17, the time limit would be reached for the first ship. On the morning of the sixteenth, affairs reached a crisis. Another meeting was called in the Old South Meeting House. In the streets were several thousand sympathizers. This proved to be one of the momentous days in the history of the world.

Hopeful of averting trouble, the ship captain was induced to visit the governor and ask for a clearance that the cargo might be returned to England. This the executive refused. While this conference was being held between the captain and the colonial head, however, a plan was being worked out by Samuel Adams and his advisers to meet the situation. A secret meeting was held in the office of the Boston *Gazette*. What was determined there did not become public until later. Shortly before the governor's refusal came, however, a resolution was passed by the meeting that the tea should not be landed. That showed the sentiment of the people.

It was nightfall when the communication of refusal was received. It met with no outward demonstration. The little church was dimly lighted by candles and the place had taken on a quiet and serenity, as if some great happening was about to occur.

'This meeting can do nothing more to save the country,' declared Samuel Adams, after the reading of the executive edict.

These fateful words were the signal for ction. They were a declaration of war. ut of the somber stillness came a war whoop nd fifty men in the guise of Indians hur- ed out of the midst and to the wharf. mong them was David Kennison, destined be the last survivor of the band

Before nine o'clock that vening the three hun- ed and forty-two chests tea upon the three ships ad been ripped open and mped into the ocean. ot a person was harmed. here was no rioting. A eat crowd looked on ap- ovingly during the early osty evening as the boxes ere hacked open with atchets and dumped over- oard. Then all departed nd the scene became iet.

Next morning the inds and the waves had afted the salted tea in ws of green foam all ong the Dorchester each and Paul Revere was riding into the awn toward New York to spread the news hat Boston had thrown down the gauntlet the King of England.

The Boston Tea Party was an assertion the principle that there could be no axation without representation. The un- ounded sentiment and rejoicing in the her colonies which followed showed that he people were united. It was this cohesion sentiment which resulted in the determi- ation to revolt and the ultimate winning independence.

'Often as it has been cited and described, he Boston Tea Party was an event so great that even American historians have failed to do it justice,' declared John Fiske, the distinguished American historian, in writing of this episode.

When war came David Kennison was a fighter at Lexington, Bunker Hill, and many another battle of the Revolution. The muster rolls disclose that he was also a soldier in the War of 1812.

Kennison must have been a man of remarkable physique. After the Revolution he settled for a time in New York, where he met with many physical injuries. A falling tree fractured his collar bone and two ribs; the accidental discharge of a cannon at a military review broke both of his legs, and the kick of a horse left a scar on his forehead which he carried to his grave. He was married four times and was the father of twenty-two children.

Becoming separated from his family, Mr. Kennison journeyed to Chicago in 1845, where he spent the remainder of his life. He received a pension of eight dollars a month from the Government, but was compelled to work at day labor to earn enough to support himself. Finally he became an object of charity. His death occurred February 24, 1852. Even in those pioneer days his passing was an event of such importance as to be widely chronicled in the papers.

'It was fitting that such a character should receive an imposing funeral,' declares M. M. Quaife, in *Chicago and the Old Northwest*. 'On the day before his death, in response to a request presented in his behalf that he be saved from the potter's field, the city council had voted that a lot and a suitable monument be provided for him in the city cemetery. The funeral was held from the Clark Street Methodist Church, and several clergymen assisted in the service. At the conclusion a procession moved in two divisions from the church to the cemetery, to the accompaniment of cannon booming at one-minute intervals.

'In the procession were the mayor and the councilmen, a detachment of the United States Army, the various military companies and the bands of the city, companies of firemen, and others. Upon this spectacle and that of the interment, which was marked by the usual military honors, a large proportion of the population of the city gazed. The cemetery occupied a portion of the ground now included in Lincoln Park. When the use of this for burial purposes was abandoned a number of years later, nearly all of the bodies interred in it were removed. Kennison's was one of the few left undisturbed.

'The site of his grave had been practically forgotten for many years, when in 1905, with appropriate ceremonies, it was marked by a massive granite boulder, erected by a number of patriotic societies. Thus it has come to pass that Kennison's burial place possesses a prominence of which the humble soldier in life can hardly have dared to dream. Veteran of our two wars against Great Britain, participant in the Boston Tea Party and the Fort Dearborn Massacre, he enjoys the unique distinction of a grave in Chicago's most famous park, overlooking the blue waters of Lake Michigan.'

Artist's conception of the Boston Tea Party from an old print furnished by courtesy of the New York Public Library.

With General Gouraud

(*Concluded from page 7*)

Rainbow Division nicknamed General Gouraud, under whom they served in France, 'The Lion of the Argonne,' and last year had him in the United States as their guest. General Pershing once paid him the tribute of saying he was one of the French generals who knew what real fighting was, but even better than all that, I like to think of him as the fighter and colonial administrator, lacking gold lace and show, who would limp painfully out of his car at some lonely spot to go and talk to a private soldier, empty right sleeve hanging limp, as he stood fingering the medal the soldier wore and asking him about his service and family.

Fifteen or more years ago we Americans used to brag about the Benguet Road in Northern Luzon in the Philippines leading from the plains to Baguio in the heart of Benguet Province along the valley of the Bued River, swung across ravines by suspended bamboo bridges, and twisting by hairpin turns ever higher and higher. I still believe the road in the Philippines is a wonder of the road-makers' art but I also believe that this road from the valley of the Orontes in Syria to the Mediterranean is a greater piece of engineering. We wound and twisted up the sides of hills where we were able to look downward and see the whole motor caravan strung out, each car on a different level and no two in succession heading in the same direction, the turns were so frequent and so abrupt.

This was General Gouraud's first inspection trip over the road and into the country of the mountain people. At the first village where we stopped, all the people for miles had come in to get a look at this one-armed soldier whose fame had spread far and wide through the hills. They respect the general as a soldier, but they respect him more because he has given them schools, something they never have had before.

THIS was the burden of the talk of all the officials, brown men from the hills in queer costumes giving thanks for the schools that enable their children, all the children of the mountains, to learn. And these schools, for the great part in these isolated hills, are conducted by the wives of French officers on duty with the army there. Their task is as arduous as that of their husbands in another field, but the schools are cementing French prestige which the fighting of the Legion started.

The event of the morning was the personal submission of Sheik Saleh, king of the mountains, to General Gouraud and through him to France. The significance of this victory, which was due in a great measure to General Billotte, the direct commander at Lattakia, the capital of the autonomous territory of the Alaouites, is seen from the fact that never before have these mountain people recognized an overlord. From the time of the Crusades they have been free and independent, a law unto themselves in the hills and raiding the coast towns whenever they saw fit. Less than a year before this day when Sheik Saleh kissed General Gouraud's hand in token of submission, the Alaouites had raided the town of Banais, where we lunched later and the general dedicated a new schoolhouse which replaced one burned by the raiders.

In the afternoon we sped north, along the coast for the most part, making only two short stops before reaching Lattakia, which was the northernmost coast point we were to touch. Part of this road was French construction and this was officially opened and inspected by the general. It was late in the evening when we finally reached Lattakia (the ancient *Laodicea ad Mare*), a town of about 25,000 population with a fine municipal building as well as a Roman arch attributed to Septimus Severus. Lattakia is noted especially for its tobacco products and we visited the largest cigaret factory, as well as olive-oil works and soap-manufacturing plants.

I FOUND that the people of the coast know little about the Alaouites of the mountains, except that they have been a terror to the trading centers of the seaside for untold generations. We thought the mountain folk were Mohammedans from their fez wearing but I learned in Lattakia that this was not so. It seems that they made the Turks for all time believe they were Musselmans, but that they have a peculiar religion of their own. It is for men only and cannot be taken up until the male has reached the age of twenty-one. The women are forbidden to become members. Just what the religion is, no one outside its membership knows, and those inside keep the secret well.

On the second morning in Lattakia we started south on our return to Beyrouth, this time along the coast where more roads and bridges were inspected and the cornerstones laid for a school and a hospital. We went into the mountains for lunch at the town of another powerful sheik and were met miles away from his headquarters by groups of horsemen clad in barbaric colors and mounted on swift horses.

They galloped along the road on both sides as it swung around the shoulder of the hills and I did not understand how it was possible for them to make such speed over the rocks until I found their horses are shod with plates so no part of the hoof touches the ground. Here again General Gouraud was acclaimed by an immense crowd of people, and after a late lunch we took the road again with destination as the *Krack des Chevaliers*, which is an immense structure on the top of a lonely hill in the midst of a plain and built by the Knights of St. John.

The road for that late afternoon ride was the worst we encountered anywhere in Syria.

It was mostly over rocks, and several of the cars had broken springs as a result of trying to make even slow speed, because we were well behind our schedule. For an hour before darkness the famous Krack was in sight as the road wound around in the valley, first to the right and then to the left, but never seeming to get nearer. Orders had been given for horses to meet the party, but we were so late that the officer in command had given up and returned to camp before we arrived, so we went as far as we could by the cars.

Then in the darkness we had to make the rest of the climb to the fortress on foot through a ravine which was partially the dry bed of a stream, crawling over rocks and hanging on to a path that only a goat might follow with ease. It took more than an hour to make that climb, the latter part of which was lighted by the moon, and here again I saw the dogged courage of General Gouraud. It brought back to my mind the story of his arm: when he was so severely wounded and was sent to the hospital he asked the surgeons how soon he could get back to the front and they told him it would be about three months before the arm could be made whole. Then he asked how soon he could go if the arm was taken off, and was informed he would be fighting again in half three months. 'Take it off then,' was Gouraud's order.

This dogged soldier, with only one arm to steady him as he climbed around and over the rocks, and with a right leg which drags rather than swings as a result of other wounds, made that climb in the darkness which was a stiff task for those of us who had two feet and two hands. Finally arrived, we had a lecture on the architecture of the Crusades, and at ten-thirty supper after which we went out on the ramparts for a view that cannot be duplicated either in moonlight or the rays of the sun. The citadel rises alone, and for nearly fifty miles in every direction there is a clear view of the country. Towns could be picked out by their lights in the far distance while the valley below was shrouded in shadow and voices came up to us indistinctly. We had started at six o'clock that morning and it was eleven-thirty at night when we had our fill of the view. Then General Gouraud turned to us and said: 'Gentlemen, we will be up to see the sun rise'; and we were despite the fact we slept on hard floors that night, or perhaps because of it.

THE horses had arrived and so we set out mounted to gain the motors on the other side from which we had ascended the night before and rode down a flight of steps with two right-angle turns for at least one hundred steps before we came to the heavy doors which guarded the citadel then more steps down which the horses picked their way, and a long trail down over the mountain.

Then the long road again with destination as Beyrouth at night and we finally made it at ten o'clock that evening after going around Tripoli and cutting out a visit there to lunch with the Maronite Patriarch in sight of the Cedars of Lebanon. Striking into the hills on the outskirts of Tripoli we climbed and climbed through clouds of dust, orange and olive groves, picturesque villages perched on the hillsides until we were 1,400 meters above the sea and came at last to the summer residence of the patriarch who is over eighty and was dressed in his robes of office to receive us. Late in the afternoon we took the road again, and for the last hours were again beside the sea until we reached Beyrouth—and bed.

Who Discovered AMERICA?

By LOUIS C. KARPINSKI

WHO discovered America? Can anyone be positive in his opinion about the identity of the first explorer to touch these shores? To date, more than a thousand articles and a thousand books have been written to show that someone else, not Christopher, discovered us. However, fortunately for Christopher's peace of mind, these books and articles do not agree on the guilty party.

Long before there were any fruit stands in New York, and long before the blacking of boots was invented, Italians from Venice are reported to have visited the American shores. The first printed account of the Zeno voyages appeared in Venice in 1558. These voyages by Nicolo and Antonio Zeno were made between 1380 and 1404. In the Wytfliet atlas of 1597, the first separate atlas devoted to America, Estotiland, which is mentioned in the Zeno story, is identified with Labrador.

The voyages of Marco Polo deserve also to be mentioned in this connection, as much inspiration for discovery and much fiction concerning foreign lands is directly traceable to his entertaining accounts of his meanderings in Asia, two hundred years before the time of Columbus.

An article by M. de Guignes on the subject of navigations of the Chinese to the coast of America was published in 1761 in Paris in the *Memoires de Litterature*, of the Royal French Academy, at Paris.

Some thirty books and articles have been written touching this subject. A glance at the map of Alaska, Bering Strait and the Aleutian Islands shows that here was an easy route from Asia to America. In addition to this, there is striking similarity in certain customs of Asiatics and our west-coast Indians; plants and animals as well as human beings are similar on the two sides of the Pacific. The combination suggests the great probability of direct contact, in centuries before Columbus, between natives of Asia and natives of America, probably even migration from one place to the other.

The actual Chinese invasion in the Fifth Century B. C. is supposed to have taken place in the region of California.

The thesis that Africans first discovered America has recently been elaborated by Dr. Leo Wiener, professor of Slavic Languages and Literature at Harvard, a well-known scholar in Russian and Yiddish literature. The first volume, entitled *Africa and the Discovery of America*, was published in Philadelphia in 1920. The contention is based largely on a similarity of certain words in African and American Indian languages, as well as upon the possible African origin of tobacco, manioc, yams, sweet potatoes and even the humble peanut. Then these early supposedly pre-Columbian negroes are alleged to have greatly influenced the Indian medicine man. Despite the author's scholarship in the fields of Russian and Yiddish literature, historians do not take the author's contentions on America seriously.

Coming back to Europe, an early Welsh chronicle states that Madoc, son of Owen Gwynedh, sailed west from Wales in 1170; 'leaving Ireland on the north, he came at length to an unknown country, where most things appeared to him new and uncustomary, and the manner of the natives far different from what he had seen in Europe.' This story was especially popular in America after the Revolution and the story has been repeated hundreds of times. Parenthetically it may be mentioned that in the Irish folk stories there is a well-known tale of one Brendan or Bran, a monk, who in the Seventh Century reached the world to the west.

In the geography by the famous Arabic scholar Al-Edrisi, written about A. D. 1150, this writer states that eight Arabs sailed to the west to discover the western limits of the ocean. Since nothing is said about the return of these Arabs they can hardly be termed discoverers.

However, the story does call attention to the fact, now well known, that the Arabs were able mathematicians, astronomers and navigators. Their scientific development contributed not a little to make the Columbian discovery possible. The sciences of the Arabs were studied particularly in Spain and in Portugal. The mathematical and astronomical tables of the Arabs and the sciences of arithmetic and of trigonometry as developed by them, and equally their instruments for observation, were all employed by the navigators of the time of America's discovery.

A Polish pilot, Johan Scolve or Szcolny, is reputed to have made a voyage to the New World before Columbus. The reference was first given to Scolve by the Spaniard Francisco Lopez de Gomara in his *Historia general de las Indias*, of 1551. Just a year ago Dr. Sofus Larsen, librarian at the University of Copenhagen, published a scholarly work on *The Discovery of America*

Twenty Years Before Columbus, in which Scolve turns out to be a Norwegian pilot, on an early expedition suggested by the Portuguese.

John Cortereal, a Portuguese navigator, was mentioned by Sir John Barrow in 1819 as discovering Newfoundland in 1463 or 1464. Although many others have referred to the article, little substantiation has been found. However, the recent work of Larsen, mentioned above, revived the interest in the older Corte-Real (his sons were certainly here in 1501) and an early Norwegian expedition, made at the request of the Portuguese Prince Henry.

Similarly an account of a voyage in 1488 by Johan Cousin of Dieppe, accompanied by Vincent Pinzon, appeared in Paris in 1785 but has not received any corroborative support.

The famous *Nuremberg Chronicle* of 1493, a work widely circulated in many editions, refers to Martin Behaim as sailing west and discovering a new world. The globe made by Behaim in 1492 is conclusive evidence that Behaim had no first-hand knowledge of the lands to the west.

The lost tribes of Israel were supposed to be found in the New World. The first book on the subject was published in Venice in 1569. Manasseh Ben Israel wrote a work in 1650 which received the support of an Englishman, Thomas Thorowgood. Later old Americans like John Eliot of New England, the apostle to the Indians, Cotton Mather and Roger Williams, and even William Penn, inclined to this view. The theory was revived in the 18th Century by famous preachers like Jonathan Edwards and Jonathan Mayhew and in the 19th by Elias Boudinot and Lord Kingsborough.

No one today ventures to dispute the fact that in the 11th Century or earlier the eastern coast of North America was visited by Norsemen who stayed for months at a time. The Norse invasion is established with complete certainty. Icelandic narratives concerning these voyages were written as early as A. D. 1215

The earliest printed reference appears to be in a work of 1643, published in Paris, by Johannes de Laet, a Dutchman. At least one hundred and fifty books and articles have been written on the subject. Several monuments with runic inscriptions have been discovered in New England and as far west as Minnesota, showing the Norse invasion.

The Norsemen certainly saw these shores; it is possible and even probable that Asiatics came to our West Coast; Africans may have come to South America from the east, and some unknown European sailor may accidentally have reached our shores long before Columbus. Nevertheless Columbus put the New World on the map; Columbus made the New World a popular resort. Above all, the fact is that America, the New World, was in 1492 ripe for discovery or rediscovery and for exploitation, and Columbus was the fortunate navigator to seize the golden opportunity.

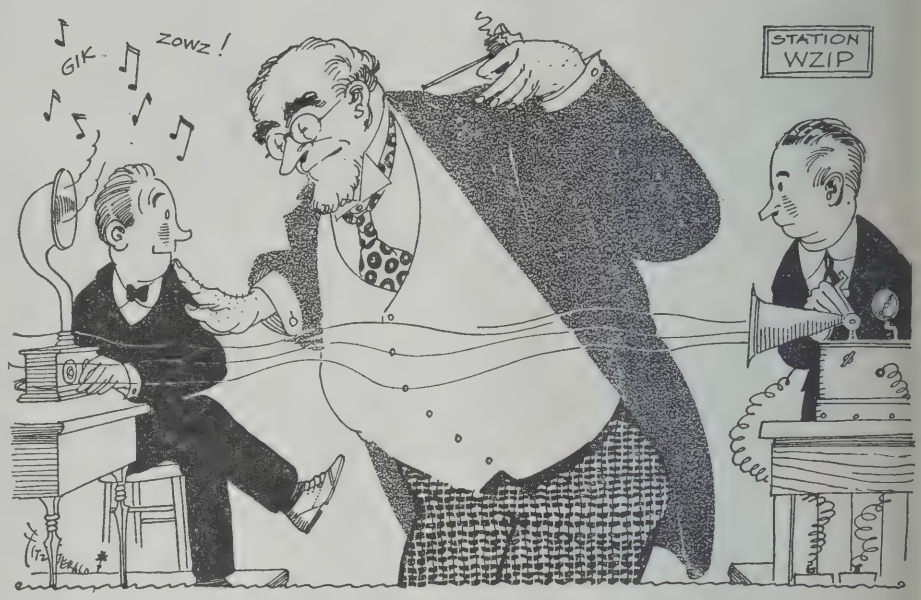
Pirates of the Air

(*Concluded from page 2*)



There can be no satisfactory broadcasting unless both the public and the broadcasters are fairly well satisfied but Congress should begin with the public.

not the best instrument for that kind of work.

BUT Congress cannot do all that should be done for radio. The biggest job of all is in the hands of the broadcasters themselves. They do not seem to realize that they are all broadcasting the same things. Tune in wherever you will and you get the same stuff—music, music, music, of various grades of goodness and badness, thinly sprinkled with 'talks' on this and that, most of which talks could not have been flatter and staler if large prizes had been offered for flatness and staleness. It is an appalling thing to have a set that is capable of getting fifty stations within twenty minutes, only to discover that they are all alike and most of them not worth the current that brings them in.

It is easy enough to see how this situation came about, but that neither justifies it nor makes it more comfortable. It came about because when the broadcasting art was new, music was the first thing to which the broadcasters turned. It was so obvious that music could be transmitted by radio and that people would like it. If there were no musicians at hand—and usually there were not—phonographs were hitched up to the microphones. And when broadcasting began to look up and it was desirable to hire gentlemen to arrange programs, who but musicians seemed eligible for the jobs? Musicians were employed—tenors, bassos, and perhaps others who manipulated the traps, the drums, the trombones, saxophones, and so on. What these gentlemen did not know about music was infinitesimal; ditto what they knew about anything else.

HOW much better it would be if the radio stations were so organized that one could always get what one wanted, just as one selects a book. Let one station transmit classical and semi-classical music all the time another popular music all the time, while another transmits nothing but the news of the day and interpretations of the news. Let one station transmit nothing but short stories—fifteen or twenty minutes long—another nothing but humor, another nothing but scientific and philosophical matters handled in a popular, understandable way. Arrange it that anybody could get on radio what he wanted when he wanted it. Stop this foolishness of pounding out the same stuff everywhere all the time.

The radio gentlemen may tell you that this cannot be done, because broadcasters are seeking advertisers to sponsor and pay for as many as possible of their features. That is no reason at all. The broadcasters have assumed that advertisers could be snared with nothing but musical programs, but this is an assumption that the facts do not justify.

MERELY because advertisers have been found who were willing to pay for the announcement that such and such an orchestra comes to you through the courtesy of such and such a company, this does not prove that advertisers would not be willing to pay just as much for an announcement containing their names in connection with anything else that might be put on the air.

All direct advertising on the air should be eliminated. People have no objection to the indirect form of advertising which confines itself to the statement that the program is transmitted through the courtesy of somebody, but the selling of real estate and furniture over the radio—or the attempts to do so—is intolerable. People resent it, twist the stuff out and the advertiser loses his money. So long as there was federal regulation this sort of thing was not permitted.

If Congress does not stop it, listeners associations will bring it to the attention of both broadcasters and advertisers that it does no good to either of them. Those who listen in have it in their power to control radio

The Comedy of Newspapers

(*Concluded from page 4*)

ent's reply no one was wonder-struck. It is seldom that anyone expresses surprise around a newspaper office. But there was a chuckle.

One dotted line said:

'First reference—Lombard; occupation, king; address, Quirinal.'

Below it was:

'Second reference—Leo; occupation, pope; address, Vatican.'

The Associated Press had another such experience with a correspondent in a small town who was noted for his quaint phrasing and his ideas of news values.

It is customary for correspondents to schedule the main office in their division of what may be expected in news from certain localities, with the number of words which the correspondent expects to write on each subject if the division office wants the story at all.

One night this correspondent wired, 'Girl drowned—100 words.'

Individual drownings are of little value except in the immediate locality. They are of national importance only if the individual is of national importance. Chicago headquarters consequently questioned this item.

'Was girl prominent?' it wired.

'Not prominent but dear to her parents,' he came back.

Jones appeared at the door of the local room only a few days ago. He came to me. There was a scar on his forehead—the deepest I ever saw—and he spoke English with difficulty. He had, he said, been in the poorhouse until a few days previously. While in the poorhouse he had hit upon a salve which was sure cure for blood poisoning. He rolled up a shirt sleeve and showed a healed scar as proof.

He recited other miracles the salve had accomplished.

It struck me he might furnish material for a human-interest story.

'Eddie,' I said to a reporter, 'there may be a story in this fellow. Talk to him.'

The guest repeated his story and rerolled his coat sleeve.

'How did you come to hit upon this ointment?' asked Eddie.

The visitor dropped his voice and leaned closer.

'It was a strange thing,' he said. 'But I had a dream one night. I dreamed there was a lot of wild animals in my room. My poisoned arm was aching. There is a woods near the poorhouse. The wild animals in my room gave me an idea. I got up and went out to the woods. I killed every wild animal there. Well, every one I saw,' he amended. (It seemed he did not want to exaggerate.) 'I took them back to my room and I boiled them all up. They turned into salve. That's how I came to find this cure.

I rubbed the salve on my arm and the soreness went away immediately.'

THE owner of a newspaper in the Middle West had a theory which he worked to the utmost several years ago. He would bring this young cub and that young cub into the local room and say to the city editor: 'Curt, give this kid a chance, will you?' His theory was that embryo talent might be lying around, and his hope was he might discover genius.

One day he brought in Joe, who used to drive a wagon for Sullivan, dyer and cleaner.

'You might give this boy a trial,' he said.

He was the boss, and, of course, Joe was put to work. An hour was enough to convince the city editor that Joe probably was a great delivery-wagon driver, nothing more.

He was patient with the lad, however. The unproductiveness of an hour might be the paralysis of stage fright. It never would do to let Joe go, and have some other paper discover he had the much-sought spark.

The city editor had his own head to think of. He let Joe stay two days.

'He'll never do,' he finally reported to the owner.

'Well, give him a couple of weeks' pay and let him go,' the owner said.

Joe went back to Sullivan and asked his job back. He got it, and Sullivan followed him out to the wagon.

'What's the matter, Joe? Didn't you like the newspaper business?' he asked.

'Like it!' Joe exclaimed. 'I'm sorry I ever learned it.'

Hector was different from Joe. He was a university junior, come to spend the summer on the paper, and had a flair for verse. He came to us with slightly the wrong idea. He came with the notion that what a newspaper wanted was profundity, which isn't true, for its readers do not want profundity.

The city editor was a thorn in his side. The second day he sent Hector to an underworld resort to see if he couldn't get a picture of a man who had been mixed up in some crime. Hector went and probably was glad when he found the place was closed. He came back, so reported, and sat down to compose a little poetry to a silken cloud which scanned freely.

At five in the afternoon the city editor went to him again.

'You better go back over there and make another try for that yegg's picture,' he advised Hector.

Hector's face took on a pained expression.

'Yes, sir,' he said, 'but I had been hoping you wouldn't ask me. It's a very rough neighborhood.'

But my mind always goes back to the gray-haired old lady. She was pathetically halt, pathetically wistful. She came when America was at war and at a time when everyone had a picture of a soldier they wanted printed. Each believed, of course, there was something to recommend his or her particular picture, forgetting the obscurity of the khaki-clad atom in the mass.

Many of the pictures were run, nevertheless. The old lady had one in her hand, folded in a brown paper, and she had another piece of paper on which something was written in her own cramped hand. She asked if the newspaper published pictures of soldier boys, and she was told that occasionally the newspaper did. It was hard to deny her, the way she looked at you, and the way her hands shook.

Would the editor please run this?—He would. She put her burden on the desk, after the editor had promised to see that the picture was safely returned to her. And then she limped out. Her step seemed a little lighter. The editor unwrapped the paper.

The picture inside was of a young man in the blue of the Civil War, and on the accompanying paper in the old lady's hand was this:

'To Harry, who died bravely at Appomattox in the service of his country.'

He was still the old lady's soldier boy.

The American Race

(*Concluded from page 6*)

whites in the country. The total of 17th-Century immigration probably was less than 75,000; that of the 18th Century probably did not exceed 125,000.

Thus the more than 3,000,000 white inhabitants in the country in 1790 resulted in most part from natural increase, which prior to and long after the Revolution was phenomenal.

'Their numbers are not augmented by foreign immigration,' wrote George Washington of the New Englanders in 1796. 'Yet from their natural population they are filling the western parts of the State of New York and the country on the Ohio with their surplusage.'

The descendants of the 40,000 original settlers in New England then numbered around 2,000,000.

IN HIS historic *Essay on Population*, Malthus, who wrote in the first years of the 19th Century, said of the increase in America:

'In the back settlements where the sole employment is agricultural and vicious customs and unwholesome occupations are little known, the population has been known to double every fifteen years. It appears from recent calculations and estimates that from the first settlement in America to the year 1800 the periods of doubling have been very little above twenty years.'

Adam Smith said practically the same thing in *The Wealth of Nations*, published in 1776. 'Nor in the present time,' he added, 'is this increase principally owing to the continual importation of new inhabitants, but to the great multiplication of the species. Those who live to an old age, it is said, frequently see from fifty to a hundred, and sometimes more, descendants of their own body.'

The high rate of natural increase continued for some time after the Revolution. In some branches of old American stock the rate still is high. For remember that the 3,172,000 of 1790 have grown into what are tantamount to 50,000,000.

What would the last figure be had there been no immigration, which practically all students agree had big effect on the rate of natural increase among much of the old American stock?

And what is the prospect, as shown by statistics to date, of that old stock being 'outbred' by new stock?

Some interesting studies as to these questions have been made. The findings will be set forth in a succeeding article which will deal chiefly with the development of the population since 1790.

(*To be concluded in an early issue.*)

How Victoria *Trained* King Edward VII

The Queen *Thought* Prince Albert *the* Model *of* Perfection, *but* Young Wales *Did Not Respond*

By GAIUS GLENN ATKINS

The world from which he was to be kept was a world of kings and queens secure upon thrones which had defied the centuries.

Illustrated by J. A. NEILSON

THIS has been a hard world for kings of late; people are more interested in the radio than royalty. There is a feeling generally abroad that kings are one-cylinder cars in a six-cylinder traffic, no up-to-date nation wants to ride in one. Besides, a 'close-up' of a king or even a queen is often fatal to romantic conceptions of royalty. Old King Henry IV was quite right; a king—like a popular actor—should be seen only on his proper stage. Put him in plus-fours and lose him in a crowd and nobody would look at him twice. But the glamour has not quite gone. A Prince of Wales with a human way about him can still get headlines in the newspapers of a republic—perhaps a headline is our new fashion of coronation—and if you see the biography of a king in a bookshop you are pretty sure to pick it up.

Kings have, moreover, made a deal of history between them, the aftermath of which we are still reaping, and the historians will be busy for a long time yet auditing their accounts; and when a king has sat upon an historic throne which is still right side up, and been so considerable a force in the direction of world affairs as was the late King Edward VII, and a 'good mixer' besides, living through a long and pregnant period, his biography is more than the life story of a king. It is a cross-section of the whole history of his time.

The first volume of the official life of the late King of Great Britain, by Sir Sidney Lee, is for these reasons one of the significant works of recent years, and though the sheer bulk of it is forbidding, its contents are rewarding. It is official, for it was written at the request of the now reigning king and the author had access to documents and sources of information which would attend such a request. This gives the book a solidity other biographies cannot for the present possess.

Very likely Sir Sidney Lee has been influenced by the conditions under which he has written. He would naturally treat his subject with a grave and discreet restraint. There is no back-stage gossip in his pages, nor any reference to those amiable weaknesses of kings which, since the days of King David, have grieved the moralist and delighted the irreverent. When Sir Sidney Lee has to touch at all upon those dubious situations into which Albert Edward managed now and then to get himself, he writes as one in sorrow that the heir to the throne had not been more choice in his associates and goes on to less delicate matters.

But these are details. Slowly, but very solidly and convincingly, a commanding and engaging figure begins to show through his pages. Innumerable influences and interests converge upon the man whose birth was certified to by four physicians at 10:48 o'clock, Tuesday the ninth of November, 1841, and whose death—May 6, 1910—dates the end of an epoch in the history of the world. The first volume ends with his accession to the throne, January, 1901, and in its account of the forces which made him what he was, and his long attendance at the foot of his mother's throne, and the currents of the times through which he lived, and the fields of action and interest which he found for himself, and the influence he came finally to wield, though uncrowned, is a telling recital of the making of a king.

The book needs for a background Lytton Strachey's *Life of Queen Victoria.* That book is not official; King George never asked to have his grandmother thus set forth before the world, and still less his grandfather. Not that he could quarrel with a word of it for want of respect or truthfulness or even affectionate loyalty. But there is no setting of screens and drawing of shades to get just the right lights upon Strachey's figures. You see them for just what they were. The portraits which illustrate his books are proper enough. Th Queen and the Prince Consort with jewele orders and the Queen in a coronet or diade or some informal sort of a crown, and thei living jewels, curled and posed, gathere about their knees, or the Queen riding i Windsor Park, maybe, on a horse whic knows he is carrying royalty, or the Princ Consort in a befrogged uniform and te feet of gold braid.

But the pictures Strachey draws himse are different—a raft of family relation some of them poorer than the palace mic a strong-minded, capable, short, litt woman, the issue of thick-headed Hanov rians, who was in her youth such a contra to her forbears, whom Strachey calls plainl enough pig-headed, that England thanked kind Providence in grateful rapture for th death of the whole lot of them, and wh proved, before she died, that blood will tel the Prince Consort, a most estimabl character bent on improving his own min and the minds of nobody else, stiff as ramrod; and little Bertie—a sport on th family tree.

The young prince was born into a atmosphere of complete domesticity. Th Queen loved nothing better than to sit doin

cross-stitch while her husband read aloud to her Hallam's *Constitutional History of England*, or played the organ. The Queen sewed and adored and 'could only pray that the prince would grow up to resemble his angelic father in *every, every* respect, both in body and mind.'

The lack of an answer to this petition must have shaken the Queen's confidence in prayer, and the attempt to answer it by taking the will of the Almighty for granted and making Bertie like his 'angelic' father, whether or no, is the key to a vast deal of misdirected energy in the nurture of the prince and, probably, to unhappy lifelong misunderstandings between the prince and his mother. For Bertie was never like his 'angelic' father.

If Victoria had never been a queen she would have been the shrewd, stodgy and somewhat dowdy mother of many children, thrifty, masterful and entirely competent, living largely in her family and gradually exchanging her slim, blond prettiness for a solid middle-age figure and double chin. She would have shown her will in the management of her children and her household, and her dependence in a thorough prayer-book devotion to her husband.

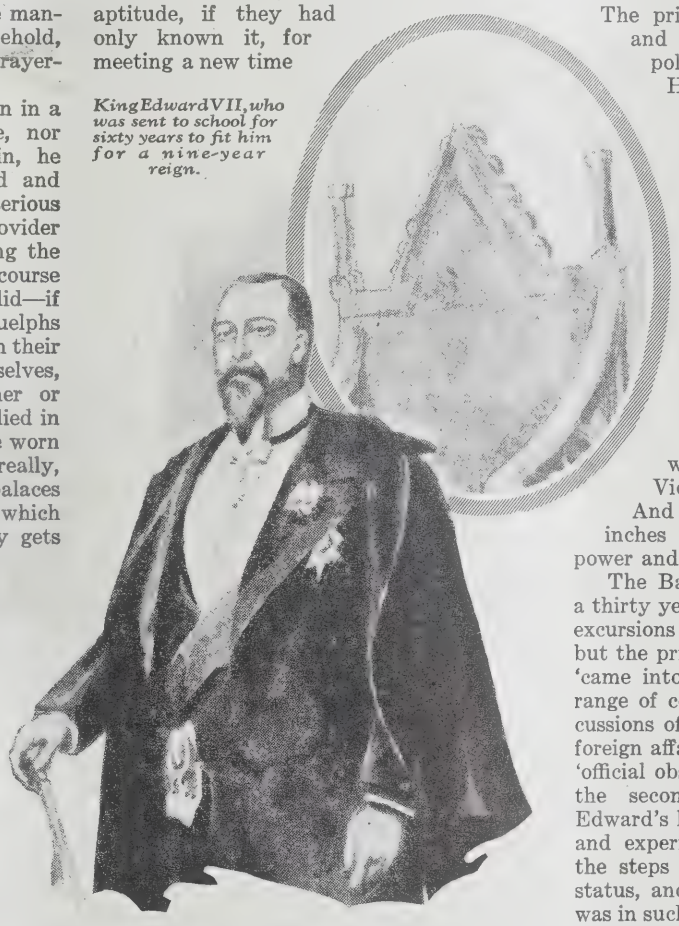
If Prince Albert had not been born in a plain and somewhat shabby palace, nor married the Queen of Great Britain, he would have been an earnest-minded and capable gentleman, desperately serious about his business affairs, a good provider and a most painstaking father, taking the devotion of his wife as a matter of course and showing her her place—as he did—if she presumed too much. The Guelphs would not have been very popular with their neighbors, living too much to themselves, and if—as it turned out—commoner or king, the head of the household had died in early middle life, the wife would have worn mourning till she died. This was really, when you strip away the setting of palaces and courts, the kind of family life in which Edward the VII grew up. Strachey gets down to the essentials of it far more directly than Lee, but there is no separating the essentials from the circumstances. Victoria was a queen and a very great one, her husband was the Prince Consort, the boy was to be a king himself, and Windsor and Buckingham were palaces, the centers of world administration and seats of enormous power. The family was related to half the reigning houses of Europe and presently to be related to about all the rest. The Prince Consort was a German, his daughter, Victoria, Jr., married the Crown Prince of Prussia, son of the first emperor of Germany and father of the last.

A royal household would be the center of as many lines of incoming and outgoing affairs as a switch tower at the Grand Central terminal, and somewhere at the center of it all was a friendly, good-tempered, blue-eyed boy who would have been the leader of his set if he had been born on a boulevard, but who was a problem to his literally Victorian parents because he was born in a palace.

His boyhood was a study in cross purposes. Time was to reveal what distinctive powers he really had and what weight of wise influence, if he were allowed to work in his own way. But that was neither his father's nor his mother's way. His mother never could believe that Bertie had grown up; his father feared he never would grow up.

The world from which he was to be kept was a fascinating, fermenting world, a world of kings and queens secure upon thrones which had defied the centuries and seemed more firm than ever. There was a Napoleon in Paris, a Hohenzollern in Berlin and a Romanoff in St. Petersburg, and uncles and aunts and cousins in little German capitals whom the boy might decorously visit as he grew older, with some natural hesitation about Paris.

But there was also a ferment of democracy which irritated Windsor Castle and Buckingham Palace, and a new science which challenged old orthodoxies, and inventions and industries, and deep premonitory shiftings of the balance of power as though a ground swell began to stir in some hidden quarter of the sea, and a boy who had a keen, natural aptitude, if they had only known it, for meeting a new time



King Edward VII, who was sent to school for sixty years to fit him for a nine-year reign.

with a newer spirit than his anxious parents or his learned tutors—and he must be kept out of its currents.

Besides, he was not made for books. He did become widely read in the book of human nature. Turn him loose among people and he observed viewpoints easily and surely. He was a friend of the arts as they lived in artists and actors, and archeology was real enough if he saw it in Egypt, Greece or Palestine; but books were another matter.

His real education was in travel and what any boy born to a throne could not help absorbing in a court. He learned to shoot and to ride, but he never was so good a shot as his son, King George, and certainly never fell off a horse so often as his grandson.

He always wanted to be a soldier, and was always happier in putting on uniforms and acting as honorary colonel or general, than anything else. But he was sent to Edinburgh and Oxford and Cambridge instead of Aldershot. In these illustrious seats of learning he was expected to specialize in about every branch of human learning.

His visit to Canada and the United States was a happier study of modern history, and a tour of Egypt, Palestine and Syria a course in ancient history to which the prince took whole-heartedly.

Meanwhile his father died, his disconsolate mother went into an almost lifelong mourning and his family and the nation between them set him up with estates and revenues and a wife. His German relatives were touchy over his marriage to a Danish princess, but Alfred Tennyson wrote a poem about it and Great Britain rejoiced whole-heartedly and shone from John o'Groat's to Land's End with bonfires and illuminations.

The prince was naturally a politician, and he saw a fascinating game of politics being played about him. He was somewhere at the center of a web, spun by ministers and diplomats and kings and emperors and parliaments, which reached around the world, and he was impatient of being kept on the edge of it. He wanted 'direct and regular access to official papers and dispatches.' Prime ministers sympathized with him, but his mother held out against him. She distrusted his discretion and, besides, those red boxes full of momentous and sometimes explosive documents were the royal prerogative, and Victoria was every inch a queen. And if she were literally short in inches she made up for it in pride of power and station.

The Battle of the Dispatch Boxes was a thirty years' war. There were alarms and excursions and truces and renewed drives, but the prince was fifty years old before he 'came into authorized touch with the full range of confidential deliberations and discussions of the ministry on both home and foreign affairs.' For a generation he was an 'official observer.' Here is really the key to the second significant phase of King Edward's life. He waited as a man of force and experience for almost forty years on the steps of a throne; he had no official status, and yet no Englishman of his time was in such far-reaching touch with the men who made the history and directed the affairs of his time. He had tremendous latent authority, for he might be king tomorrow, but today he was only the Prince of Wales, with a touch of his far-off ancestor Prince Hal and a similar liking for somewhat Falstaffian friends.

His mother was quite willing that he should represent her socially and go through the endless ceremonials which are never complete in England without a representative of the crown, but 'she succeeded in defeating every proposal for his employment which involved sustained and continued responsibility.' The world knew him, therefore, as a courteous, pleasure-loving gentleman, and as a model of sartorial elegance.

The Adventure of Mrs. Farbman

(*Concluded from page 15*)

like yourself and your friend are abhorrent to me.'

'Why?' I asked, coming forward.

'You are useless, conceited, and ignorant!'—finishing her words with a snap, as though they were final.

'You can't expect me to agree with that,' I answered. 'Chippet and I have a very decent opinion of ourselves.'

'What are you doing here?' she asked, suddenly turning round and looking at me. 'What are you here for at all? You don't like Mrs. Fleming, you laugh at her husband, and yet you come here every day. Why?'

'Maybe to see you, Mrs. Farbman.'

'Stuff!' she replied. 'You are neither of you intelligent enough to interest me, and unless I am interested I am not attractive. I am quite aware of that. Besides, it's been perfectly obvious that you have both disliked me intensely from the very beginning. Are you trying, for some purpose of your own, to get me out of this house?'

'Suppose I am,' I answered, 'is there any chance of my succeeding?'

'Yes,' she replied quickly, 'if you can offer me anything better. If you want to know the truth, I have been for many months now so bored here that I could scream. I'd leave Mr. Fleming tomorrow if I could fill my life some other way; but I simply can't face the loneliness and emptiness that would come after all my occupation here. Of course I've been cheating myself. I've been pretending to myself that Mr. Fleming's work is important—which it isn't in the least—and I've liked the sense of authority that I've found here. I like ordering about, but I know quite well that even Mr. Fleming will be delighted to see the last of me, and Mrs. Fleming, of course, will light such a bonfire of ecstasy when I'm gone that it will illumine the whole of Golders Green for miles around. But where am I to go? What am I to do? I've been calling myself for years a modern woman, and there's another side, you know, to the modern woman question that many people don't consider. We go in for men's work, men's lives, men's ways of thought, and then we have to cling on like drowning men to a raft, cling on to a boat that's overcrowded already, the occupants of which are always digging at us with boathooks to push us back into the sea again, and shouting with joy when we drop off and drown. There's room for a few of us, but not for many. Besides, as you have probably already observed, I am not really clever enough. I have got a muddled, feminine brain. I cover my ignorance of facts with lots of talk, and hope the people will be taken in. I can't expect at my time of life, and with my appearance, to take anyone in as thoroughly as I've taken Mr. Fleming, and even he isn't taken in any longer, as you see. If I lose my hold on this little boat, I drown altogether. At my time of life I must think no longer of love and marriage. Well, then, where am I?'

'I'll tell you where you are,' I answered. 'You're going to dine with me tonight at the Vin Blanc in Soho.'

At the word 'dine' she sat up and looked at me eagerly. 'The food here is awful, isn't it?'

'Yes,' I answered slowly, 'except for the curried eggs last night. But there are better things than curried eggs at the Vin Blanc. There is, for instance, *sole meuniere* that is quite excellent, and they are better at whitebait than anyone in London.'

'Do they have nothing but fish?' she asked.

'Oh, yes,' I replied. 'Come and see!'

We looked at one another steadily for quite a long time.

'You're a clever young man,' she said. 'You're observant. You will get on. I will dine with you tonight.'

THE next scene of this voracious history was played out in the little, white, low-ceilinged upstairs room of the Vin Blanc. A new actor was added to an already competent company. This was little Monsieur Pierre Duhamel (no relation, by the way, to the author of *Vie des Martyrs*), the proprietor of the Vin Blanc. I have known Monsieur Duhamel through a considerable number of years. He was a cheery little soul, round and chubby, wearing always an immaculate white apron, a little black tufted beard on his chin. He had come from Paris ten years ago, had made his little Soho restaurant pay, but had never extended it, as he might have done, to something of a large and extravagant order that would have given him very quickly enough money on which to retire for the remainder of his days. He did not wish to retire. He made enough for his living; he was unmarried and preferred, as he explained to me, 'to enjoy his leisure hours.'

Now, he had always burning in his soul a curious passion, and that was to marry a truly intellectual woman. He was an immense admirer of the other sex, but always from the standpoint of brain rather than of body. Physical beauty meant nothing to him, or so little as not to matter, but a clever woman, or even a stupid woman who seemed to him clever, excited him to a frenzy of admiration and desire. What he liked best was to have as a habitual customer some member of the opposite sex who, while she discussed his *sole meuniere* and his Chateaubriand steak with real human appreciation, was also able to give him a little philosophy, a few words about the advancement of women, and a hint or two as to Bergson. The unfortunate thing was, as he had so often confided to me, that intellectual women were so seldom interested in cooking, 'and, after all,' he explained to me, 'I have nothing to offer such a woman except a good meal, a kind heart, and an attentive manner.' On one occasion, I remember, I had brought into his restaurant the lady principal of a famous women's college. He had given her such a meal as I have seldom enjoyed anywhere. It was pathetic to see the way in which he hovered round her table, hoping that everything was perfectly delightful, and then venturing a word on Bergson's book on laughter, being crushed by her quite natural gasp of astonishment and air of nervousness and look at me for reassurance. 'What a droll little man!' she whispered to me. That was the fashion, alas, in which all learned women considered Monsieur Duhamel.

I will confess to you that on this evening I was immensely excited. What would come of my plan? It might so easily fail. If it failed, my last card was played. It did not fail. Monsieur Duhamel's first glance at Mrs. Farbman told him that here was an intellectual woman indeed. Mrs. Farbman's first glance at the *sole meuniere* told her that this was a restaurant *sans peur et sans reproche*. I would not like to say that she was a greedy woman. I have never been able to understand why a really esthetic appreciation of food should be held to count against a man. I fancy that good food beautifully cooked was Mrs. Farbman's approach to the spirit of beauty, and it was an approach that had been throughout her hard and rather dreary life consistently denied to her. You could see from the way in which she ate her sole that she was not considering so much the perfection of the sole itself, but that it placed her in relation to all the beautiful things in life from which Mrs. Fleming's scrambled eggs had so long isolated her. As for Monsieur Duhamel, before the sole was finished, his face beaming with smiles, he had inquired as to whether Mrs. Farbman had yet mastered Einstein's 'Relativity.'

Of course Mrs. Farbman had not mastered it, being in that at least entirely at one with all her fellow human beings, but she had a great deal to say about it. A flood of words poured from her, words to myself quite meaningless and to herself nearly so, but sentences long and involved, containing capital letters and quite a number of proper names. Monsieur Duhamel's ecstasy was a thing to envy. 'But I see, madam,' he cried, 'that what you say is a profound truth. You have enlightened my mind. I cannot thank you sufficiently. If you knew what it was for one who is so persistently denied food for his mind by his inevitable pursuit of food for the body to meet someone as wise and brilliant as yourself . . . '

I was soon forgotten by both of them, and when at last I pleaded an engagement, Monsieur Duhamel suggested to Mrs. Farbman that she should drink a cup of coffee in his own little room just above the room where we were sitting, I left them together.

* * *

What more need I say? Simply this, that long before the three months were out Mrs. Fleming had delivered to us the check for one hundred pounds; that the Fleming household was a paradise such as I never could have imagined; and Mr. Fleming in spite of—or shall I say because of?—the departure of Mrs. Farbman, progressed with his book at double the speed of the earlier days; and that, finally, I was asked, on one beautiful summer day, to a wedding breakfast in the private room of the Vin Blanc, a breakfast that excelled both in the superb excellence of its cooking and in the vigor of intellectual conversation any meal that I had ever attended.

The Birthplace of the Quaker Poet

(*Concluded from page 8*)

by the poet's grandmother, Sarah Greenleaf. From these windows Aunt Mercy saw the vision of her lover on horseback entering the yard with noiseless hoofs and pausing at the door. A few days later she learned of his death at the same hour. As in most New England families, the isolation and terrors of the wilderness had deepened the touch of native mysticism, and warnings and apparitions gave a touch of romance to an uneventful life.

In the parlor is a table brought by Whittier's mother as a bride in 1804, and the sheets she spun and wove, marked with her initials, A. H. (Abigail Hussey), are in the red pine chest that Sarah Greenleaf brought a generation before when the house was new. There is a picture, taken from a miniature once the possession of the poet, of Evelina Bray, his boyhood sweetheart. She was the daughter of a Revolutionary veteran of Marblehead, and among the Quakers marriage outside the Society of Friends was frowned upon, while in the eyes of her family he was a country boy without prospects, obtaining a scanty education by making shoes.

One morning in June he walked from Salem to Marblehead to see her. She could not invite him to her home, but they wandered over the hill and by the fort, and a few stanzas in 'A Sea Dream' tell Whittier's memory of that day. Years later, when he was editing *The Pennsylvania Freeman*, she chanced to sit beside him in a church in Philadelphia, but she did not make herself known. She had married an eccentric clergyman who appealed to Whittier for financial help in his work, adding as a postcript, 'Did you know Evelina Bray?' In Yankee fashion Whittier replied, 'What dost *thee* know of Evelina Bray?' and the answer came, 'She is my wife.' More than forty years after their parting at Marblehead, Whittier persuaded her to attend the reunion of their class in Haverhill Academy.

Whittier never married, although he was by nature more sympathetic with women than with men. In the home of Mrs. Claflin, wife of the governor, on Mt. Vernon Street in Boston, he found true hospitality and met many of the personages of his day. He knew Holmes and Longfellow, but not intimately; he was more at ease with Emerson, and he was fond of Bayard Taylor who, like himself, was of Quaker parentage. But his mother and his sister Elizabeth were his companions at Amesbury where they moved to be nearer the Quaker Meeting House, but his friends were Gail Hamilton, Lucy Larcum, Alice and Phoebe Carey, Lydia Maria Child, and Celia Thaxter.

Many of his best poems show this pleasure in the companionship of women, and the scenes in his works, as 'The pines were dark on Ramoth Hill,' are always the scenes of his boyhood. In 'Telling the Bees' there is an exact description of the Whittier homestead, the garden in the rear, Fernside Brook with the stepping-stones, and the path by the old stone wall. If you follow this path to the right you will come to a walled-in plot, bright in autumn with golden-rod and sumac, that is the family burying ground. On a granite monument beneath an oak are inscribed the names of four generations, beginning with Thomas, the builder of the house, and closing with John Whittier and his wife, Abigail Hussey. Their son, the poet, is buried in Amesbury. About half a mile up the road is the old brick house where lived Lydia Ayer, the little maid of the quaint speech,

> 'I'm sorry that I spelled the word,
> I hate to go above you.'

Perhaps women, more than men, could sympathize with the repeated thwarting of the poet's desires. 'Disappointment in a thousand ways,' he wrote, 'has gone over my heart and left it dust.' Almost all his life he was bound by poverty, the earnings of an abolitionist's pen barely sufficing for the support of the household. A well-to-do Quaker from England, Joseph Sturge, visiting in Amesbury and seeing how cramped the family was for room, gave Whittier a thousand dollars to enlarge his house. Only with the publication of *Snow-Bound*, when he was old and his sister and mother had both passed on, did relief from financial concern come. Then, too, he had a genius for politics. He was called the 'high priest of the Republican Party,' and perhaps aspired to honor himself, but his health made it impossible. That was a disguised blessing, as blessings so often are, for it gave him a chance to let his thought go back to the farmhouse beneath Job's Hill, and we have such poems as 'In School Days,' and 'The Barefoot Boy.'

Whittier was less cultured than his contemporaries, but he had a deeper sincerity, and the very narrowness of his training made him more intense. There remain in the birthplace a few of the books that formed the family library, one novel among them, disapproved by the parents and read surreptitiously by the children. For periodicals there were the almanac and the weekly newspaper, the *Newburyport Free Press*, to which Whittier sent his first poem. William Lloyd Garrison, then twenty-two, was editor, and he drove out fourteen miles into the country to hunt up the new contributor who, very much embarrassed, was called in from his farm tasks to meet him. Garrison suggested to the elder Whittier that so promising a poet should have more schooling. 'Poetry would never give him bread,' was the stern reply. But it was later arranged that the lad should attend Haverhill Academy, earning his way by making shoes.

In the kitchen of the farmhouse genius was first kindled when a wandering Scotsman, over his mug of cider, sang 'Auld Lang Syne' and 'Highland Mary.' Later the schoolmaster loaned the boy a copy of Burns, and he saw that there was beauty in common toil and common people. And so we have the perfect record of New England rural life, the scenes and characters all of the neighborhood.

In a corner of the kitchen stands its choicest possession, a desk which belonged first to Joseph, son of the pioneer, and was then used by his son, his grandson, and his great-grandson, John Greenleaf. In middle age, when the poet felt like spending money a bit recklessly, he bought himself a new one and gave the old one to his niece who had it renovated and later returned it to the donor. He was delighted to see it again and on it wrote his later poems, among them 'The Eternal Goodness,' which, with 'Snow-Bound,' has made him our best loved poet.

Sparrow House in Winter

Rosemary Thomas.

TWO hundred miles from me now
A little house stands
White and small and lŏw-roofed
Against the moorlands.

Empty are its rooms,
Closed are its doors,
But shining are its windows
And polished are its floors.

The pickets all like soldiers
In uniforms of white
Proudly guard the little house
That stands so clean and bright.

It is never lonely,
For the wind's tune
Sings to it about the tides
Pulling from the moon.

CHATS WITH OFFICE CALLERS

A new industry has sprung up of late in the United States,' said ***the Business Man from an Eastern State.*** 'It is the spreading abroad of rumors about your competitor. You would be surprised to know to what an extent this industry has grown. Some of the biggest advertising agencies of the East have had to do regular detective work to run down the source of the propaganda which was neutralizing their best efforts. For example: one of the best-known brands of cigarets suddenly dropped 80 per cent of its trade in an Eastern city because of a rumor that it had caused some disease of the tongue. The rumor was traced to a loving competitor. It was a systematic piece of misinformation, systematically distributed. Another concern suffered in an entire section of the country because a false report was circulated that it refused to hire Catholics. Several very large stores were reported to be anti-negro because they were not using the negro newspapers of Harlem for their advertising. Certain negro associations demanded redress and got it. Not only was advertising given to the negro press, but in response to a demand, negroes and negresses were placed on view in the stores—not as janitors, but in positions where the public could see them. There are more things happen in business than you read in the newspapers, although sometimes the newspapers themselves lend their columns to the propaganda of misinformation which is invented by one interest against its competitor. Maybe you know what I mean.'

'The first need of aviation now,' said ***the Air Expert,*** 'is a school for pilots. We are now in need of pilots, with no adequate means of training them. The day of the dare-devil flier is over. The pioneer in all these developments represents a certain type which does not do very well under the disciplinary requirements of a more mature period. It is inevitable that a new and untried and apparently dangerous method of transportation, such as flying, should attract the more adventurous characters, and that they should have all the defects of their virtues. It was so in the early racing period of automobiles. That day, however, is past for automobiles, and it is also passing from aviation. When proper schools are provided and pilots thoroughly trained, an entirely new type of individual will constitute our flying groups.'

'What I cannot understand,' said ***the Metropolitan Publisher,*** 'is that I can get all the trained journalists I want—the woods are full of them—but I can't get a trained business manager for my newspapers. To get a competent newspaper manager today, it is necessary to buy him away from some paper that has trained him, and one doesn't like to do that. Yet upon the business manager the modern newspaper largely rests; it is he who gives editorial achievement its chance to show itself. The editorial side has been heard of to the exclusion of the business side, yet some of the greatest newspaper romances are to be found in the business office. I know of no school of journalism that is training business managers. They train men to write news stories; they don't train men to write the checks that pay the news writers. Perhaps newspaper management cannot be taught, but still I think I could pick up a dozen or two men in this country who could give very creditable courses in newspaper business management to young men who might be interested. Just at the moment I cannot recall a single instance of an active business manager being invited to address any school of journalism.'

'Let me give you an illustration of the way the Oriental mind works,' said the ***World Traveler,*** just back from Asia Minor. 'I was crossing the desert on my way to Bagdad when I came on a party of men, women and children in a broken-down automobile far from any habitation. They had been there four days without food and the children were crying piteously. I gave them what food I had and sped on to the next station. I notified the native police.

' "Yes, we know they are there," they replied. "Yes they have been there four days, but no arrangements have been made."

'That is typical of the Oriental. They refused to aid without bargaining in advance. I was a bit indignant. I sought the British official who had heard nothing of the stranded party. He sent for the native chief of police. The wily chief came and when the British officer took him to task for his negligence the chief said,

' "Why I sent three automobiles to pick up those people."

'He had done all this the moment he saw me talking with the British officer. We proceeded on our way and presently in the desert our own car broke down. It seems that our chauffeur had sold his new tires in the village we just left, intending to purchase more at the next stop but could not make it. We crawled back to the village and the British officer took us into his home, and arranged transportation to the seacoast for us. So the bread we cast upon the waters—or sands, if you please—came back to us.'

'Roses and moonlight,' reflected ***the Poet,*** 'are responsible for more bad poetry, perhaps, than any other subjects. And yet, if we eliminate roses and moonlight from poetry, we should lose much very good poetry.

'After all, poets have always written about practically the same things; about eternal things; about the realities of existence. Always the really great poem strips away the temporal things of life and attempts to bring people face to face with realities.

'It is the little things that make the great chapters in human existence. So poetry is not about subjects at all, but about human emotions, human conceptions. For those things that are most properly ourselves are spiritual realities. Hence we discover that similarity, within variations, makes great poetry; and it is poetry that binds men together in the scheme of life.'

The Visitor from Scotland said he had been recently in Glasgow. 'But Glasgow is not typical of Scotland,' he remarked, 'any more than New York's East Side is typical of the United States. One of the reasons is that Glasgow, like all large seaports, has a considerable mixture of foreigners, but the principal reason is the Irish.'

'The Irish?' we asked.

'The "Irish menace" some of the Scottish newspapers are calling it. The whole situation is what may be compared to a super "Irish Bull." The Free Staters gave Britain no rest until they got self-government, and as soon as they got it they started leaving Ireland and coming to Scotland at the rate of 4,000 and 5,000 a year. This has been the rate of immigration for the past five years, and the heads of the various sections of the Scottish Presbyterian churches are getting very much alarmed.

'In order to drive home the findings of the General Assemblies, a deputation representing the Church of Scotland, the United Free Church, and the Free Church, recently waited on Sir John Gilmour, Secretary for Scotland, and asked him to urge government action. The Secretary gave a guarded reply, but it is very unlikely that the matter will end there.

'The deputation took pains to point out that there was no religious bias in their action, and that the question was "purely racial." They said that there was a danger of Scottish nationality and Scottish characteristics being swamped by the Irish invasion if it were not restricted. The Irish are willing to work for less money than the Scotsman, and as a rule they do not represent the best that is in their own country.'

'In late years,' said ***the Insurance Expert,*** 'the fire losses in the clothing trade, especially in New York City during periods when "business is bad," have been the scandal and the worry of the insurance world. Only the other day announcement was made that the United States had won first place from Europe in the fur industry. Simultaneously came word that increases of from 50 to 300 per cent in burglary insurance rates on furs had been placed in effect.

'The news that a sharp rise in rates was contemplated, due to the growing number of fur thefts, was made after a conference of forty-six companies represented in the National Bureau of Casualty and Insurance Underwriters. The new schedule provides for a 100-per-cent increase on the first $20,000, and a 300-per-cent increase on all amounts above this figure in the larger cities throughout the country, known as "Territory I." It is significant that the new rates apply only to burglary insurance, as robbery insurance rates on furs were increased some time ago. It is conceded by police officials and insurance authorities that these conditions are due primarily to the existence of "fences," who purchase the stolen furs from loft robbers and dispose of them later to the public in fur shops opened in the more distant cities to which they are sent surreptitiously.'

CAN YOU TELL ME?

QUESTION: Does the United States owe any money to France for the debt on the Revolutionary War?

ANSWER: With the exception of interest payments on $3,267,000 for a period of approximately five years, which France remitted, and commissions and bank charges incident to a loan of $1,815,000, which France agreed to bear, the account was paid in full. Due to the condition of the finances of the new American Government, interest payments on the loans from France, as well as installments on the principal and interest, with the exception of the interest remitted as shown above, was ultimately settled in full.

QUESTION: When did the *Tuscania* British liner) sink, and who were drowned?

ANSWER: The *Tuscania,* a British ship carrying American troops, was sunk off the coast of Ireland on February 7, 1918, and four officers and 208 enlisted men were lost. Some members of the crew also lost their lives.

QUESTION: How many cities in the United States have over one million inhabitants, and which is the larger, Chicago or Detroit?

ANSWER: According to estimates of the Census Bureau there are four cities in this country having a population of more than one million. They are New York, with a population of 5,924,000; Chicago, with 3,048,000; Philadelphia, with 2,008,000 and Detroit with 1,290,000.

QUESTION: Have federal tax collections increased this year?

ANSWER: Yes, by $251,859,623 in the fiscal year ending June 30. Income taxes accounted for most of the increase, corporation levies netting $178,747,037 more than a year ago and individual income taxes yielding $33,698,054 more.

QUESTION: What are the names of the last ten Secretaries of State?

ANSWER:

William R. Day appointed 1898
John Hay appointed 1898
Elihu Root appointed 1905
Robert Bacon appointed 1909
Philander C. Knox appointed 1909
William J. Bryan appointed 1913
Robert Lansing appointed 1915
Bainbridge Colby appointed 1920
Charles E. Hughes appointed 1921
Frank B. Kellogg appointed 1925

QUESTION: Can you give me some facts regarding the Bunker Hill Monument?

ANSWER: This monument stands in Charlestown, Massachusetts, now a part of Boston. It marks approximately the site of the first severe engagement in the Revolution, fought June 17, 1775, with 450 American casualties in killed, wounded and prisoners and a British loss of 1,100. The British forces numbered 4,000; the American 1,800. The monument is 221 feet in height, of granite from Quincy, Massachusetts, 30 feet square at the base, tapering to 18 feet square at the top, or where the form of the apex begins. The cornerstone was laid June 17, 1825, by General Lafayette, and Daniel Webster delivered the oration. Work was begun in 1827, discontinued for lack of funds, and finally finished July 23, 1842.

QUESTION: I should like to know the date, position and by what steamer the *Great Northern* was rammed during the convoy from New York to Brest in the latter part of 1918?

ANSWER: The *Great Northern* collided with the *Brinkburn* at 2:40 a. m., October 3, 1918, in 45° 43′ N. 16° 12′ W. On October 5, 1918, the *Great Northern* collided with *LaFrance,* Brest, France.

QUESTION: What does 'E' on the smokestack of a navy ship mean?

ANSWER: In a recent issue of 'Questions and Answers' THE DEARBORN INDEPENDENT answered a question as to what the 'E' on the smokestack of a navy ship means. One of our correspondents took exception to our reply. The following information, which bears out our original statement, was furnished us by the Navy Department: 'Vessel standing one in engineering competition in its class—white 'E' on after smokestack. Vessel making 98 per cent of winner—red 'E' on after smokestack. Vessel standing one in gunnery competition in its class—white 'E' on control tower. Vessel making 95 per cent of winner—red 'E' on control tower. White 'E' on piece of armament (turret, gun or torpedo tubes) signifies that crew of that turret, gun or tube attained certain score.'

QUESTION: Are all officers and employes of the states or political subdivisions exempt from paying income tax?

ANSWER: Compensation paid to state officers and employes of a state or political subdivision, including fees received by notaries public commissioned by states and the commissions of receivers appointed by state courts, is not taxable. Employes of universities receiving salaries paid in part or in whole from funds available under the Smith-Lever Act of May 8, 1914, who are officers or employes of a state, are not required to return as taxable incomes the salaries so received.

QUESTION: Was the money repaid to Robert Morris that he lent the Government, and what was the exact amount? If the amount was not paid, could descendants of Mr. Morris claim this money?

ANSWER: The Treasury Department advises that the information on which the so-called 'Robert Morris Claim' is based is erroneous and the sum of money alleged to be in the Treasury awaiting distribution fictitious. The Congress of 1790, in which Robert Morris served as United States Senator from the State of Pennsylvania, passed an Act providing for the assumption by the Government of the United States of the debts of the Continental Congress, and if the Government owed him any money he had abundant opportunity to assert a claim, but there is no evidence in the Treasury Department tending to show that the United States was indebted to Robert Morris in any sum, nor does it appear that he ever claimed that the Government was indebted to him for moneys advanced.

QUESTION: How many miles of streets are there in Chicago and New York?

ANSWER: Total mileage of streets, paved and unpaved, in New York on January 1, 1925, was 4,145; in Chicago, 3,424.

QUESTION: In what battles of the Civil War did the Union forces have less men and win their fight? What number of men were captured and how many died in prison on each side?

ANSWER: Some of the battles in which the Federal troops were smaller in number but won: Fair Oaks, Atlanta, Pea Ridge, Mechanicsville, Malvern Hill, Corinth, Bentonville and Jonesborough. In a majority of the battles, however, the Federal troops outnumbered the Confederates. Approximately 211,000 Union men were taken prisoners, and 462,000 Confederates. Of the Union men, about 30,000 died while in prison, and 26,000 Confederate prisoners died. It is difficult to arrive at exact figures, as historians differ greatly.

QUESTION: What has been the yearly amount of profits returned from the Federal Reserve System to the United States Treasury for the privilege of issuing money since the Federal Reserve Act became a law?

ANSWER: The Federal Reserve banks do not pay anything to the United States Treasury specifically for the privilege of issuing Federal Reserve notes. Payments to the United States Treasury as a franchise tax, however, as required by the Federal Reserve Act, have been as follows:

1917	$ 1,134,234
1919	2,703,894
1920	60,724,742
1921	59,974,466
1922	10,850,605
1923	3,613,056
1924	113,646
1925	59,300

In this department we shall do our best to answer questions concerning Government and kindred matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

I READ IN THE PAPERS

Borah Rated Highly by Chinese

In the *North China Star*, the daily English-language newspaper published at Tientsin, China, Charles James Fox, the editor, has some interesting comments on Senator William E. Borah. He writes: 'Under the title, "The Senator Nobody Knows—Borah the Enigma—A Politician Who Will Not Play Politics," THE DEARBORN INDEPENDENT has an interesting and instructive article on the Senior Senator from Idaho. It says: "Yet Borah is probably better known in Europe than any other American except the President." It might with equal truth have added, "And Borah is better known in China than any other American not excepting the President."

'Ask almost any educated Chinese, young or old, to name some one in American history and his answer is almost invariably Lin Kun, which is his pronunciation of Lincoln. Ask the same man to mention a great living American and nine times out of ten his reply is Bor Ah. Stories of the life of Lincoln are to be found in all parts of China and every Chinese, who has been lucky enough to go to school, has read them in his youth. Anything about Borah has "news value," in China.'

Iowa Women Now Can Be Legislators

What is believed to be the last remaining vestige of political discrimination against women—ineligibility to sit in a state legislature—has been ended. Iowa, the only state in the Union which prohibited women from having a direct voice in the passage of state statutes, put the eligibility question up to the voters in November with the result that an amendment to the state constitution, which makes women eligible as members of the state legislature, was approved. The granting of woman suffrage by constitutional amendment six years ago in most instances automatically granted to women equal officeholding rights with men. The constitutions of only a few states needed to be changed in this respect.

'News Values' as Seen by Convicts

From a prison cell comes an editorial on crime. It appears in *The Echo*, published by the convicts in Pennsylvania's Western State Penitentiary at Pittsburgh, and it bears a message for newspaper editor and newspaper reader alike:

'Where could the young criminal find a better schooling in crime than from the front pages of the daily newspapers and the feature articles in the supplements of the Sunday papers? To speak of them as primers of crime would be mild. If one were seriously bent on compiling a handbook of crime, for use of criminals, all necessary material could be taken from our average daily newspapers.

'Let any unprejudiced person, who thinks the above is overdrawn, study the first newspaper that comes to hand, and read the headlines of the featured news. Then read the detail with which every phase of any crime is described; the methods used in committing the act; the supposed manner of escape; what the detectives have discovered in the way of clues and how they plan to catch the perpetrators. Then search for news regarding some of the worth-while things in life, some noble action, a deed of devoted self-sacrifice in the interests of mankind, any one of the things that help to make the world better and inspire emulation in the hearts of others. Do you find it on the front page, with a heading an inch high? Or is it more often found on an inside page in an inconspicuous place? What impression can the criminal mind receive when it sees crime hold the chief place in the world?'

How Two Songs Were Born

Five-year-old Patricia Conroy, says the New York *Times*, is proud of her father, Martin Conroy, and of the songs he has composed and published. She stood listening to a phonograph the other day, hearing a soft-throated tenor singing 'If I Had a Girl Like You.' Suddenly she jumped up, clapped her hands and shouted: 'That's daddy's song! That's daddy's song!'

So her 'daddy' filed a suit for $200,000 against the Jerome H. Remick Company, music publishers, for alleged piracy of a song which he had written in 1914 and which he published and copyrighted in 1921. It was entitled 'I Wonder What Makes Me Love You.'

Mr. Conroy says the Remick song, published last year, was lifted bodily from his own published and copyrighted composition. The reply of the Remick Company will be that both songs are direct and obvious steals from Johann Strauss's 'Blue Danube Waltz,' which is not copyrighted

ɤ ɤ ɤ

Is It 'Is' or Is It 'Are'?

To be *'is'* or not to be *'is'*—that is the question which still confronts high officials of the Burlington Railroad. After two months of eager searching they are still unenlightened as to when *'is'* is to be *'are,'* and when *'are'* is to be *'is.'* It all came about when a vice-president in a circular wrote: 'Along the right of way is a tremendous area in which *is* produced two-thirds of the oats and more than half the corn in the United States.'

The passenger traffic manager erased *'is,'* and substituted *'are.'* The vice-president reinserted *'is.'* Then each appealed to higher authority.

Chicago University said *'is'* is correct. Northwestern University upheld *'are.'* The dispute was carried up to Harvard. That institution approved *'is.'* A dictionary stood by *'are.'*

The vice-president wired Princeton and the traffic manager wired Yale. The answering telegrams came in together.

'Princeton prefers *"is,"'* gleefully shouted the vice-president.

'William Lyon Phelps votes *"are"* for Yale,' retorted the traffic manager. Finally they tossed a coin. *'Is'* won.

ɤ ɤ ɤ

I have no sympathy with this fashion [minimizing and blackening the fame of great men of the past]. Our great Americans who belong to the past were human, of course, but that does not prevent them from becoming great heroes and from doing great work in the liberation and upbuilding of their country. A touch of hero worship is a better quality than any amount of cheap and smart cynicism.—*Henry Van Dyke*.

Druggists Fight Indecency

Druggists of Dayton, Ohio, have taken a step toward ridding their stores of salacious and suggestive magazines, which may be widely followed throughout the country. At a meeting of their association, the following resolution was adopted and signed: 'Be it resolved, that a committee be appointed to act as censors for the magazines and periodicals sold on our stands, for the purpose of controlling the output of indecent and salacious, if not illegal, magazines that are continually placed on the market by certain publishers who have no regard for moral decency, but simply play their nefarious practice for personal gain. We are of the opinion that such publications contribute in no small degree to moral lassitude and lawlessness, detrimental to moral and physical welfare.'

BRIEFLY TOLD

THE BARN WHERE JOHN Wilkes Booth stabled his horse, and from which he fled after the assassination of President Lincoln, has recently been sold by the War Department for $4,950.

PORTABLE RADIOS WITH aerials in parasol form are a novelty in Japan.

NOTES - COMMENTS - CRITICISMS

MR. FORD'S Page this week discusses the duty of the American family to keep itself solvent.

One problem that Congress must face—and solve—during the short session is radio control. The 'air' is rapidly progressing from confusion to chaos; if something is not done soon the millions invested in radio may be seriously imperiled. That Congress realizes the seriousness of the situation is evidenced by the consideration being given to the bills now before it. (p. 1)

An American race is evolving, distinct from any other in the world. The make-up of the future citizen is not being left altogether to chance as in the past; definite elements enter in that will have important bearing on the generations as yet unborn. (p. 6)

And in thinking of Americans of the future, it is interesting to consider those of the past, the remote past. Who really did discover America? A dozen men seem to have good claims to the honor. (p. 2)

AN interesting story of the Custer Massacre, which he heard first hand from Chief Rain-in-the-Face years after the battle, is contained in a letter from a Californian:

Downey, California.

Your recent answer to the question: 'Where are the graves of General Custer's men located,' is erroneous. They are buried in the National Cemetery located on the Custer Battle Ground, seventy miles east of Billings, about halfway between Crow Agency and the station of Garryowen, on the Burlington Railway, two miles south of the railway on the ridge just above the site of the Sioux village that Custer was planning to capture, when suddenly he was surrounded by 3,000 Sioux Indians. Years after, in company with Colonel Cody and 'Curley' the Crow scout who witnessed the massacre, I listened to Chief Rain-in-the-Face tell of the battle. A powder-burned bullet hole in Custer's right temple when his body was found, suggested possible suicide, but Rain-in-the-Face stated to the contrary: 'All killed but Custer; he nothing to shoot but fight with broken sword; cry all time (spasmodic sobbing probably), no stop; I shoot him.' Old Sitting Bull then cut Custer's heart out and drank the blood. Otherwise, the body of Custer was not mutilated, he was not scalped. Every other body however had been terribly hacked and mutilated when found.

Occasionally we read of the death of 'the last survivor of the Custer Battle,' but that 'remnant' passed away some years after the fight at Fort Riley, Kansas; an old cavalry horse that the soldiers named 'Pawnee' who was found by a detachment of the 10th Cavalry, three days after the fight, saddled and bridled, stumbling around with one foreleg broken by a gun shot, the only living thing among the bodies of 473 dead men. Under other conditions, he would have been shot, but the veterinary surgeons patched him up. Every other mount and all the riders had been slaughtered, and it was generally believed that the old animal, after having escaped the slaughter of the horses and the detachment under Captain Keogh, left in the rear of the command that dismounted and advanced on foot, had after the battle was over, returned to the scene and was *hunting for his rider*, who had probably often fed him a little sugar from his hand. The boys of the 10th so construed it, saved him from execution and returned him to the 7th that nursed him until he, 'the real Last Survivor' passed away. 'Curley,' the Crow scout, coming from Major North with dispatches to Custer, reached about one mile from the battle-field and kept concealed during the action, made his way back to North, knelt down and sticking a lot of twigs in the sand 'swiped' them away with his hand saying: 'Custer, all gone!'

Now on the battle-ground, the spot where each dead soldier was found is marked by a permanent white stone. They are clustered thickly around the cross that marks the fall of Custer, and from there, a 'trail' extends back over one mile; clusters of three and four, and occasionally two, that mark the spot where 'buddies' stood back to back, and died. The last distant stone stands solitary and alone, telling where he who was then probably *the last survivor* was overtaken.

C. P. PHILBRICK.

'HAVE you ever tried to keep a hard-worked, healthy man happy on food costing little more than ten cents a meal?'—The question comes from an army officer on the Pacific Coast. His name is omitted because his personal point of view conflicts with the Government's official economy program:

Fort McArthur,
San Pedro, California.

I was very much interested in your editorial, 'In Line of Duty'—and particularly the last paragraph thereof—which appeared in your issue of November 27.

As this post is situated nearest the heart of the movie industry, let me tell you of our predicament. Although this is one of the most important harbors for the United States Fleet, and consequently its defense is of similar importance, we are carrying on with less than 200 officers and men. Consequently, most of the armament is out of service—although we try to keep it in first-class condition and to do all of the other duties and exercises so necessary to keep soldiers in readiness for war. It would be obvious, then, that everyone works.

The Government allows from thirty to thirty-five cents a day on which to feed a soldier, and a large part of the food is bought by individual purchases from local stores, not through the Quartermaster. We pay about the same price as everyone else. The ration allowance for November is 33.35 cents per day. Have you ever tried to keep a hard-worked, healthy man happy on food costing little more than ten cents a meal?

The officers over these men are held responsible that they are contented, for a discontented army breeds trouble. Consequently, every available cent that can be scraped up to add to the mess fund is eagerly grasped.

Where can we get it? Not from the Government. We cannot get it by charging admission to athletic affairs, for that is forbidden. We cannot tax the men, for a buck private at $21 has little enough after he has paid for having his uniform altered or pressed, his laundry, toilet articles, hair-cuts and a few movies.

The only place where we can get it is from the profits of the Post Exchange—an indirect tax on the officers and men and by *gifts* from civilians. So far as this small post is concerned, our income from the Post Exchange, which operates in competition with the stores in the surrounding city, is not very great. The *gifts from civilians* come almost entirely from the local motion picture producers in return for our services *given only when it does not interfere with our training.*

This money goes into the regimental and battery funds and enables us to provide food of sufficient quantity and quality to keep the men satisfied, to purchase athletic equipment and to obtain many another little item for which the Government makes no provision—but expects us to have.

So, until such time as some good American can induce the Government to feed the army decently 'the practice of lending American soldiers' and 'subverting their dignity' will be gladly indulged in as the best available means of obtaining that which every ordinary human most desires—decent food.

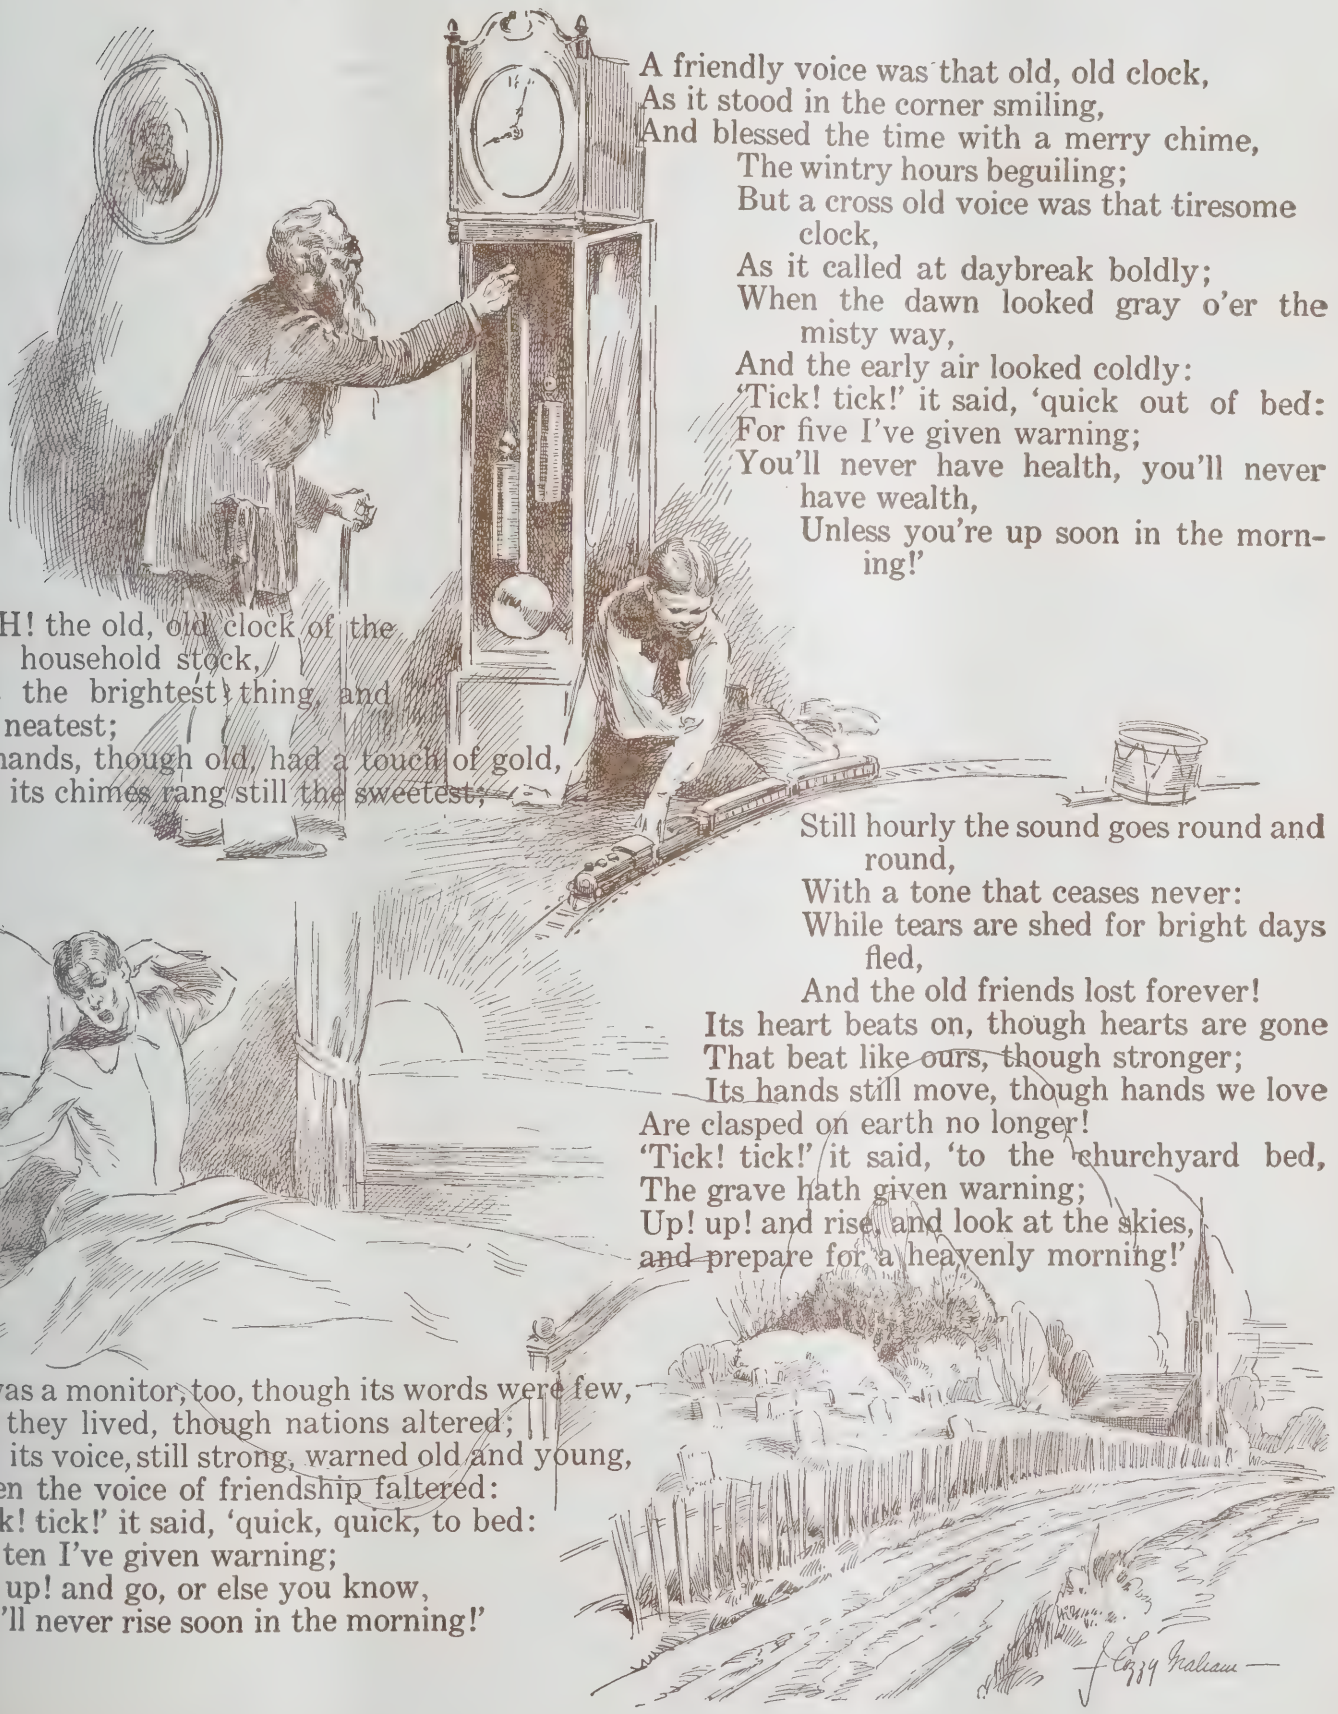
GAIUS GLENN ATKINS, pastor of the First Congregational Church of Detroit, has traveled extensively abroad, and has a wide acquaintanceship among noted Europeans. (p. 24)

The Old House Clock

from McGuffey's Fifth Eclectic Reader, Series of 1879



OH! the old, old clock of the household stock,
Was the brightest thing, and neatest;
Its hands, though old, had a touch of gold,
And its chimes rang still the sweetest;

'T was a monitor, too, though its words were few,
Yet they lived, though nations altered;
And its voice, still strong, warned old and young,
When the voice of friendship faltered:
'Tick! tick!' it said, 'quick, quick, to bed:
For ten I've given warning;
Up! up! and go, or else you know,
You'll never rise soon in the morning!'

A friendly voice was that old, old clock,
As it stood in the corner smiling,
And blessed the time with a merry chime,
The wintry hours beguiling;
But a cross old voice was that tiresome clock,
As it called at daybreak boldly;
When the dawn looked gray o'er the misty way,
And the early air looked coldly:
'Tick! tick!' it said, 'quick out of bed:
For five I've given warning;
You'll never have health, you'll never have wealth,
Unless you're up soon in the morning!'

Still hourly the sound goes round and round,
With a tone that ceases never:
While tears are shed for bright days fled,
And the old friends lost forever!
Its heart beats on, though hearts are gone
That beat like ours, though stronger;
Its hands still move, though hands we love
Are clasped on earth no longer!
'Tick! tick!' it said, 'to the churchyard bed,
The grave hath given warning;
Up! up! and rise, and look at the skies,
And prepare for a heavenly morning!'

BUT Christmas is not only the mile-mark of another year, moving us to thoughts of self-examination,—it is a season, from all its associations, whether domestic or religious, suggesting thoughts of joy. A man dissatisfied with his endeavors is a man tempted to sadness. And in the midst of winter, when his life runs lowest and he is reminded of the empty chairs of his beloved, it is well that he should be condemned to this fashion of the smiling face.

'NO, THANKS. BUSY!'

Safer Driving for Everybody

Talk to the women who drive their own cars today and see how many of them are depending on the safety features of Firestone Gum-Dipped Balloons! For Firestone engineers have designed and built these big tires—with full appreciation of their responsibility for the safety and comfort of that big army of women and children who use the motor car.

With Firestone Balloons there is no skidding, slipping or sliding. The tread is broad and scientifically designed to hold the road—on oily boulevard, slushy highway or frozen, rutted places. In a pinch of traffic or parking—for quick starts and stops—it is a joy to feel the control of wheel and brake which these tires give. The children and you will delight in the way the tread seems to iron out the road beneath you, giving freedom from jolt or jar.

The Firestone process of Gum-Dipping adds so much strength and flexibility to these tires that you get much more mileage and are relieved of annoying tire-troubles. To get full benefit in the healthful daily spin go safe and care-free on Gum-Dipped Balloons!

The Firestone Dealer will not only see that you have these better tires but he will give you better service. Ask him to call and explain details.

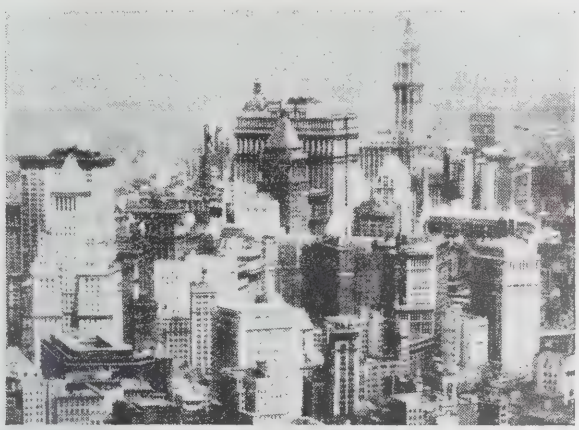
It Has Forced Many Bankers *to 'Carry'* Great Properties *Whose* Securities *They Sold to the* Trusting Public

By CHARLES ALBERT COLLMAN

THE telephone sounded on the desk of the realty expert who has the reputation of owing as much as, if not re than, any man in the ntry on the complex and putable subject of build- and land values. As an icial of a corporation that s loans of close upon one lion dollars on real estate the United States and nada, he has devoted two ades exclusively to the dy of such values. The lty man began speaking his friend at the other end the wire. He spoke em- atically; he tried to im- ss his hearer. 'Don't you it,' he said. 'Take my vice. If you were twenty rs younger, perhaps I ght say "Go ahead—take hance." But you've got the money you want. I h I had as much. Why n't you go to Europe, or p on playing golf? Yes, I know the property, but t section is overbuilt; l that's why I'm telling u that if you go into this ing now, you'll only rten your life.'

The dialog ended un- isfactorily, and the speak- turned to me and re- rked: 'That man has a lion dollars on which he getting eight per cent erest—$80,000 a year. e money burns in his ds.

'He wants to put it into big building project. You heard at I told him; but'—and he shrugged shoulders—'I know he won't listen my words. It is quite useless.'



—Brown Brothers Photo.

Part of Lower Manhattan.

THE astonishing building boom that has swept the country in the past six years has beautified the streets, avenues and landscapes of hundreds of American cities; magnificent hotels rear their proud facades; theaters of a capacity heretofore unknown have opened their portals; industrial buildings, twenty-five to thirty stories and more, in the pyramid style of modern architecture, lift their towers in thoroughfares which previously were lined with dismal tenements or grimy lofts; the states are punctuated with new suburban developments, dotted with English country houses, Colonial homes and Elizabethan manors, and sandy stretches of seashore, sound and lakeside have been converted into bungalow colonies clustering about golf courses and country clubs.

But as in all large public movements that are influenced by mass psychology, where much has been well and even splendidly done, indiscreet enthusiasm often leads to over-accomplishment, and this to disaster.

It is true that countless fortunes have been made in speculative buildings and development projects, but it also cannot be denied that in them fortunes have been embarrassed and even lost. Legitimate undertakings, backed with ample capital and with wise forethought, are garnering and will continue to garner the reward of their efforts, and securities issued against them in the shape of bonds, whose issues are prudently designed and guaranteed by strong surpluses, are sound.

Opinions on this subject have been sounded frequently since the early part of last year; their sponsors are divided into two groups. Realty and investment authorities have been trying to warn builders, property owners and mortgage-bond investors against the perils of overbuilding.

They have pointed out that one-eighth of the national income was expended in 1925 in construction. They maintain that many of the very largest buildings, hotels, apartment houses and lofts are already unnecessary; that while they may readily be filled with tenants, yet these will be drawn from structures somewhat older, but still available in every modern sense. They insist that bond houses put up many buildings in their anxiety to continue selling first-mortgage bonds to the public; that speculative builders, borrowing to the full the cost of construction, disregarding the income-bearing possibilities of the buildings they sponsor, sell them out at a profit, only to put the proceeds from their sales into fresh ventures; that even banks and financial institu-

tions rear monumental piles to perpetuate their names, and fill them with tenants by offering inducements that amount sometimes practically to free rentals. They say that they do not wish to place a check upon enterprise or expansion, but that a continuance of the above-named practices will involve unpleasant consequences.

—Brown Brothers Photo.
Where a sense of balance is essential.

The second group, composed of builders, or rather of bankers who finance building enterprises and market their securities, vigorously dispute the contentions of the realty authorities. And their reasoning is quite effective, if not to say convincing to many persons. The banker-builders maintain that the old and conservative methods of real-estate financing, based on European tradition, no longer meet the demands of the day; that modern enterprise and the abundance of liquid capital justify the adoption of newer and bolder principles of financing construction.

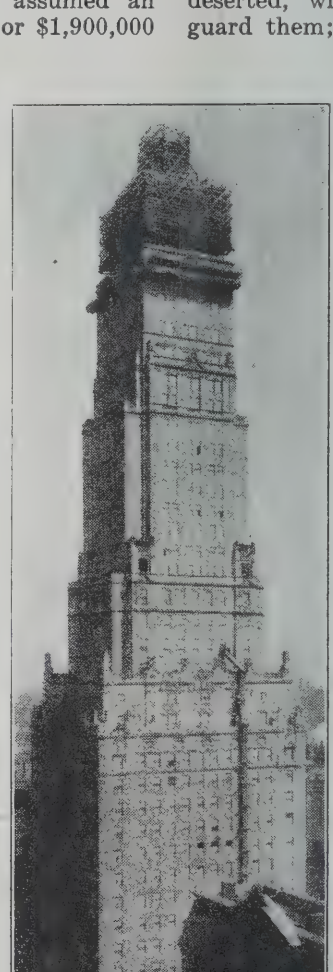
They argue that many of the proudest buildings that now grace the cities of the United States would not have come into being had they not been backed by the monetary support afforded by the newer system of finance. And they illustrate their argument with two facts: first, that their flotation of bond issues on new buildings has been uniformly successful, and second, that clients who have invested in such securities have never lost either principal or interest.

By the very intricacy of such arguments, the average person is confused. Time alone can be the great arbiter of the dispute. Results count, and the situation as it exists today is rather remarkable, even amazing, but as yet by no means tragic. Examples will be given of the actual condition of certain enterprises which loomed largely and brilliantly in the building boom of the last few years.

A few years ago a man from California headed east and broached to his friend, an investment banker, in one of the largest cities on the Atlantic seaboard, his ideas of organizing a hotel enterprise. He schemed to build a caravansary unexampled in that city—one which would be the last word in exclusiveness and elegance, and situated, quite naturally, in an ultrafashionable neighborhood. The banker listened and became convinced that the plan had merit; he agreed to raise money for the project from the public. His banking house had a country-wide prestige, and he never stinted his advertising bills. He succeeded in selling $6,500,000 in securities on this hotel proposition to investors who were eager to place their money safely in the best security of which they knew—that is, first-mortgage real-estate bonds.

Now the land on which the hotel stood had cost $1,000,000, and the building itself, outfitted with all improvements and innovations imaginable, cost an additional $3,600,000. Thus the property, which had cost the sum of $4,600,000, had assumed an obligation of $6,500,000, or $1,900,000 more than its builders had expended upon it. It is true that an additional security had been placed under the mortgage, namely the hotel furnishings, which were lavish but perishable.

Some time later the hotel promoter and the banker fell out; something happened to produce a rift in their relations, and the banker, whose boast was that investors in securities issued by his house should never lose a penny, 'took over' the hotel. That is to say, the banking house itself, which had underwritten and marketed the bonds, placed in charge of the property its own manager, and today conducts the hotel as part of its institutional enterprise. In other words, the banking house went into the hotel business as a side line, assuming the risks of the enterprise. The hotel is said to be prospering, and no objections have been raised to this arrangement; the bondholders have no cause for complaint.



Ritz Tower, New York.

In another eastern city, a simi enterprise was financed by a differe bond and mortgage house. This hot with its interior decorations, its furni ings and its cuisine, is in truth beautiful and attractive place, and great popularity with national a international visitors who make their headquarters. But like ma things beautiful and expensive, financial returns were such that bankers who sold its bonds have a 'taken over' the property, and running it today. These financiers th have also gone into the business hotel management.

In one of New York City's choic residential districts, overlooking sweep of the Hudson River, th stands today a tragic reminder of uncertainties attending the financ of real-estate ventures. An impos building rises to a height of twe stories, the upper ones being in tower formation now required by bui ing authorities, that light and air m not be shut out from neighbor structures.

For two years the majestic has reared its walls, abandoned a deserted, with only a watchman guard them; its hundreds of windo stand agape; bel them, wooden brid still cover the si walks to protect destrians from t dangers of t falling building ma rial; but the bu workmen are abs from the buildin still unfinished in rior. A group of p sicians had planned erect here a hospi apartment hou where wealthy in lids could live wh receiving medical tendance.

The enterprise v novel, and perha somewhat ventu some from the sta point of success, finally a bond ho was found willing finance the sche The walls were up, but before building could be co pleted financi troubles interven For two years the completed struct has stood vacant, a according to rep during that peri several of its found have suffered crush losses; one man is s to have dropped

Vicente Ibanez at his villa at Mentone, France. —*Herbert Photo.*

Vicente Blasco Ibañez

DON QUIXOTE *of the Twentieth Century*

By HENRY ALBERT PHILLIPS

THERE is not a little about the Spanish patriot and revolutionary, Vicente Blasco Ibañez, in his lonely exile, that resembles his famous fictional compatriot, Don Quixote, and his battle against the windmills. Don Quixote, too, was a reformer, if you will recall, fighting against the obsolete tyranny of feudalism and chivalry. He was a singular, sad figure who fought all his battles alone, being deserted even by his otherwise faithful Sancho Panza. He and his ideas were received and combated as a visionary and each encounter seemed to result in utter defeat, leaving him grievously wounded in soul and body. Yet in the end this fictitious Knight of the Sorrowful Countenance did more than any other to break up the barbarism that he attacked.

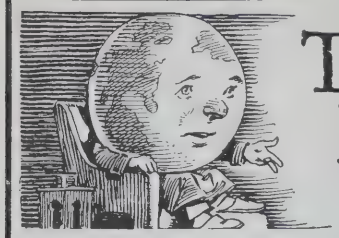
In his native Spain, Ibañez, too, is regarded—by his political opponents at least—as a visionary. His battles thus far have been seemingly as ineffectual as Don Quixote's encounters with windmills and have resulted in the main by his being clapped into jail, spending not days but years at the hands of the people whom he was trying to save. Finally, it has resulted in his expulsion from his native land under a threat of imprisonment and death should he ever return.

UNDAUNTED, however, he continues to propagandize revolution in Spain from his retreat in the French Riviera. It is said that he is in constant danger of assassination from spies that surround his villa; that he maintains a life guard and goes about armed to the teeth.

Don Quixote had his other side; he was one of the most comic figures in all literature. Ibañez shares this comic side with Quixote; there are moments when the revolution takes on a South American aspect. Ibañez, too, has the most doleful of countenances. (You have seen the kind of people I mean, who are so glum that they make you smile?) But it is no laughing matter for them, heaven knows!

Ibañez's retreat is in the village—or just out of it—of Mentone, the frontier town of the French Riviera on the way to Italy. From the observation terrace of Villa Fontana Rosa, as Ibañez calls his place, you can see the curving shores of Italy only a few miles away. But Ibañez may never set his foot upon them, because Mussolini is opposed to all revolutionists and will not grant them passport visas. And Ibañez told me he pined for Italy!

I arrived in Mentone from Monte Carlo one warm Riviera winter's morning. I took a tiny tram down in the market place with the usual first and second class places divided by the hair-line distinction of having a carpet nailed over the board seats. All the way out to Garavan, the section where I knew Ibañez lived, I saw signs: 'Villa Fontana Rosa,' with an arrow indicating the direction. I had idly thought it advertised a hotel, or some public place. When I alighted from the tram I was informed that the Villa Fontana Rosa was the residence of Ibañez. One could not possibly miss the way. This was (*Continued on page 21*)



The World Tells Its Tale of 1926

BY HARRY PENCE

AS THE year 1925 drew to a close many important events transpired which had direct bearing on the new year.

Congress convened and the House promptly passed a bill reducing federal income taxes. Turkey refused to accept the League of Nation's award in the Mosul controversy. The Irish Free State and Ulster settled their border dispute. As had been anticipated, an army court-martial convicted Colonel William Mitchell of insubordination and suspended him from his rank, duties and pay for five years. He resigned from the service. General Smedley D. Butler left Philadelphia amid a blaze of charges and countercharges.

On the very last day of 1925 Crown Prince Carol renounced his right of succession to the throne of Rumania.

Jan.

The new year found Germany in quest of a chancellor who could form a coalition cabinet and France in eager search for a minister of finance who could balance the national budget. The German Reichstag wrangled until President von Hindenburg dropped distinct hints of a dictatorship, which brought about the approval of Hans Luther's cabinet on January 19. In Latin America civil war had again broken out in Nicaragua, from the capital of which American marines had been withdrawn in August, 1925, after 13 years of occupation. The Tacna-Arica controversy between Chile and Peru became daily less amenable to settlement.

In this country the courts made considerable progress in January. On January 2, the United States Circuit Court of Appeals confirmed the conviction of Charles R. Forbes, former director of the Veterans' Bureau, and John W. Thompson, a favored contractor, for defrauding the Government and disabled soldiers and on January 11, the United States Supreme Court refused to review the conviction of Congressman John W. Langley, of Kentucky, for violation of the federal liquor laws. Langley promptly began serving his sentence. Thompson died on May 3. Forbes entered prison at Leavenworth on March 20. Langley did not resign his seat in Congress until the Supreme Court took final action in his case and when he did so his wife became a candidate for the vacancy. She lost in her first effort but in the regular primary in August she was nominated and was elected in November.

Another court decree of far-reaching consequence was the affirmation by the Federal Court of Appeals of the cancellation of Elk Hills oil land lease to the company headed by E. L. Doheny. In Hungary on January 5 a gigantic counterfeiting conspiracy was unearthed. Prince Ludwig Windisch Graetz had undertaken to finance a royalist coup with bogus French francs, for which misdeed he and his associates are now serving prison sentences.

On January 4, Secretary of the Treasury Mellon appeared before a committee of the House of Representatives and explained that the war debt settlements negotiated with foreign nations were equitable and generous without sacrifice of American interests. Later in the year he told a somewhat different story, but in the meantime the pacts had been ratified, the House approving those with Belgium, Czecho-Slovakia, Esthonia and Latvia on January 16.

After a stubborn fight in which a cloture was invoked the Senate, on January 27, voted for the adherence of the United States to the Permanent Court of International Justice (World Court), with reservations. On January 25, the United States Liner, *President Roosevelt*, went to the aid of the British freighter, *Antinoe*, and standing by for four days took off the crew of twenty-five men at imminent peril to the rescuers. For this Captain George Fried and his crew were decorated by King George and were accorded a rousing reception on their return to New York on February 16.

Feb.

During this month the Senate took up the House tax reduction bill and, aside from repealing the publicity clause, added reduction to reduction until Administration and House loudly protested. This bill, the Revenue Act of 1926, was passed by the Senate on February 12, and was sent to conference. Most of the Senate amendments survived. The conference report providing for reductions of approximately $387,000,000 was accepted by the House on February 23, by the Senate of the following day and was signed by the President February 26. Instead of the promised deficit the Treasury now reports a surplus.

Mar.

In March the French Chamber of Deputies defeated Premier Briand's finance bill and he resigned his eighth premiership, only to reorganize his cabinet and undertake the job for the ninth time. A newspaper 'straw vote' on modification of the Volstead Law showed a 'wet' majority in 'wet' districts. The Tacna-Arica situation became more confused by the demands of Peruvians for protection during the registrations for the forthcoming plebiscite.

In the year 1925 undoubtedly the most

memorable event was the negotiation of the Locarno pact in which France and Germany gave mutual pledges to maintain peace on the basis to the status quo, with England, Italy and Belgium as guardians of the principals and guarantors of their good faith. According to this agreement, after its ratification Germany was to be admitted to the League of Nations with a permanent seat in the League Council. The League was called into special session at Geneva on March 8. France wanted Poland also to have a permanent seat in the council; Spain and Brazil both wanted seats on their own account. Japan objected to the whole proceedings for reasons of her own. Germany refused to compromise and on March 17 it was agreed to let the matter go over till the regular meeting of the assembly in September.

This month marked the first of a number of attacks upon the life of the Italian dictator, Benito Mussolini. On April 7, Violet Gibson, an English woman supposed to be mildly demented, shot at him and inflicted a slight wound on his nose.

On April 12 the Senate ousted Smith W. Brookhart, of Iowa, seating a Democrat in his place. It was poor strategy, for he forthwith entered the primaries against Senator A. B. Cummins, loyal administration man, and defeated him for the nomination. Senator Cummins was 76 years of age at the time, and he died on July 30. On the day after the Iowa primaries Frank L. Smith won the Republican nomination for United States Senator from Illinois defeating Senator W. B. McKinley. In the wake of this election and the primaries in Pennsylvania, came a senatorial investigation into the extravagant use of money by various candidates.

General Pangalos was inaugurated as president of Greece on April 18.

The Senate ratified the war debt pact with Italy on April 21. An apostolic letter from Pope Pius XI to the bishops of Mexico, on April 19, clearly foreshadowed trouble which materialized before the year was much older.

On April 27 the most spectacular of a long series of murders in the Chicago crime war zone took place in the village of Cicero, in which William McSwiggin, assistant district attorney of Cook County, was among those slain in a machine-gun barrage. Investigations which followed got nowhere.

After long negotiations the British coal miners and mine owners failed to agree on terms, and continuance of the industry. In 1925 an impasse had been averted by a government bounty, but the time allowed for settlement of the differences passed without effective action. The miners went out on strike May 3 and union leaders called a general strike which paralyzed industry in the British Isles until it was called off, May 12. The coal strike became a struggle of attrition, the men drifting back gradually until, on November 13, the Miners' Federation gave up the fight and advised the miners to accept a compromise which was little less than complete surrender.

In May the North Pole was twice visited. On May 9 Lieutenant Commander R. E. Byrd, United States Navy, circled the Pole in a plane, setting out from and returning to Spitzbergen. Two days later Roald Amundsen, discoverer of the South Pole, with Lincoln Ellsworth, American, left Spitzbergen in the Italian dirigible, *Norge*, crossing the Pole May 12, and landed at Teller, Alaska.

On the day Amundsen passed over the Pole, Marshal Pilsudski, former premier of Poland, advanced on Warsaw with his army. President Wojoischowski and his associates fled, the city fell into the hands of the invaders, many were killed in the advance, but by the end of the month a semblance of order was restored with Pilsudski declining office but directing affairs from the background.

On May 6 Harry M. Daugherty, former Attorney-General of the United States, Thomas H. Miller, former Alien Property Custodian, and John T. King, once Republican national committeeman for Connecticut, were indicted for fraud against the Government in the return of sequestered property to the American Metals Company, a German firm, the specific charge in the case of Daugherty and Miller being denying the Government their faithful and unbiased services. King died a week after the indictment. The trial began September 6. On October 11 the jury disagreed. The case, called for retrial, has been set for a date early in January.

The next to the last day in May Abd-el-Krim, the turbulent chieftain of the Riff in Morocco, who practically drove the Spanish out of the hills and caused the French heavy losses at a time they couldn't afford it, surrendered. With his eight wives he was transported to Reunion Island in the Indian Ocean in August. On May 27 Crown Prince Gustavus Adolphus, of Sweden, and his wife, Princess Louise, arrived in New York, spent several weeks in America, and departed for the Orient. The Sesquicentennial Exposition at Philadelphia opened its gates May 31.

When William S. Vare, Congressman and political boss of Philadelphia, defeated Senator George W. Pepper and Governor Gifford Pinchot for the nomination in May, there was some surprise. This gave place to amazement, when a Senate committee, investigating charges of misuse of money in the campaign, discovered in June that the three candidates spent $2,793,587.02. After the adjournment of Congress in July the committee, headed by Senator James A. Reed, of Missouri, went to Chicago and found a similar condition. On June 15 the effort to settle the Tacna-Arica controversy by means of the plebiscite prescribed by President Coolidge practically collapsed. Chile announced intent to re-

(Continued on page 24)

How the STORMS That Rage on the SUN Affect the EARTH

By
PROFESSOR F. R. MOULTON
As Told to
J. V. NASH

Professor Moulton.

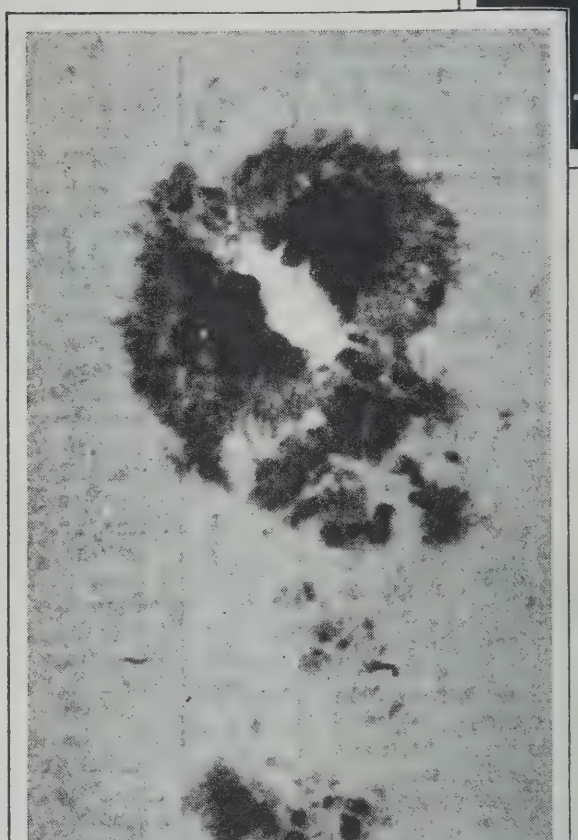
To the observer on the earth, the sun seems to pursue its placid way across the heavens, day after day, with no disturbances visible on its radiant face. But the astronomer, looking through his telescope, gets a view of solar storms of a scope and intensity compared with which the recent Florida hurricane was less than a light summer zephyr rippling the surface of a small pond.

Sun storms, with the accompanying phenomenon of sun spots, are not merely of academic interest. Nothing could be of more vital practical concern to human beings than a serious disorganizing of the sun, for it is upon the light and heat radiated from the sun, and the continuance of that radiation without marked fluctuation, that the existence of all life upon the earth depends. Then, too, the sun, as the dominating member of our solar system, governs the motions of all the planets, including our earth.

The amount of solar energy which is thrown into space by the sun is so immense as to be far beyond ordinary comprehension. It has been calculated that the energy radiated per square yard from the sun's surface is equivalent to 70,000 horse power. This represents an amount of heat energy which would melt a layer of ice 2,200 feet thick every hour all over the surface of the sun; it would melt a globe of ice as large as the earth in two hours and forty minutes.

The rate at which radiant energy of all wave lengths is received by the earth from the sun at the outer surface of the earth's atmosphere when the sun is at its mean distance is, in terms of mechanical work, 1.51 horse power per square yard, and the rate at which solar energy is intercepted by the whole earth is, in round numbers, 230 trillion horse power. Three hundred horse power are received on a building 50x150 feet. From another point of view, the earth is receiving energy from the sun at the rate of 160 horse power per inhabitant of the world. Yet less than one two-billionth of the energy poured forth by the sun is intercepted by the earth.

The rate of radiation from the sun



—All Photos Courtesy Yerkes Observatory.
The great sun spot of July, 1905.

Sun storm. This jet-like prominence is shooting out from the sun's edge 124,200 miles.

sometimes varies in a few da by as much as 10 per cent. this change were to persist for long period, it would have serious effect upon the temper ture of the earth.

Few, perhaps, realize that t sun is the cause of all the stor that arise on the earth. The s warms the air over the equa rial regions of the earth more th that over the higher latitud and the resulting currents th are set up produce our win Wind has been an importa source of energy utilized by m and all of that energy came fr the sun.

Again, all the water pow on the earth has been created the sun. The sun's heat eva rates the water of the ocean a raises it into the air a half-m or more, the winds carry a p of this water out over the la where it falls as rain or sno and in descending again to t ocean it plunges over precipices falls at steep grades, and ener is released.

The amount of work that t sun does in raising water wh falls again as rain may be realiz when it is pointed out that in t eastern half of the United Stat where the annual rainfall about thirty-five inches, 2,000,000 t of water fall on each square mile fr a height of half a mile or more.

Thus, too, coal—upon which civ ization is largely dependent for t maintenance of the great industr processes—is a child of the sun. was formed from plants which ages flourished on the earth. In millions tiny cells the sun's energy broke up carbon dioxide, which they inha from the atmosphere; then the oxy was exhaled, and the carbon was sto up in their tissues. When coal is burn the energy which the sun origina

ut into the plant is given up again. he energy derived from petroleum—e other great source of modern echanical power—has a similar hisry.

In short, all the important varieties energy used by man can be traced ack to the sun.

The source of the sun's heat is robably in the subatomic energies of e mass of which it is composed, and s radiation is probably in some way the expense of its mass. Nevertheless, it seems probable from several es of evidence that the sun will ntinue to illuminate and heat the rth at approximately the present te for hundreds of millions of years in e future, as it has done for corresnding ages in the past.

The titanic storms which rage on e surface of the sun are perhaps the ost extraordinary and fascinating of l the celestial phenomena observed r man. They occur with greater tensity and frequency about every even years. Why this is so, we do not yet know. The period varies by a few years, and the maxima are not always equally marked.

To understand the olence of solar activity it is necessary to get a idea of the magnitude ad the temperature of te sun. The diameter of te sun is about 866,000 rles. This number is so st that it does not cry to the ordinary ividual any very prece conception.

A good way to illustrate the great size of the sn is to imagine the erth placed at its center ad the moon revolving ound it as at present. Under these conditions, we should find that the moon's orbit is not only wholly within the sun, but hardly more than halfway from the sun's center. Another way to express the size of the sun is that it is more than a million times greater than the earth in volume. If an observer could look at the earth from the sun, our world would appear as a tiny speck, as small as Mars appears from the earth.

The high temperature of the sun is more astonishing than its great size. Even at the surface, from which heat is radiated into space, the temperature is about 10,000 degrees Fahrenheit—about twice the highest temperature that we can maintain by artificial means.

Since all known substances are not only melted but vaporized long before we reach this high temperature, it follows that the sun is not solid nor liquid, but in a gaseous state. The temperature of the sun increases rapidly with distance below its surface. There is reason to believe that long before the center of the sun is reached, the temperature is more than a million degrees Fahrenheit.

The great temperature of the sun causes it to radiate light and heat at the enormous rate just mentioned.

Since this heat must be supplied from below by convection and radiation, violent circulations of the sun's materials are induced, and the consequence is the storms of unimaginable violence which are frequently observed upon its surface.

The solar storms range in diameter from the limits of visibility up to great disturbances more than a hundred thousand miles across. In these storms huge masses of vaporous heated materials, sometimes hundreds of times larger than our earth, are driven hither and thither with a speed reaching into hundreds of miles a minute. They are sometimes thrown aloft to heights above the sun's surface twice as great as the distance from the earth to the moon. In other words, some of these tongues of flaming gaseous material are thrown out beyond the surface of the sun for a distance of half a million miles. It is fortunate, indeed, for our earth that it is situated some 93,000,000 miles from the sun. If it were lashed by one of these immense arms of solar flame life would be annihilated.

The largest of these disturbances on the sun are on such a great scale that they can be seen with the unaided eye, through a smoked glass or the dense atmosphere near sunrise or sunset. Such storms have appeared several times in the last year or two, the most recent being in September of this year. Although they are occasionally visible with the unaided eye, they seem not to have been noted by the ancients.

(Concluded on page 25)

Notable display of sun spots, photographed on October 13, 1926.

A number of storms are displayed around the circumference in this photo of the complete solar disc.

The Penalties of PUNCTUALITY

By LADY CYNTHIA ASQUITH

Drawings by RICHARD BROECKER

Trains and tides will not pander to the unpunctual.

SOME virtues are not always their own reward. Far from it!

For instance, though your punctuality is certainly a convenience to your fellow creatures, to yourself is it not often heavily penalized?

'Be punctual and you shall be kept waiting' would be far truer than is 'Knock and it shall be opened unto you.'

Oh! for a magic wand which could restore, for further use, all those hours which one has spent in waiting for others. Such a gift would be nearly as welcome as another favorite dream of mine—the receipt of a parcel containing all the things I have ever lost.

To be incurably punctual—a slave to the clock—incapable of adapting yourself to the lateness of companions, is indeed a misfortune.

You will waste time waiting everywhere—even at the altar!

To sit jigging in a taxi till your hair comes down while you wait to start out for dinner—dread of your hostess rising with the fare—is bad enough. Such is the recurring discomfort of the punctual wife of an unpunctual husband. Even worse was her fate in the early days of motoring when she dressed for a drive quite as deliberately as a diver dresses for a descent. According to the prevailing fashion, her hat was then teed up to the top of her head to the hair of which it was skewered by numerous painful pins. Gagged, blinded and stifled by veils, with goggles squashing her eyelashes, she gasped in the hall, impatiently awaiting the fortunate unpunctual. There are of course exceptions: trains and tides will not pander to the unpunctual; but on the whole, with what injustice does habitual tardiness escape any punishment! How seldom are the unpunctual themselves inconvenienced!

Take a dinner party. Who suffers? Not the last-comer who, arriving half an hour late, goes straight in to dinner—unless indeed he be shy, and surely no natural shyness could survive a long career of unpunctuality. No, the victir is the punctual guest, precipitated int a hostess-less room, there to b 'discovered' by unintroduced an abashed fellow guests.

True, the culprit's soup is congealec but then, so is everyone else's. In th case communal punishment prevails.

Another injustice lies in the fa that each individual establishes th standard by which he is judged. you have earned a reputation f punctuality, unerring exactitude will b expected of you, and a solitary laps on your part will never be forgive On the other hand the proverbial u punctuality of your friend is accepte with good-natured fatalism.

'Dear C. is a ways late,' says th hostess with an i dulgent smile. Pun tuality is no more e pected from C. tha agility is expect from a cripple.

I'm sure there a special wrinkles whi are delved by wa ing for others. 'Wa ing wrinkles' a probably just as de as those wrought l laughter and l worry.

If the theory f reincarnation be tru those who are u punctual in one e istence will be creat punctual in their ne Thus and thus or will they receive te punishment which s their due.

Such is the recurring discomfort of the punctual wife of an unpunctual husband.

MR. FORD'S PAGE

OF THE DEARBORN INDEPENDENT

IF TRUE education turned men into dictionaries, or catalogs of guesses which men call philosophy, or even into trained brain police for the protection of a wholly wrong political economy, the world would be justified in abolishing it.

Such education, accomplishing such injurious results, would be considered worse than a hoax; it would be called a crime against mankind. Instead of fitting men for life, it would be considered worse than leaving them in their natural state, for such a system would be a systematic unfitting of men for life.

Yet these things are being done, and in the name of education; but thoughtful minds have always refused to believe that it was true education.

What they want to abolish, therefore, is not education, but false education; and the method of abolition which they approve is that of substituting the true for the false.

There is a great need of clear definition and of clear objectives in this matter of education. For example, we need to realize afresh that education is not something put into a man, but something drawn out or developed. A thoroughly schooled man is not necessarily, indeed all too seldom is, an educated man. He knows who wrote this or that, but he does not know how to grow his food. He can read but he cannot reap. He can parse verbs but he cannot plow. He is schooled, but in all the things by which he must live he is practically a greenhorn. He knows how to read but he cannot *know* most of the things he reads, because the only way of learning is by doing.

> *EDUCATION can only make a man at home in his world, that is, it can make him self-sustaining from the ground up. Most education ignores the physical basis of life. We rear increasingly large generations in the expectation of having others earn their living for them; we teach them to inhabit a paper world, to assume that ink is preferable to action. We have considered the Brain as the organ to be trained, and we have neglected the other and most important implement of the mind, the Hand. One trouble with the world is too much brain-work without the normalizing balance of hand-work.*

He is called an educated man; he is supposed to have been trained to fill a productive place in the world; yet when he goes upon the sea, every illiterate sailor lad is his superior; when he goes into the forest, the untaught Indian or guide is a learned sage in comparison; when he goes upon a farm, the tiller of the soil dwarfs him with his wide range of knowledge concerning heaven and the three kingdoms of earth; when he goes into industry he finds himself ignorant of the oldest knowledge of mankind; his education has turned him loose with everything yet to learn, and, in too many cases, lacking the knowledge *how to learn.*

Worse than that, he is misled into misjudging unbookish men as uneducated. It is Dr. George A. Gordon of the Old South Church, Boston, Harvard man, scholar and thinker, who says:

'When I was a boy on the farm . . . there were no scales on which to weigh the oxen that we intended to sell. How could we ascertain their value? . . . We measured the oxen; we put a line down the whole length of the animal's back, and then took his girth, and, taking the length and the girth as premises, from these figured out the weight and the value of the animal. That farmer had a very great influence on me. I remember to this day his formula, "Measure with exactness, calculate with caution, and in that way you will reach something like a sound conclusion." And again, "Look out for your premises, and then look out for your processes, and when you do that, you can be fairly sure of your conclusion." That farmer was an educated man.'

A paragraph like that answers the question, what is the object of education? Education can only make a man at home in his world. Which means, make him self-sustaining from the ground up. Most education ignores the physical basis of life. We rear increasingly large generations in the expectation of having others earn their living for them, while they themselves keep books on the exertions of the earners or write volumes on the social questions involved. We teach them to inhabit a paper world; we teach them to assume that ink is preferable to action.

We have considered the *brain* as the organ to be trained, and doubtless that is right. But no one has ever directly trained the *brain*, it is invisible and beyond manipulation. What we do is to train those protrusions or outer tentacles of the brain which make contact with life: we train the eye, the ear, the other senses. There are five of them, we are told; but only two of them play much of a part in educational activities; eyes for reading, ears for hearing. Of course, these have their uses in developing memory and judgment and other mental powers; we are not seeking to minimize the fact for a moment. But we are asking why that other protuberance, so to speak, of the brain, that other and most important implement of the mind, the Hand, is left untrained? Why have we left unnoticed the influence of the Hand on mental powers? Why have we refused to give due weight to the amount of benefit the Hand conveys to the brain and thus to the mind? Why have we deliberately neglected a region of the brain whose development is necessary to a complete thought or act?

Why?—well, we have never thought that the Hand had anything to do with mental training; we have thought that the high object of education has been to lift people above the necessity of using the Hand. Hand-work and brain-work have been put at opposite poles, when as a truth of life there is neither one without the other. The trouble with the world is too much brain-work without the normalizing balance of hand-work. But more of this again.

EDITORIALS

OF THE DEARBORN INDEPENDENT

Congress

WE READ that all the lobbies, greatly increased and handsomely financed, are on the job at Washington again, and it is the judgment of some keen observers that the worst of the lobby proposals are likely to be adopted. If the power combine wants Muscle Shoals, if the spinster politicians want official authority to meddle with domestic maternity in the United States, if the unbalanced humanitarian theorists want children made compulsory idlers until they are eighteen or twenty-one, if interested parties want war with Mexico, there is a better chance of their getting these things than ever before—*unless the people quit reading next day about what Congress has done and begin the day before to tell Congress what it must not do.*

The World Court won in Congress, but lost so heavily in the Country that it was not even mentioned in the President's Annual Message.

If Congress gets the people into the habit of nullifying Congressional action by National sentiment, the reaction will not stop at that.

The great temptation of this present Congress is that it will be dominated by considerations of partisan advantage. The essential dishonesty of this is smothered out of the individual Congressman's consciousness by a strong sense of loyalty. There is nothing to be said against loyalty; few indeed are the sins that are or can be committed in its name; but the only loyalty that Congress can know is loyalty to the Country. Any lesser loyalty, to party or party leader or candidate, leads to overthrow.

There is not a single lobby at work in Washington today that is not using the argument of party loyalty and casting dark hints about the next election. Those who will win the election of November, 1928, are those who will be willing to lose it for righteousness' sake in January or February or March, 1927.

Americans and Money

MR. G. K. CHESTERTON, the urbane and highly intellectual Will Rogers of modern English essayists, has been saying some true and interesting things about America. 'Of all the lies,' says G. K. C., 'the worst lie is that the American worships money. An American never talks of money in the hushed and awestruck tone that an Englishman employs in referring to financial matters.'

Excellent! It might have seemed in ill taste had an American said it. But when an American has listened all summer to courteous Englishmen deplore the 'materialism' and the alleged money-loving propensities of the Americans; and when an American has heard the French and Belgians and Italians and Germans say the same thing, his large international patience shows signs of strain, and a word like that of Chesterton's is refreshing.

For the truth is, England and the Continental nations not only worship money, but grovel before it. It enters into every marriage contract—which is not true in America; it determines every social position—which is not true in America; it controls the entrance doors to universities and colleges—which is not true in America; it has the first and last say in bestowals of title—more than it could possibly do in America; and, in spite of all the exposed scandals in American political life, the concealed corruption due to money in European political life goes wider and deeper. Money rules life in Europe; it does not rule life in America.

Europeans worship money. The chief difference between them and the Americans is that Americans will work for their money, while Europeans want only money that someone else has earned. To earn one's own money is rather honorable in America, but it is very much off color in Europe.

Europeans worship money and therefore attribute to it greater power than it possesses. They think money will rehabilitate Europe—a superstition that could exist only among the most primitive mammon worshipers. Americans know the limitations of money; they know that they can make money, and they know that money cannot make them.

The New Year

THE New Year is a time for looking forward, not backward. It is a time for new tasks, new problems, new achievements. It does not mark the beginning of a totally new era nor the passing of an old, but it does signify the progress the world is making. And that progress is the important thing, after all. With all the blunders that mankind makes, fearful blunders that drench the earth needlessly with blood, and with poverty, and with suffering, the world continues to go forward with amazing persistence. Those who can see but one way—backward, and whose sole ideal is the restoration of the old order, are blind to the benefits of this progress. They cannot understand that the old order has gone forever, that it will never come back, and that even the present order will soon give way to another and better. Change does not always denote progress, but all progress must come through change. And change no longer need be accompanied by hunger and homelessness. With each step forward men learn new facts, they discard old fallacies. They grope nearer to that perpetual Truth which in the end must prevail above all things.

Farm Relief—and the Mortgage

IT WAS in the ten-twent-thirt mellerdrammer that the village Shylock almost foreclosed the mortgage in the third act—and the boy who had gone away to the big city returned in the fourth act just in time to frustrate the villain and save the old homestead. Shylock's paper was spread over the farm, long before we knew we had any agricultural problem or had a host of experts to solve it.

Usually the two are mentioned today in the same breath—the farmer's sad plight, and the mortgage on his property. The latter is represented as partly responsible for the former and the former as entirely responsible for the latter—a sort of endless cycle of trouble.

Did anyone ever stop to inquire just why there are mortgages on the farms of the country? Were they placed there originally because of failure of crops, or were they part of the purchase price of the land—security for the unpaid balance? Careful investigations in some of our leading rural districts disclose that a very high percentage of the mortgages were due to that exigency, for which neither 'hard times' nor a weak 'export market' should be blamed.

This method of acquiring property is by no means confined to the country sections; and certainly it should not be ignored when the cry is raised of heavy losses and heavy mortgages. In more than one case, the farmer took the mortgage with him when he went on the farm. The interest runs on, whether the crop is good or bad; and we seldom hear of any wise agricultural leader, who happens to have his office in the financial centers, suggesting that it be remitted to the farmers who have had a poor crop year.

Shall China Be Dismembered?

AMERICA is not alone the traditional friend of China; this nation is the traditional supporter of Chinese unity. Need for reiteration of that support may be felt in the near future. It was more than a quarter of a century ago, when the great powers of Europe, acting in unison with Japan, seemed about to carve the Chinese Empire according to their own desires, that this country, through John Hay, announced the famous Open-Door policy which served for a time to end the partitioning. Through the years succeeding we have looked with disfavor upon foreign 'spheres of influence,' whether commercial or political. As recently as the Washington Conference the United States insisted upon full recognition of China's political and territorial independence.

But now comes word that the splitting of China into numerous units is highly desirable. We are told that China is already split in actuality, and that refusal to recognize this is refusal to acknowledge a fact. We are told that the present internal troubles of that unhappy country are due not so much to the greed of the war lords as to their desire for independence for their provinces. We are told that China is too huge to be administered as a single political unit; that at least two great states, north and south of the Yangtze River, should be formed. And the possibility of this last appears with the report that Great Britain may recognize the Canton Government of the South without withdrawing recognition from the Pekin Government of the North.

There is no question but that China is at present divided. But it would be a mistake to assume that the Chinese are not basically one, even though they are shattered by internal strife. And the Chinese have the right which is akin to all other races of working out their own destiny. 'China is one tree, not many,' says the Pekin *Leader* rather poetically, 'even though its branches sway and its leaves whirl in the winds which now buffet it from many quarters.'

Divorce as News

ENGLAND in prohibiting the publication of divorce testimony or 'details injurious to public morals' takes a definite move toward cleaner journalism. The question of freedom of the press, raised by some, does not enter in for the simple reason that no political or economic right is abridged. No right of comment is curtailed. All that is done is to prevent the printing of a certain type of unsavory scandal.

The regrettable feature of the case is that the newspapers did not take the step by themselves; they waited for the law to compel them. The same thing is now happening in this country. The pendulum of 'news' has swung so far beyond the line of common decency that it is but a question of time before the State will step in, unless the press itself takes corrective measures. It has been the invariable custom in America to allow institutions a long period in which to remedy their own evils. But if reform does not come, then the people rise up in their own right and abolish them.

Death by Mail

JUST why the United States Government should be not only a distributing but a collecting agency for the sale of pistols to irresponsible persons is one of those anachronisms so puzzling to the lay mind. Under existing laws all a criminal needs to do is to write the nearest mail-order house to receive a pistol by return post. He does not even have to inclose money: the postman on his rounds will attend to that detail when he delivers the weapon. State laws regulating the sale of pistols mean little. Even though all other channels be closed, the criminal can get his murderous instrument through the aid of his kindly Government. But even such good things as this must sometime come to an end. The House of Representatives, stirred by the rising tide of crime, has at last passed a bill barring pistols from the mails. That bill is now before the Senate. With two months still ahead of Congress, there is little reason why the bill should not be enacted into law.

The bay lynx is so stealthy and motionless in its pauses that timid insects and small birds are sometimes not alarmed by its approach.

Getting Better Acquainted With Our WILDCATS

Much Misunderstood Animals

By S. F. AARON

Illustrated by the AUTHOR

The puma is an exceedingly destructive foe of deer. All cats pursue the same of several methods of killing their prey. Commonly, they sever the vertebrae or dislocate the neck.

TO THE unthinking mind the term cat suggests at once cruelty, sneak-thievery, a spitfire disposition and a purring acquiescence which have come only partially and with reservation under the more kindly or tolerating human influences.

With most of our domesticated creatures there remains, in large measure, those hereditary inclinations developed in the wild ancestors of our pets, and even the human species has not got away from brutal influences by long odds. We must put the blame on the necessities of nature for those characteristics not in keeping with man's higher ideals.

Except for the habit of playing with captured prey and thus prolonging its torture through fear, cats are no more cruel than any other predatory creatures and not nearly so bloodthirsty as those of the weasel clan. The mother fox and coyote may often maim their victims so that the active young may learn the art of capturing and killing. The larger cats, tiger and lion, puma, leopard, jaguar and ounce, and some of the medium-sized species including the lynxes, very commonly kill their prey at the first attack. The little fishing cat of Asia, the eyra of America, the wildcat of Europe and the domestic puss are the chief offenders among the *Felidae* and perhaps there is nothing in nature, except man's more intellectual practices, that can surpass in cruelty the habit of holding the injured victims prisoner for many minutes prior to a feast.

The catlike approach when seeking prey is by no means peculiar to cats, for foxes, weasels, wolves, bears, owls and most of the reptiles possess it to almost as high a degree, though few are so well endowed for the purpose, which requires a high order of animal intelligence, and padded feet.

Our American cats represent the extremes in form and coloration that characterize the three groups of the family: the long-tailed, concolored, desert-hued species, as much at home among heavy lowland timber and thicketed growths as on the prairies or in the Bad Lands, the spotted cats that are almost entirely arboreal, and the bobtailed lynxes that some naturalists place in a different genus.

Of the former we have only two species that also represent the largest and smallest in the western hemisphere: the puma or cougar and the eyra cat. Though long known to hunters and naturalists, the big fellow is still the object of much misunderstanding. Its tawny body and size have earned it the name of Rocky Mountain lion, although its long, sinuous, beautifully graceful body and absence of mane give it nothing of the lionine aspect. It has also repeatedly arisen from an inexcusable custom been referred to by naturalists as the largest American cat, 'except the jaguar'; this is much the same kind of error as that of calling the lion the king of beasts, though the tiger is superior in size and ferocity. The largest jaguars do not exceed a hundred and seventy-five pounds with a total length of more than seven feet, while mountain lions have been taken alive weighing over two hundred and fifty pounds, with a length of more than nine feet.

The puma has been extensively written up, yet probably the half has not been told regarding the habits of this wonderfully agile and powerful animal. With the first efforts of American journalism imagination wove yarns of the puma's fierceness that were far from the truth, for there can be no doubt that before the advent of the gun the big, wary cat had inherited a worthy fear of the Indian's arrows and tomahawk. The early naturalists could hardly escape the idea of so large a cat being bold and at times willing to exert its feline ferocity upon man, but later a reversal of this was somewhat

overdone by pronouncing the puma invariably cowardly and never dangerous. The precise truth is that an intelligent wariness and an hereditary fear of man compel its usual caution and apparent cowardice; also that individual cougars differ, as well as conditions, so that there are authentic cases of its having, when driven by hunger, attacked human beings.

The widely published instance of a puma's having killed and partly eaten a boy in the Northwest is true. Probably the lad showed fear when he was followed through curiosity. Had he grabbed a stout stick, or some stones, and faced the animal it would have lost courage and sneaked away. This habit of following a feared enemy, the curious creature perhaps never having before caught sight nor smell of a human, is not uncommon with several wild creatures. Foxes, coyotes, certain birds, as the paisano and at times the ruffed grouse and even the blue-tailed skink, and the black snake possess the habit. The puma persists in this with the most extreme caution. I sat on one side of a deep arroyo and discerned a cougar on the other side, following my companion through the dense chaparral and at a distance of about forty yards. Although at times almost in full sight and in motion it was difficult to pick out the big cat across a space of about seventy yards. I knew a hunter in Tennessee who was followed near nightfall for more than a mile by probably one of the last surviving pumas of that region.

The eyra cat is very little known, either regarding its specific variations or its habits. It is far commoner than generally supposed throughout its habitat, which is all of forested South and Central America, the northern limit being the coastal area some two hundred miles above the Rio Grande. Catching a rare, swift glimpse of one of these little creatures in the mesquite and chaparral thickets one is impressed with the notion that some domestic puss has wandered this far. The several eyra cats I have seen have not much exceeded a large house cat. A closer view will reveal the relatively short legs and long body very unlike that of any other species and suggesting the weasel type. There are pale red, brownish and slightly mottled forms and not so long ago these were considered different species, one receiving the name of *yaguarundi*. The Mexicans give the eyra that name; a silent, wary, sly creature, it finds little trouble capturing the smaller rodents and it often surprises ground birds and rabbits. It is said also to feed upon lizards and harmless snakes and to be an expert fisher among the shallows of the coastal lagoons and low-lying rivers.

THE leopard-like jaguar is the giant of our spotted cats, but is an even handsomer and more richly hued animal, though generally considered less savage and bold than its old-world cousin. It ranges over most of South and Central America and within the wilder forested areas of the southwestern United States as far east as Louisiana and north to the mountains of the warmer parts of New Mexico, Arizona and, originally, California. As of the puma, wild yarns have been told of its killing hunters and threatening camps of prospectors, but beyond authentic cases of its standing its ground and snarling as a warning to someone who invaded its thickets, it appears to hold humans in such respect as never to make aggressive action.

There are two smaller spotted species native to the western tropics: the little margay, not much larger than a domestic cat and of many very different varieties, and the beautiful ocelot, the larger males of which equal in size an airedale dog. Both are also called tiger cats. The margay reaches Central Mexico; the ocelot invades much the same territory, both within and without the United States, as does the jaguar, but it is commoner and may wander more widely over the thicketed areas bordering our prairies. It is, of course, a matter of opinion, but the ocelot will come near to being chosen the handsomest of the new-world wildcats; it even rivals the marbled bush cat of the Old World. The ground color is creamy, silvery-white and russet; the double spots of velvety black are elongated or in rows. The form of the creature is perfectly proportioned; its motions express grace and power and as a tree climber it cannot be excelled among the cats. It climbs to the higher branches and sleeps well hidden throughout the day among bunches of moss that festoon the tall timber. It also lies in wait upon the lower tree limbs of groves and over runways of the smaller quadrupeds, springing down upon such prey as the chaparral cocks, wild turkeys, cactus quail, the wood-rat and smaller rodents, as well as certain reptiles. It would be interesting to know whether, by an easily made mistake, the cat ever springs on a rattlesnake, moccasin or harlequin, as birds of prey sometimes do. The brilliant colors of the latter reptile would tend to warn any sharp-eyed killer.

I have encountered but two ocelots, one among the thick lantana bushes and rock slides of (*Continued on page 23*)

Taking a look around. The bay lynx as you may, by rare chance, get a brief glimpse of it. Its colors blend into the background as distinctly as do those of the rabbit and partridge.

Mass Immigration May Affect

The Rise of an American Race

Ultimate Human Type in This Country

By AARON HARDY ULM

THE boast, 'I am an American,' when made in 1800 had a much clearer meaning, in a racial sense, than it has today. The facts indicate that between the close of the Revolution and perhaps 1830 we were more nearly than at any other period a 'race' or a distinct racial group.

Many wise men of that time were conscious of this. Thomas Jefferson, for example, opposed wholesale immigration on the ground, among others, that it would result in the American people becoming a 'heterogeneous, incoherent, distracted mass,' which they then were not.

The only extraneous group of big consequence in the population then was that of the negroes. The inpourings of these, like the progenitors of old-stock Americans, were much smaller than is commonly imagined. Carey, the accepted authority, says that not more than 330,000 blacks were brought into the country prior to 1808, when the slave trade was abolished. From the 330,000 and a negligible negro immigration since 1808 the 11,000,000 negroes now in the country are descended.

Although in slavery times negro fecundity was promoted, by reason of the property motif, to the point where the black population often nearly doubled in periods of ten years, there has never been any threat of negroes undoing old-stock American whites by 'outbreeding' them.

It is estimated by those who have studied the subject that not more than 250,000 white immigrants came to the country between 1790 and 1820 when the first recording of incomers was done. In 1820 it was estimated that the number of foreign-born and their children and grandchildren was 350,000 in a total white population of 7,866,797. Modern students say the figure is probably too large.

MASS immigration did not set in fully until the 1840's. In the twenties and thirties from 4,000 to 8,000 came annually, mostly from the British Isles.

In 1850, when the census first took account of the foreign-born population, there were in the country 2,244,606 immigrants, mostly Germans and Irish who had come in during the preceding twenty years. The foreign-born constituted about 10 per cent of the white population. The number doubled during the succeeding decade, but in 1860 almost two-thirds of the foreign-born population were made up of German and Irish people.

After the Civil War increasing numbers began to pour into the country from many parts of the world. But it was not until the late 1880's and the 1890's that the Southeast and East Europeans began to exceed in numbers the so-called 'Nordics' coming from Northwestern Europe. Thus the bulk of immigrants arriving up to a period close to that of the present generation was of stocks closely related to those making up the old American population.

THE first big inpourings were of racially congruous types—Irish, Germans, Scandinavians—though the bulk of them spoke other than the language of the country.

Meantime, the old stock multiplied at a decreasing rate on the whole, yet at a rate which for the entire 19th Century was extraordinary. Census Bureau experts figure that it increased nearly sevenfold, or 687.1 per cent, during the century. During the same period the population of Europe—which, because of industrialization, broke by far all previous records of growth there—increased 119.4 per cent. The biggest rate of increase in Europe was in Belgium, where it was 204 per cent.

Those figures should not be overlooked in considering the question of whether it is likely that immigrant stock will 'outbreed' that of old American strain.

The predominant factor in this strain is of British origin. The population of Great Britain in 1712 was approximately 9,000,000; in 1800, 16,200,000. Adam Smith said in 1776 that it had been doubling only about every five hundred years. But in 1900 the population of Great Britain was 41,000,000; it had doubled, and more, in one hundred years.

Writing with reference to British strains here and elsewhere, Census Bureau experts have said:

'The spectacle is presented of a nation which not only increased more generously than did any of its rivals, but at the same time created other nations, one of which produced a native population nearly equal to that of the mother country. It is possible that a racial growth similar in character may have taken place in connection with some of the colonies established by ancient cities along the Mediterranean, but in magnitude there appears to be no parallel in history for the population achievement of the British race from 1700 to 1900.'

The American branch of it achieved much more remarkably than did the British race as a whole, as do portions of that branch now, notably the one found in the Southern states.

The descendants of the 40,000 original New Englanders now comprise millions found in all sections of the country. But when immigrants began to overwhelm that section the fecundity of New England stock was checked until now, in its original sphere, it may not be increasing at all. Branches of it, however, in the Middle and Far West, are still increasing at a fair rate.

It is probable that old stock of the South has contributed more toward the present population of the country than that of New England, because there has been no such retardation in the South as in other sections.

It is estimated that 5,000,000 whites, mostly of pure Colonial ancestry, migrated from the Old South into other parts of the country between 1860 and 1900. Yet the white population of the South has grown faster than the negro population there. White emigration into the Old South has not been numerically important. At the same time, the South sent far more whites into the North and West than it sent negroes.

THE record of the multiplication of old white stock in the South has been used in testing the contention, which many have made, that had there been no immigration, the native population of the country would be practically as numerous as it is. Thomas Jefferson contended in his *Notes on Virginia* that, in the long run, natural increase would populate the country as rapidly as if assisted by wholesale immigration. The only affect of immigration on numbers, he held, would be to anticipate growth in population.

General Francis A. Walker, director of the census in 1890, reasserted the doctrine, as others have done since then.

Census Bureau experts found in 1909 that had the old stock in the country as a whole continued to increase as in the South, the native population in 1900 would have been practically as it was with immense contributions from new stock.

Census experts have held more recently that while the contention is 'reasonably correct,' the reason for it

is more complex than the one hitherto given. General Walker and others said that old Americans hesitated to rear large families in competition with immigrants accustomed to low standards of living. Yet in the South a similar competitive factor, represented by the negroes, has not kept the whites from increasing at a rate which in recent times has been about twice that of old-stock whites in the rest of the country.

So Census Bureau folk now hold that the lowered birth rate among old-stock whites is chiefly due to the fact that immigration hastened the development of social conditions which tend to curb increase in all the native population, old and new. The chief of these presumably are urbanization and augmented industrialism. Large families used to be the rule among old-stock Americans because, primarily, labor was scarce and land was plentiful.

LABOR is there so well rewarded,' wrote Adam Smith of America in 1776, 'that a large family of children, instead of being a burden, is a source of opulence and prosperity to parents. The labor of each child, before it can leave the house, is computed to be worth a hundred pounds clear gain to them. A young widow with four or five children, who, among the middling or inferior ranks of people in Europe would have so little chance of a second husband, is there frequently courted as a sort of fortune.'

But when immigrants came to supply this needed labor and to hasten the exhaustion of free land and the expansion of cities, old-stock Americans lost this incentive to multiply.

If this theory is correct, the finding has important bearing on the evolution of an American race or distinct racial group. For the conditions bear ultimately on new stock as validly as on the old.

In fact, Census Bureau statisticians have found that the apparent tendency of the immigrant groups to increase much more generously than do old-stock groups is largely an illusion. Even the birth rate among newcomers as a whole is evidently not much higher than that for native stock when full weight is given to probable rates in non-registration areas of the South. It is much higher, however, in those localities where immigrants concentrate in large numbers.

Moreover, it has been found that the birth rate among the children of immigrants is probably not so high as among other natives. One reason for this is that the children of immigrants, even those of mixed immigrant and native parentage, marry less freely—a fact only recently discovered.

So the Census Bureau is now inclined to the belief that the rate of natural increase is relatively the same for both old and new stock, as wholes.

CONDITIONS may be more favorable to continued gains in old than in new stock by natural increase. One reason for this is that old stock is less urbanized than new—much less so than the outstanding new kinds that have come in during the last thirty years. Birth rates invariably are higher in rural than in urban districts.

On the assumption that old and new white stock increases at equal rate, Census Bureau statisticians hold that the two, at the time of the last three censuses, were as follows:

Year	*Equivalent Population*	
	Old	*New*
1900	37,290,000	29,520,000
1910	42,420,000	39,000,000
1920	47,300,000	47,490,000

The gains by the new on the old are accounted for chiefly by the tremendous number of immigrants that came in recent times.

When it is remembered that the white population in 1790 was only a little more than 3,000,000 and that approximately 37,000,000 immigrants have come in since 1820, the comparative showing certainly is not unfavorable to the old American strain.

Unfortunately, basis data for exact findings are lacking. A record of emigration, for example, has been kept only since 1908. The census never took account of the children of foreign-born until 1890 and the national one has never gone beyond the second generation.

Yet there are sufficient data for fair approximations as to the component strains in the present population. John B. Trevor, who made an analysis for the Immigration Committee, United States House of Representatives, holds that, as to original sources, the population in 1920 was as follows:

Origin	*Per cent*
Northwest European	75.4
South and East European	13.2
All others	11.4

The Northwest European element includes that which came via Canada, New Foundland, Iceland, Australia and New Zealand as well as that which came directly from so-called Nordic countries of Europe.

THE South and East European includes most of that from Mediterranean and Alpine, or Slavic, stem sources, as well as the Russian and other Eastern Jews.

By all others are meant the Negroes, Orientals and those creditable to the West Indies and Latin America.

Taking the white population alone, Trevor finds that 83.7 per cent derives from Northwest European peoples, while only 16.3 per cent is from South and East European sources.

He distributes the Northwest European stock as follows:

Source	*Per Cent All American Whites*
Great Britain and North Ireland	57.5
Germany	14.5
Ireland	6
Holland	1.2
Scandinavia	4.5

The South and East European sources that have credits of one per cent or more are as follows:

Source	*Per Cent*
Italy	3.8
Poland	3
Russia	2.7
Greece	1.4
France	1.2
Hungary	1

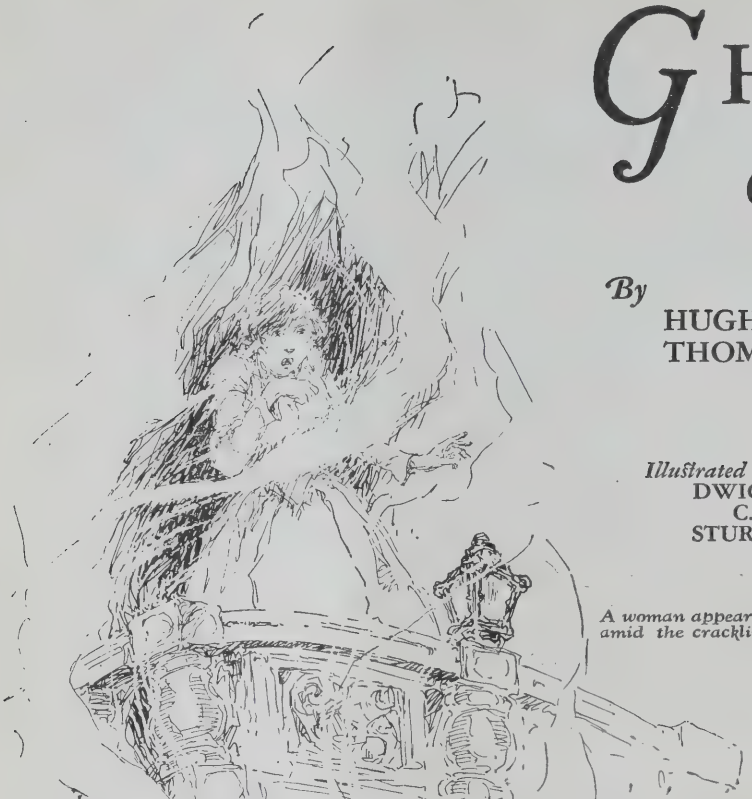
GERALD VAN DER HEYDEN

It is thus indicated that old stock and its kind still are highly preponderant in the population of the country. Evidently the immense mass immigration of the last seventy-five years, while making a dent that isn't yet fully apparent, can bring about a change of not more than ten to fifteen per cent in the nature and ratio of ingredients that the country had in 1790 for the making of a race. The dent is not yet fully apparent for the reason that the mass of immigration of 'extraneous' racial type has been absorbed in only slight extent by the older and more homogeneous elements.

GHOSTS of the SEA

By HUGH THOMASON

Illustrated by DWIGHT C. STURGES



A woman appeared on deck amid the crackling blazes.

THERE is no man more sensitive to ridicule than the sailor. He detests the merest suspicion of being laughed at, and, while among themselves in the fo'c's'le sailors yarn endlessly, it is most difficult for the landsman to get a seaman to talk freely. Even then, one doubtful look or word of disbelief and he shuts up, close as the proverbial oyster.

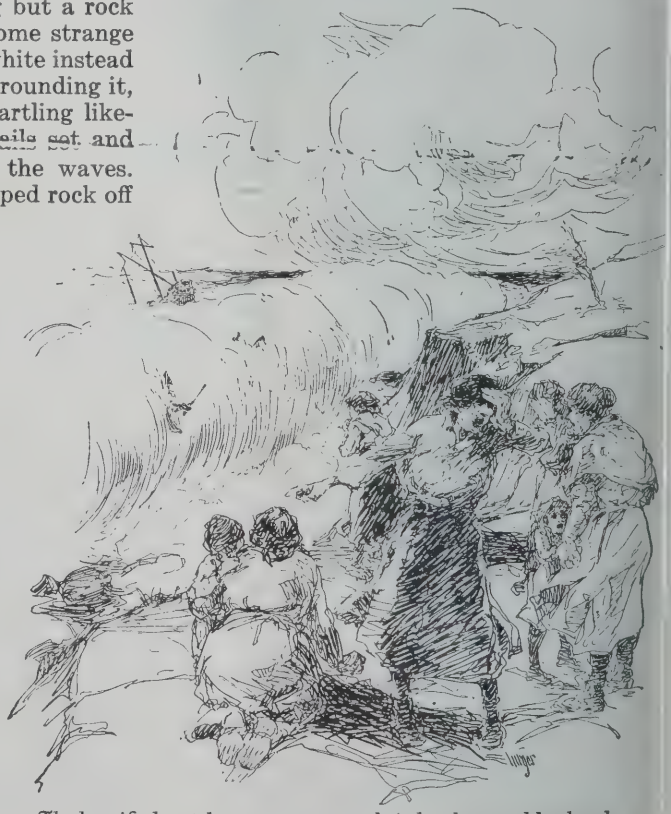
The consequence is that landsmen never hear of the strange things that happen at sea.

Many of these supposedly supernatural appearances are doubtless explainable from natural causes. To take one instance, the mystery of the well-known phantom ship of Cape Horn has recently been elucidated. Over and over again vessels on their way from Europe to Western America via Cape Horn have been startled by the sight of a large ship with decks awash drifting in an almost impossible position beneath the giant cliffs of the Straits of Lemaire.

At night or in a storm this bark with her towering white sails has the strangest appearance. The *Crown of Italy*, attempting to go to the aid of the supposed derelict, ran upon a reef and was wrecked, and a similar fate has befallen several other vessels. During the year 1907, at the request of the United States, the Argentine Government sent a steamer to make researches. It was found that the supposed phantom was nothing but a rock—a rock which, by some strange freak of nature, was white instead of black like those surrounding it, and bore the most startling likeness to a ship with sails set and deck just level with the waves. Another strangely shaped rock off St. Helena, whitened with sea birds, bears so exact a resemblance to a full-rigged ship that the oldest and most experienced seamen have been deceived.

Mirage, again, may account for some of the specters which have puzzled and alarmed mariners. Mirage is a phenomenon not confined to sandy deserts, for it is seen over snow and glaciers and also at sea. In 1854 H. M. S. *Archer*, cruising in the Baltic, saw the whole of the British fleet of nineteen ships inverted in the air apparently only a few miles away. At the time the fleet was actually hull down, the nearest ship being more than thirty miles from the *Archer*.

But apart from such natural phenomena, there are things seen at sea by no means so easy of explanation. We have no less credible witness to the appearance of a true phantom ship than the present King of Great Britain. The incident is recounted in *The Cruise of Bacchante*. On July 11, 1881, at four o'clock in the morning, a spectral ship crossed the bows of the vessel in which Prince George and his brother were cruising round the world. The apparition is described in these words: 'The Flying Dutchman crossed our bows. A strange red light, as of a phantom ship all aglow, in the midst of which light the masts, spars, and sails of a brig two hundred yards distant stood up in strong relief. Thirteen persons altogether saw her but whether it was Vanderdecken or the Flying Dutchman, or who else must remain unknown. The *Tourmaline* and *Cleopatra*, which were sailing



The horrified watchers on shore saw their brothers and husbands instantly swallowed up.

a our starboard bow, flashed to ask nether we had seen the strange red ght.' It is a curious fact that six hours ter the able seaman who was the first t sight this terrifying apparition fell om the fore-topmast crosstrees and as smashed to pieces.

The so-called Flying Dutchman is e best known all ghostly anderers of the cean, and his ory the most miliar. The nerally accpted version is at Cornelius anderdecken, a utch sea captin, was on his ay home from Batava when, in trying to und the Cape of ood Hope, he met ith baffling head inds, against which he ruggled vainly for ne long, weary weeks. t the end of this time, ding that his ship as in precisely the me position as at the eginning, Vanderecken burst into a rce fit of impious assion, and, dropping n his knees upon the ck, cursed the Deity id swore by heaven id hell that he would ound the cape if it ok him till the Day Judgment. Taken his word, he was omed there and then beat to and fro for l time, and sailors' perstition connects e appearance of his hantom ship with certin and swift misrtune.

All sailors believe that, while specter ships usually hail any vessel which they meet, it is the height of bad luck to reply in any way.

Vanderdecken is not the only ocean anderer in the latitude of Cape gulhas. There is another Flying utchman in the shape of Bernard okke. Fokke, who lived in the latter alf of the 17th Century, was very ifferent from the ordinary type of ollander. He was a reckless fearothing, who boasted that his vessel ould beat any other afloat. To make ood his boast he cased her masts in on and crowded more sail upon her han any other ship of that time dared arry. It is on record that he made he passage from Rotterdam to the ast Indies in ninety days, a feat at hat period savoring of the miraculous.

The story goes that in his anxiety o beat even his own record, Fokke old his soul to the Evil One, and at his ife's end he and his ship both disppeared. Transported to the scene of his old exploits, and with no other crew then his boatswain, cook, and quartermaster, he is condemned to strive endlessly against heavy gales that ever sweep him back.

Whether the phantom ship be that of Vanderdecken or of Fokke, the fact remains that nine-tenths of all the reported appearances of phantom ships are between the fortieth and fiftieth latitudes. Nor has the age of steam killed the tradition, for a year rarely passes without some vessel sighting one of these ghostly wanderers of the ocean. All sailors believe that, while specter ships usually hail any vessel they meet, it is the height of bad luck to reply in any way.

Phantoms of the sea have frequently been seen off various parts of the British coasts. In the old days Cornwall was notorious for wreckers, who worked their will along the iron-bound cliffs. Priest Cove is believed to be still haunted by one of these gentry, who during his lifetime preyed on the spoils of unfortunate vessels lured ashore by a false light hung around the neck of a hobbled horse. The wrecker is seen on stormy nights, but no longer on shore. He clings to a fragment of timber among the breakers, and is eventually dashed upon the rocks, and disappears in roaring foam.

The fishermen of the rugged coast of Kerry have another legend connected with the fate of wreckers. One winter morning, early in the 18th Century, a large ship was found, mastless and deserted, wedged among the rocks of that deadly coast. The wreckers eagerly pushed off, and to their joy found that the galleon was laden with ingots of silver and other rich produce of Spanish America. They filled their boats to the water's edge, and were eagerly pulling back when a monstrous tidal wave came rushing up out of the west. The horrified watchers on shore saw their brothers and husbands instantly swallowed up, and when the wave had broken not a sign remained of boats or men or ship. Upon each anniversary of the day the grim tragedy is said to be reenacted.

The Solway has more than one phantom craft. Centuries ago two Danish sea rovers, who had spent a lifetime in deeds of crime and cruelty, put in to Solway with their long ships heavy laden. A sudden furious storm broke, and the overweighted ships sank at their moorings with all on board. Upon clear nights these two vessels, with their high curved prows and rows of shields along the gunwale, are sometimes seen gliding up the estuary, but no money would tempt the local fishermen to go out to meet them.

The story is that about a century and a half ago two young men, well primed, did row out to investigate. They were seen to approach the ghostly visitants, when suddenly the galleys sank, and the boat and its occupants, drawn down in the swirl, were never seen again. The so-called 'spectral shallop' of the Solway is the apparition of a boat which was maliciously wrecked by a rival while ferrying a bridal party across the bay. It is

He saw that he had a bedfellow, a corpse with one eye staring, and a red beard tangled with seaweed.

manned by the fleshless ghosts of the wrecker, but the only ships which it approaches are those which are doomed to wreck or disaster.

The rocky coasts of New England are haunted by several ghost ships. Of these the specter of the *Palatine* is the best known, and her appearance flying down Long Island Sound is generally recognized by fishermen and coasters as a forewarning of a disastrous storm, Her story is a terrible one. The *Palatine* was a Dutch trader which, lured by false lights exhibited by wreckers, went ashore on Block Island in the year 1752. Having stripped her, the wreckers, to conceal all traces of their crime, fired her. As the tide lifted her and carried her, wrapped in flames, out to sea, shrieks of agony burst forth, and a woman, presumably a passenger who had bidden herself in fear of the wreckers, appeared on deck amid the crackling blazes. Next instant the deck collapsed and she vanished.

The New Haven ghost ship is, like the *Palatine*, an omen of disaster. In January, 1647, a vessel built at New Haven sailed on her maiden voyage. In the following June there came one afternoon a furious thunderstorm, and after it was over, and about an hour before dark, the well-known craft was sighted sailing into the river mouth—but straight into the eye of the wind! People crowded on the shore to watch her, but while still a mile or more away she slowly vanished from sight.

It was agreed that the apparition signified that the ship herself had been lost, and, in fact, she never was heard from again. Longfellow has written a poem embodying the story, of which one verse may be quoted:

> And the masts with all their rigging
> Fell slowly one by one;
> And the hull dilated and vanished
> As a sea-mist in the sun.

The storm-ridden Gulf of St. Lawrence is still haunted by the flagship of a fleet sent by Queen Anne against the French. The fleet reached Gaspe' Bay, when a fearful gale rose suddenly, and one after another the ships were driven on the rocks and broken to pieces or sunk. It was under the tall cliffs of ill-named Cape d'Espoir that the flagship came to her end, and upon each anniversary of the wreck the sight is repeated. Her deck is seen to be covered with soldiers, and from her wide, old-fashioned ports lights stream brightly. Up in the bows stands a scarlet-coated officer, who points with one hand to the land, while the other arm is round the waist of a handsome girl. Suddenly the lights go out, the ship lurches violently, her stern heaves upward, and screams ring out as she plunges bow-foremost into the gloomy depths.

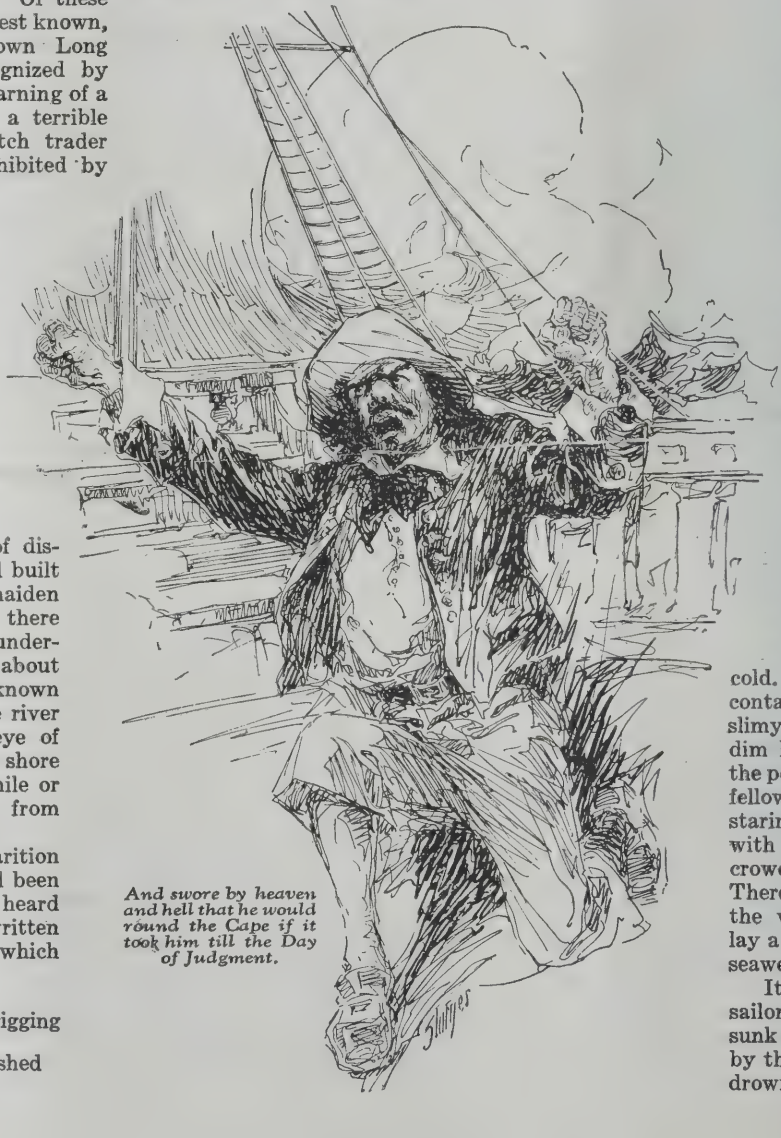
There are other sea phantoms besides apparitions of vessels, and not all are portents of misfortune. Some, indeed, are kindly in intention. Such was the drowned man who appeared in the middle of the night to Captain Rogers, of H. M. S. *Society*, and warned him to go on deck and have the lead cast. He did so, found only seven fathoms, tacked, and when morning came saw himself close under the Capes of Virginia instead of, as he had imagined, being more than a hundred miles out at sea.

A well-known novelist has written a most gruesome story of a ghost which invaded a cabin of a modern liner, and lay in its accustomed berth, dripping with salt water and festooned with seaweed. It is a very old belief among sailors that the ghost of a drowned man returns in this fashion. In Moore's *Life of Byron* it is related that a certain Captain Kidd told the poet how the ghost of his brother (then in India) visited him at sea and lay down in his bunk, leaving the blankets wet with sea water. He noted the time and found that it corresponded exactly with the hour at which his brother was accidentally drowned.

A similar incident occurred much more recently in the United States Navy. Thirty-nine years ago the old U. S. corvette *Monongahela* had a paymaster, a red-bearded man with one eye, who was known throughout the service as one of the best story-tellers in the navy. He was a most popular man, but his love of whisky eventually brought him to his end. He died on board and before his death he said to the other officers, 'Dear boys, you've been good to me, and I love you for it. I can't bear to think of leaving the ship, and if I can I shall come back, and you'll find me in my old cabin, No. 2 on the port side.' Although nobody acknowledged that he believed 'Pay' would come back, yet No. 2 remained vacant for three cruises.

Then Assistant Paymaster S—— joined the ship, and having, as he said, no superstitions, installed himself comfortably in No. 2. All went well and they were homeward bound when one night in April, the whole ship was terrified by unearthly screams. The officers rushed out, and there was S—— in a heap on the deck outside his cabin. When asked what was the matter, he gasped out, 'A dead thing—a corpse in my berth—one eye and a red beard. Horrible!' When he had recovered himself a little he explained that he had awakened, feeling very cold. As he moved he came in contact with something clammy, slimy, and cold as ice. By the dim light which leaked through the port he saw that he had a bedfellow, a corpse with one eye staring, and a red beard tangled with seaweed. The officers crowded into the door of No. 2. There was no corpse, but—on the wet and tumbled blankets lay a few fragments of barnacles and seaweed!

It is a common belief among sailors that a ship which has been sunk and raised again is haunted by the ghosts of those who were drowned.



And swore by heaven and hell that he would round the Cape if it took him till the Day of Judgment.

South When You Mean North

By F. J. CLIFFORD

[F THAT is a fixed habit with you—this pointing in a direction opposite the place you are discussing—then it is nearly certain you faced the rong direction when learning geography.

Look at a map of the Western Hemi-here. The top portion—that part held rthest away—is always printed to the rth. Hold your map facing that direction. you chance to be located in Central North merica, the map will show the Atlantic cean to your right. Even so it is. To the ft is the Pacific Ocean. Correct again.

Now turn and face the south. Your ap still maintains that the Atlantic is to ur right. Is it? No indeed. Raise your ght hand and it points to the mighty acific. Also—the map shows you are oking toward the Arctic Ocean. But you e not. You are looking toward Old Mexico id the Gulf.

Next—locate one of the innumerable hoolrooms that face the south. They are attered all over America. Children are udying geography. Perhaps a door in ont of them is open, or a window may be iere. Through it they see familiar country. hey have been taught that that way is uth. Glancing down at opened geography ooks, they study a lesson of the Eskimos id their funny igloos in the rctic. The map tells the young udents they are looking that ery way. They visualize—lo-ite the snow people far beyond ie familiar fields—*southward.*

Or the window may be to ie east. A boy gazes through —daydreaming. (No teacher as been able to smother it.) nd in his daydreaming he sees ndians, buffalo, grizzly bears, olves and great rolling plains f the West. That is what he as been reading about in his eography book. And an ac-ompanying map tells him he is oking that very way—to his ft—out through the open indow—*eastward.* Is there any hance for that boy or his choolmates to keep their di-ectional sense straight? Mighty ttle.

True—there is a small arrow o one side warning the reader hat the map is made to face he north. But that obscure echnicality is lost on most young minds. It s smothered in the steady grind of sitting ith faces to the south day after day, month fter month, year after year. The result is wisted directions branded so deeply in hose keenly receptive young minds—*that iey can never be fully righted.*

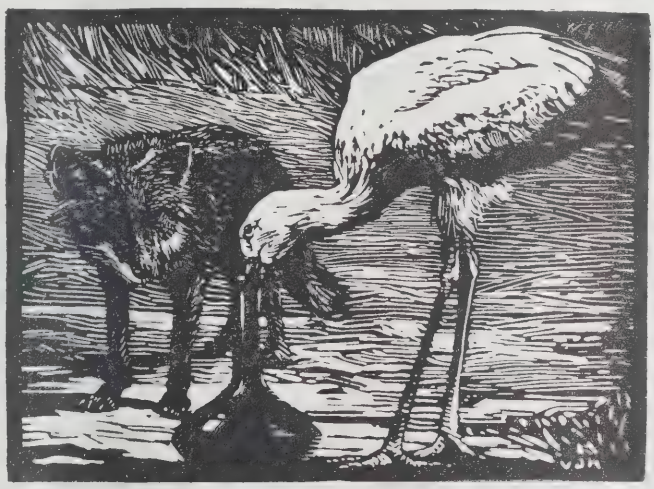
Directional sense differs considerably mong people. Some students can sit in a choolroom and study maps of distant ands with never a thought of their being o the north, south, east or west. A few, very few, will not know the direction they re facing.

But the other students—and I believe hey form a goodly majority—keep their irections in mind wherever they may be. nd keeping them in mind, it is only natural or the scholar to picture the north country straight ahead, the way they are facing, no matter if it be to the south, east or west.

Notice the people who have the habit of pointing opposite the place they are talking about. Then tell them which way they faced in early school years. It will be found both amusing and instructive. The majority of people will be surprised when the how of it is explained to them. It will elicit many personal experiences that vary from the ludicrous to the near tragic. The writer has listened to many in fifteen years of prying into the little-discussed subject.

One was told by a man from Montana. Unthinkingly, he pointed the opposite way in giving directions to a belated tourist. Instead of putting up at a warm hotel to the eastward that night, he landed in a snowdrift at the foot of the Rocky Mountains. A physician saved the most of two badly frozen feet.

The Montanan was greatly disturbed over the affair. He made a strenuous attempt to correct his directional sense but found it impossible. His surprise can be imagined when it was proved that faulty facing in early school years was the seat of his troubles. It had been a sort of skeleton-in-the-closet with him—a something that he alone possessed—a persistent reminder that he might be a bit off in the head.



Pen-and-ink impression by GERALD VAN DER HEYDEN

A critic to whom I sent an article on the subject sent me the following facts: 'For eight years in a country school I looked at a set of maps hung on the south wall of a schoolroom. As a result all my directions are reversed. I naturally think of the north-west as in exactly the opposite direction from what it is. When I began teaching in a rural school, I immediately hung all the maps on the north side of the room and had my map study from geography conducted with the pupils facing the north.'

Some schools may know about it and may be correcting it, but to date I have not found such. Far more schoolrooms are found facing the south, east or west, than those facing the north. I have questioned persons, from parents to professors. The subject was an entirely new one to the majority. And very few of the learned profession could be induced to give an opinion concerning the correctness of my contention.

One, a high-school inspector, listened with more than usual interest.

'Your idea is certainly new to me,' he said. 'But for all that, I think it deserves serious consideration.'

So I asked him to present it at the first meeting of the state educational board.

'That might do some good,' he replied. 'But much more would be accomplished if it were given publicity in some national magazine—one devoted to serious thought —.' And he named two or three.

We spent part of an afternoon together. He suggested the following conclusions:

That faulty directional sense through improper facing of pupils would be more pronounced in rural districts than in the graded schools. The same handicap might accrue through the improper hanging of maps, whether in the graded school of the city or one-room schoolhouse of the country.

Although the grade-school pupil is shifted about from room to room, there would be a strong likelihood of his mind-picturing becoming faulty if he faced the wrong direction when studying maps. Especially if two or more succeeding rooms faced the same wrong way.

More stress should be laid on the teaching of direction in the schoolroom. That simple lesson is often lost sight of in grappling with supposedly bigger things. The directional sense when fully and correctly developed is a most important help.

'But the plan nowadays is for one-way lighting,' said one objector. 'It is impossible to place all schoolrooms facing the north.'

Which is all true enough. But a little planning and changing about so that one or more rooms do face the north for pupils in the study of maps is surely not asking too much. At the very least, *no harm could come through facing them the right way.*

Most persons with misplaced directional sense are only that way with distant, out-of-sight places. They can look at the nearby country and feel that north is north and south is south. But when they think or speak of some place they cannot see—a distant city, a railway line, a national highway—it is then they are all jumbled up.

There has been a deal of criticism directed at our modern educational system. Just how much is merited is open to argument. But one thing is certain. The allowing of hodgepodge directional location of schoolrooms is a blot on the record of people who have been hired—who have the responsibility of preparing a nation's children for their life work.

How One Roosevelt Conquered *the* Father *of* Waters

By B. G. HUMPHREYS

IN 1809 Nicholas Roosevelt, of New York, a gentleman of education and inventive genius, possessed of a determined spirit for bold and adventurous enterprise, went over to Pittsburgh and built a flatboat, and, accompanied by his wife, boarded it and floated down the Ohio and the Mississippi rivers to New Orleans. It took six months to complete the journey.

The purpose of his trip was to collect all possible data touching the currents, eddies, shoals, and so forth, his intention being to build a steamboat for service on its lower reaches. Fulton and Livingston were associated with him, or rather were to be, if upon his return to New York his report satisfied their judgment that the scheme was feasible.

The trip required six months, but the information gained was well worth the labor, and upon his report to his colleagues, Roosevelt was set to work at once to build a steamboat for the Natchez and New Orleans trade.

It was necessary to take with him to Pittsburgh shipwrights and artisans from New York, as only the common carpenter could be found then at that distant outpost. The timbers, knees, ribs, and so forth, were found in the mountains and floated on the Monongahela to Pittsburgh. The planks were made by the old ripsaw process. Describing the building of the ark, Erwin Russell says:

Old Noah kept a-chipin' and
a-nailin' and a-sawin',
While all the wicked neighbors
kept a-laughin' and a-shawin'.'

This was exactly what happened at Pittsburgh in the summer of 1811 where his adventure was regarded by all as the foolish and iridescent dream of an impractical though daring enthusiast. In September of this year the boat was completed and ready for the voyage. She was christened the *New Orleans*, was 116 feet long, 20 feet beam, the engine had a 34-inch cylinder and the total cost was $38,000. She had two cabins, one aft and of four berths. This was the ladies' cabin. The other was forward and less pretentious.

Having first made a short trial trip up the Monongahela, Mr. and Mrs. Roosevelt, the captain, Engineer Baker, Andrew Jackson the pilot, six deck hands, two female servants, a man waiter, a cook, and a Newfoundland dog named 'Tiger,' went aboard the *New Orleans* for the first trip ever made by a steamboat on the Mississippi River. Crowds gathered to watch the departure and wave good luck and goodby as the little craft glided off into the current of the Ohio.

On the second day after leaving Pittsburgh the boat reached Cincinnati. A great crowd gathered on the bank to view this strange craft, and after being assured that 'your boat may go down the river, but as to coming up it, the very idea is an absurd one,' Roosevelt proceeded on his journey.

They reached Louisville late at night on the second day out of Cincinnati, and when the patter of its wheels and the roar of the steam were heard by the awakened citizens, they rushed posthaste to the scene of the disturbance confidently expecting to find the fallen comet sputtering if not disporting in the river.

Everybody there, as at Pittsburgh and Cincinnati, knew that this wild experiment was a mad and foolish challenge to the forces of nature and they all made bold to tell him so. Everybody, I should have said, except the bold and intrepid Roosevelt and his equally valiant crew.

When he reached Louisville the river was too low to enable him to pass over the falls and he was perforce compelled to abide his time until the friendly elements would send rain to the upper watershed.

It is a fact perhaps worthy of note, as illustrating the times of which we are writing that while the *New Orleans* was tarrying at Louisville, Mrs. Roosevelt received a visit from the stork. This, her second son, being the first baby born on a steamboat on the western waters. Later we will see that the first courtship and the first marriage were also incidents of this historic voyage.

To relieve the ennui of his vexatious wait for the long delayed rains, Mr. Roosevelt steamed up the river and paid another visit to Cincinnati. To Roosevelt at least this feat accomplished with all ease, was probation strong as proofs of holy writ, and when the welcome rise at last came down the river he renewed the voyage with confidence. A multitude gathered along the shore at Louisville to witness the perilous descent across the falls and down the rapids.

Mr. Roosevelt, though quite confident in his enterprise, out of a spirit of abundant caution suggested that Mrs. Roosevelt leave the boat and rejoin them below the falls, but she would have none of it.

The river was not high, but the rise had ceased and the stage was stationary. He believed there was a margin of safety over the falls, and lacking in news facilities from the upper reaches, he feared delay might mean another soul-racking wait, and so he determined to make the run, and after some exciting experiences, successfully accomplished it.

J. H. B. Latrobe, a brother of Mrs. Roosevelt, writing of this trip in 1871, in the Maryland Historical Society paper says:

One of the peculiar characteristics of the voyage was the silence that prevailed on board. No one seemed disposed to talk; and when there was any conversation, it was carried on in whispers, almost.

Before the trip had ended it developed, to the surprise of the party, that other darts had been flying than those shot from the Indian bows. The captain of the boat had looked upon Mrs. Roosevelt's maid and he 'saw that she was fair.' The result was that a priest was at hand when the boat reached Natchez and the marriage took place aboard.

The romance of the voyage ended at Natchez where Mr. and Mrs. Roosevelt were received with great cordiality.

They reached New Orleans January 1, 1812, and the captain, according to Gayarre, stated that he had been but 259 hours actually on the way.

And That's How It Was

Wihla Hutson

I DID a favor yesterday,
A kindly little deed . . .
And then I called to all the world
To stop and look and heed.
They stopped and looked and flattered me
In words I could not trust,
And when the world had gone away
My good deed turned to dust.

A very tiny courtesy
I found to do today;
'Twas quickly done, with none to see,
And then I ran away . . .
But someone must have witnessed it,
For—truly I declare—
As I sped back the stony path
Roses were blooming there!

Vicente Blasco Ibañez

(*Continued from page 3*)

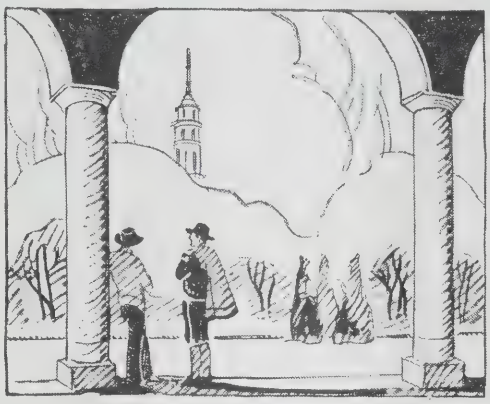
te first touch of the real Ibañez I got. I arrived at length at an imposing teway labeled 'Fontana Rosa.' I pulled e bell and a man who was washing several h-priced automobiles in succession before roomy garage came with a frown and arded me suspiciously. He spoke little ench and I spoke less, which added to-ther made less yet. Finally, he told me I d better go round to the main entrance d find out what I wanted. The main trance consisted of a still more imposing teway. This time a frowning woman, viously Spanish, answered the bell, arded me suspiciously and left me out-le the gate while she disappeared some-here inside. Soon a young man in a yed duster appeared and frowned sav-ely and suspiciously at me. I explained o I was and why I had come. He opened e gate and welcomed me. He was Señor añez's (Ee-bahn-yeth, he pronounced it) cretary and had written the letter asking e to come.

As we approached a small outhouse, nich proved to be Señor Ibañez's work-op, I was signaled to don respect as ough it were a garment. We entered a llway separated from the main chamber e a heavy portière. The secretary pointed thin for me to look. The great Ibañez t there posed in an attitude of heavy work.

I was then ushered into a long room, the les of which were lined with several thou-nd volumes of books in all languages. akespeare and Thackeray were among the nglish. Most of them were in Spanish, owever, and prominent among them was *on Quixote*. Be-des the books, the om was filled ith truck and ings not beauti-l; a sort of lum-r room for all his erary and other uvenirs. There as an elaborate ronze, for in-ance, of *The Four orsemen of the pocalypse* with an scription saying was the gift of ex Ingram, the otion picture di-ctor who pro-uced the film ver-on of the famous ory.

There were attered photo-raphs of groups herein Ibañez as always the entral figure; gned photographs great people 'to bañez'—Anatole rance, and Emile ola, among others; his picture taken with a roup of French generals at some un-eiling; picture of a dinner given him by the louse of Representatives in Washington; nother of a dinner given him by the Ameri-an Booksellers' Association with him sitting by the 'sohn of Roosevelt,' as he proudly told me.

The first contact with Ibañez consisted, then, of the ceremony of the pictures, as we might call it. Our interpreter had arrived—a chic little French madame—and we were escorted around the room and made to give obeisance to each of the objects in turn. Ibañez would stand in the background and wait until we were all set, then he would come forward and point to himself in the picture and say, 'Ibañez!'



AS I SAW Blasco Ibañez, he appeared to be a man of about fifty-five. He wore a brown cloth smoking jacket somewhat the worse for wear, very baggy trousers slightly frayed where they fell over the 'sneaks' —as we used to call rubber-soled shoes when I was a boy—which he wore. The fore-top of his head was bald; beyond that was a heavy fringe of gray-black hair. His face was severe, or a trifle petulant, I might say, and very, very solemn. He remains almost immobile until he becomes really interested in what is going on, and instantly he becomes like a bunch of fireworks and a galvanic battery in one. Nothing can then brook the flow of his words and ideas.

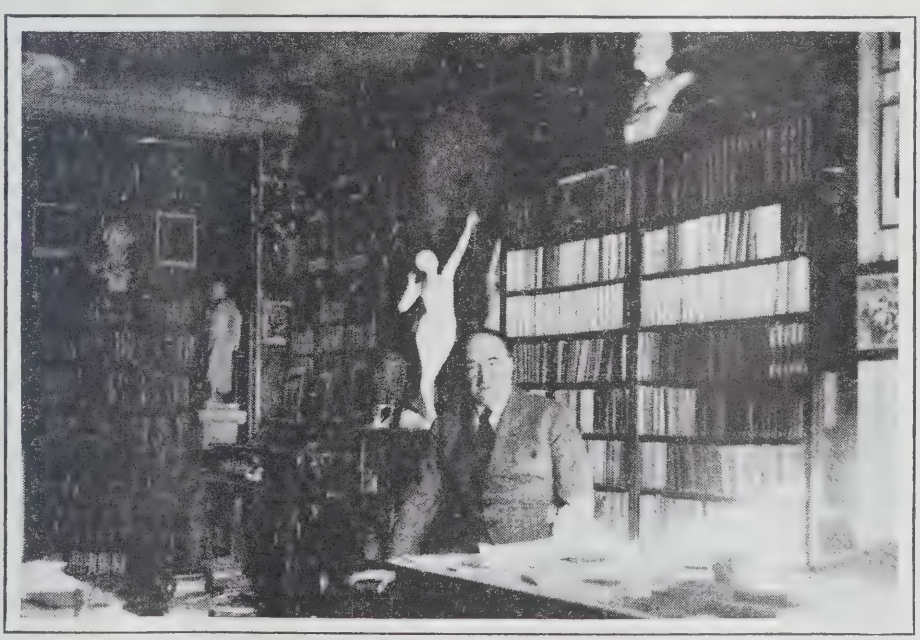
I imagine that he must be that way when he writes—he sits and first thinks a very great deal and then his thoughts suddenly come tumbling out with the passionate outburst of an avalanche and he endeavors to set them down. The moment he gets thus excited, his hands begin to gesticulate and his voice rises in trembling, pas sionate tones and he is all fire and eloquence and it is then that you can feel in gusts the same thing that he has so effectually put in his books after long periods of deep thinking—sweeping description, penetrating pathos and staggering philosophy. He is a delightful mixture of petted child of fortune, racy raconteur and savage savant. His personality is so pronounced and his words so precious that he is interesting at all times.

We ventured first to ask Ibañez about some of the things he had done in the past. He regarded us with a rather withering look.

'With the past I am not concerned,' he said solemnly. 'I am not like one of those Buddhas who sit and stare admiringly at their fat stomachs that were filled and satisfied centuries ago! I am only interested in Tomorrow! *The Four Horsemen of the Apocalypse* had its day and fulfilled its purpose. But now I am launching new books—eight of them in a great series—that have a new and greater purpose, and if you like, I will speak of them, but not of the past.'

Señor Ibañez handed me a highly tinted jacketed book bound in paper. It was in Spanish and entitled *El Papa del Mar*. He inscribed it to me, making it a treasured first edition of all editions, being one of the first hundred off any press.

'I am writing history in fiction form. The two will be so closely welded together, that you may not see where one ends and the other begins. It shall be of great interest to America, for it takes first into consideration the mother of America—the *real* mother, who is Spanish —through her period of travail before the child, America, was born. There will be eight



—*Keystone View.*

Vicente Ibanez in the wonderful library of his French villa.

volumes, each depicting, in the form of a romance, one of the great periods of Spain's vital relationships with your continents of America.

'You will not like some things I have to say—you Nord Americans. For instance, after eight years of research, after I have examined all the reliable documents of the period, I am convinced that Christopher Columbus never stepped foot upon—never even saw!—any part of the continent of America! I can prove it.'

HE was challenging us almost fiercely. We had no answer. He continued:

'I begin with the book you have here—*The Popes of the Sea*, it will be called in English. The Pope of the Sea was the Doge of Venice. Next I shall take up the Borgias and call it *The Feet of Venus*. But all the while, mind you, history and romance will be walking through the pages hand in hand. More than that, there will be history of the olden days, knitted together with a romance of our day! Panama, London, America—all worked into the action together. The first books all verge toward the discovery of America.

'No, my friends, Columbus never got to America. He died before he could make the trip. It was Vespucci—Amerigo Vespucci of Seville, who discovered your country! Ah, they all thought they would go to India, but none thought he would discover America.

'You Americans of the North have usurped that title of "American"—you people of the United States. Why, not until the Spanish-American War did we people of Spain even call you people of the United States "Americans."

'My final book of the series will be *The Youth of the World*. That is you—your United States. Ah, you are just beginning—and we are old!'

He must be interested in American motion pictures that had brought him in an immense fortune alone. What did he think of them—for the future, of course?

'The American motion picture has no standard other than workmen and grisettes! That is all I can say.'

In the parlance of the day, Ibañez had 'said a mouthful.' What I was anxious to learn was the exact kind of a revolutionist Ibañez was and the character of his ideas. My impression, and that of all the people I had met, was that he was simply a bolshevist striking at the root of all stabilized government.

'Bolshevist!' I thought he would burst a blood vessel. 'I am not even a socialist! I am a simple republican—just as you in America are republicans. It is not politics that interest me at all—will you not understand? Will the world not understand? *It is Spain that I have in my heart.* In France I would be called a Conservative.

'In Spain, all is wrong. All is corruption. The people are heavily taxed and are squeezed and squeezed—for what? For money and more money for the king, for the army and for the church. All I ask for—and that is why my own people put me in prison and want to kill me!—are schools and freedom and a life this side of beggary for my people—only a little bit like you have in the United States. That is all I ask. But I cannot have it from the king, so I say then the king is a tyrant and we can only get these things if there is a republic. Without the things I ask there is no morality!

'All I want to see in my generation is these great things started. Administration for schools as well as for army and navy. Equal rights for Protestants, and not persecution. Schools for all and progress must follow. We have but a little country. But the church and the army eat up more than the people. Our government has no money for anything outside the Three Great Vicious Interests. We are bankrupt; we haven't a *sou* to meet our budget and don't know where to get the next penny from.

'My idea is simply to instill in the people the facts of their own deficiencies, and then the future will take care of itself. It must be sown and developed or Spain will die of dry rot. No, my friends, I am simply a Spaniard speaking for the welfare of my people—a republican, if you will. But the world has made not a patriot of me, but a demagogue seeking power, a loud mouthing thing, a bolshevist, a—Marie! Marie!' he shouted to a housemaid passing through the hallway, 'bring here the hundred-year-old cognac! I would drink with my friends—to Spain!'

And so we read in the day's press, along with the announcement of *A Novelist's Tour of the World* by Vicente Blasco Ibañez,

SPAIN'S ENTIRE ARMY TO BE REFORMED
Reduction Begun With Artillery
Money Saved Is Expected to Be
Devoted to Long Delayed
Public Education
And Improvement

The first time in history! And without a doubt the first unacknowledged victory of the Battle of the Windmills by that lone latter-day Don Quixote, Vicente Blasco Ibañez.

Overfinancing the Building Boom

(*Concluded from page 2*)

million, another a million and a half and a third is reported to have died from grief over the misfortunes of this tragic enterprise.

There is in a New Jersey suburban town an apartment house which was built at a cost of $600,000. A banking house agreed to finance it with a public bond sale, but it exacted from the builders a bonus of 'fifteen points,' which, in the realty business, means fifteen per cent on the construction cost. This bonus of $90,000 was pledged to the bankers. The latter then started to market the bonds they had underwritten; they sold securities to the amount of $190,000, which sum they turned over to the builders. Then the bond house failed, with a crash that resounded through the country, for it had financed buildings of a like nature in cities in many states. It is regarded as doubtful whether the unfortunate promoters of the building will receive anything more.

A large theater corporation is constructing a building on a plot of land somewhat apart from the section which is crowded nightly with theatergoers, but which is still near enough to obtain their patronage. In other words, the location is well selected, and the prospects for the success of the enterprise are favorable. But the financing of this proposition appears exceptional, to say the least. The corporation has sold first-mortgage bonds through a banking house to the amount of $4,250,000, and it has also issued stock in the form of 475,000 shares of 'no par value,' divided into 125,000 preferred shares and 350,000 common shares. These securities are already said to be widely distributed.

The bonds, when sold, were dated October, 1925, and the theater has not yet been completed. Bearing interest at the rate of 6¼ per cent, these bonds must annually pay a charge of $265,000, and this sum has now been distributed to the security-holders before the completion of the building, for the interest-bearing bonds were marketed before the ground was broken on the building site. Bond and mortgage houses customarily demand a bonus for underwriting securities, aggregating from 6 to 15 per cent. Making a conservative estimate of 8 per cent in this instance, the 'points' paid to the bankers probably amounted to the sum of $340,000.

NOW the preferred stock was marketed by brokers, who offered a bonus of one share of common with each three shares of preferred that were purchased. The preferred stock is to bear cumulative dividends of $3.50 annually, accruing from December 1, 1925. The theater, to all appearances will not be opened for business until nearly a year after this date, so the cumulative dividends, due before the enterprise begins earning returns, amount to $437,500. When the doors of the theater swing open to the public, the corporation which sponsors it will have entered upon its theatrical campaign with an indebtedness already incurred of close upon $1,042,500. This indebtedness works out as follows:

Interest on bonds, at 6¼%, paid before completion of building	$265,000
Bankers' bonus (estimated)	340,000
Accumulated dividends on stock	437,500
Total obligations incurred before business begins	$1,042,500

When bankers who sell securities are compelled to take over the properties on which they are issued, it is not a healthy sign; nor is the situation rendered healthier when real-estate bonds are sold a year or so before the property on which they are a first-mortgage lien is completed. And when furnishings of club houses and hotels are put under a mortgage, it loses its character as a first lien, and becomes a chattel mortgage.

The greatest asset of the country lies in its real estate, and more persons are said to be interested in it than in any other form of property, from the owner of a small dwelling to the corporate owner of the largest industrial plant, hotel or apartment house. In 1925, $675,000,000 worth of real estate bonds were sold, an increase of more than 1,000 per cent in the last five years.

The head of the National Association of Building Owners and Managers said the other day: 'There is something about the purchase of real-estate bonds that is different from other bonds. The fact that one can go into a building and really see it and realize that he is a part owner, even if he has only $500 or $1,000 of the issue, is alluring. But no building is worth more than it can possibly earn over a term of years, even though its door-knobs are gold plated.'

Getting Acquainted With Wildcats

(*Continued from page 13*)

Eyra cat who gives one a hasty glance and bounds away into the dense herbage of its haunts.

he Sierra Madre in Coahuila. The elegant reature had evidently been interested in ny netting of insects, for I turned and ound it observing me intently at a distance nd showing no tendency to retreat until I hortened the space by half. Then it trotted ff like a lazy dog, pausing now nd then in the common feline nanner to look back at me until t disappeared with a bound among he denser bushes, nor could it gain be routed out, although I magined it was watching me from ome shadowed, near recess.

The other experience was with-n a motts or grove of live oaks n Southern Texas. I chanced to glance up just before passing nderneath a horizontal limb not ive feet above my head and there eheld what, to a naturalist, is a nost entrancing sight: one of our eemingly formidable wildcats, and he most beautiful, at rest within ts haunts.

Such creatures well know their nereditary enemies, if they do not correctly judge individuals. I was greeted with an open-mouthed snarl and that forceful exhalation of breath by which all cats convey natred and dire warning. In this case, however, it was pure bluff; neither of us intended harm to the other. There must be some-thing lacking in the man who could turn his rifle upon a creature so vitally appealing. After cen-suring myself for having left a note-book in camp and being thus de-prived of making a unique sketch I began to address some words in a soothing tone to this rather over-sized 'kitty' and with the first sound of the human voice the creature leaped to the ground and fled into the bordering thicket. The ocelot has been called docile and been accused of lacking spirit.

I knew of a Mexican goat herder who, to save an injured kid in his hut from what he believed was a coyote, entered club in hand, barring the way out. The culprit was an ocelot and it attacked the man with such persistence that before he could give it a stunning blow it had clawed and bitten his arm so that amputation was necessary.

The artist came face to face with this fellow in Texas. The stout-bodied ocelot is perhaps the most beautiful of American wildcats.

Not least in interest are the short-tailed, ear-tufted lynxes of which, in North America, we have two well-defined species that, like all others of our wildcats, are too little known: The Canada lynx, called also by the Canadians with incomprehensible inaccuracy, *'loup garou,'* is a long and heavy-limbed animal with very large feet, necessi-tated by its travels in deep snow. Its pelt is valuable because of the long, thick fur and hair of silvery yellow with darker pencilings. Its range is the northern por-tions of North America and south as far as the upper tier of heavily forested states.

The bay lynx, known also as bobcat because of its short tail, is our commonest wildcat, also so called. It is most widely and generally distributed in the United States, inhabiting also the highlands of Mexico. Concerning the numerous pub-lished accounts of this creature and its northern relative there is much misunder-standing, error and lack of accurate data. Nelson states that the Canada lynx is one-third larger, weighing as much as thirty pounds. Hornaday quotes the account of a bobcat weighing fifty-one pounds and Sass records a South Carolina low-country cat at the same figure, further stating that thirty-pound bobcats are not rare in that country. If, then, the weight of the Canada lynx has been correctly given, it is smaller than the bay lynx, but probably really averages larger.

The geographic varieties of the bay lynx differ considerably, as do those of most animals of wide distribution. The southwestern bobcat is a gray and dark-spotted animal with very little tan or rufous, hardly de-serving the name of bay lynx. The Eastern United States form is so like the red fox in general coloration that at a distance it is not always easy to tell one from the other until the tail is noted. The lynx has a habit of wagging his stump when excited or angry. Reynard's long, heavy brush is almost the biggest part of him. The rich coat of rufous all over the upper part of the eastern bay lynx might make it a handsome crea-ture were it not for its rather un-gainly build, with hind legs too long, body and tail too short.

The bobcat, though sharing with the others of its generic relatives most of the feline char-acteristics, differs from them in being a nest builder. Its cousin of Canada finds shelter among dense spruce and fir; the puma selects retreats naturally leaf-carpeted. Those cats of the warm countries commonly need no spe-cial bedding and the rapid growth of vermin compels them frequently to change their quarters. But the bay lynx has, like the skunk, developed the habit of gathering material with which to make its kittens more cozy and comfort-able.

I have spent much time prying into the habits of the wildcat; there are more patience and per-sistence required than when an-gling. But it is sometimes worth all the trouble, even where the

shy animals are so scarce as not to have their presence known by the farmers and woodsmen. Interference will compel the mother cat to remove her kittens, carrying them after the manner of domestic puss—by the back of the neck.

One retreat I found by accident while seeking a vireo's nest. The young ones were able to follow the mother about and evidently returned to this lair each day. I caught the barest glimpse of the parent and one quarter-grown kitten scrambling up a fallen tree limb to the den in the rocks. The next day I found dead grasses, leaves and much fur placed in such a manner on a sheltered ledge as to make it certain that the kittens had been carried there after preparation. When a boy, in Tennessee, my chum and I discovered the kittens peeping from a rocky crevice that we did not care to reach, though the mother cat was away. Much later we returned and found a nest similar to that described above.

But at best one gets only a brief glimpse of the wildcat, unless in cruel traps or after the creature has been shot. Though having had numerous opportunities with gun in hand, I am glad that I have never killed a wildcat. Why destroy them? They do very little injury; if poultry, lambs and pigs are properly housed or penned the cats and foxes will take it out in destroying field mice and reptiles. Grouse and partridges escape by cunning and subterfuge; wild turkeys and rabbits are most plentiful where bobcats are commonest. It is unsafe to interfere with the balance of nature between predatory creatures and their natural, vegetation-destroying prey. Besides, to the nature lover there is a charm, a thrill in catching a glimpse of a sizable feline now and then and in knowing that the wide, yellow, curious, malevolent eyes may be watching in these hidden recesses. Possibly the cat is treading softly after him.

MANY foolish things have been asserted concerning the hunting of our wildcats, mostly to extol the powers of the beasts and then to magnify the powers of our friend the dog. Fenimore Cooper gives a ridiculous account of an old dog that for a time kept a puma from attacking two helpless girls. James Lane Allen makes his hero, without a gun, kill a puma that attacked him. Sass, who writes with convincing charm, oversteps the bounds of common sense by evidently believing and relating some old braggart's account of a noble hound's having, singly, killed a bobcat by crushing its breast with jaws and weight. This would be as impossible as to scare the little beast to death; its sternal bones are not of such fragile stuff and what, pray, were the feline claws, both fore and hind, doing while the dog was thus deliberately employed? There would have been nothing but bloody shreds left of the canine face, ears, eyes, sensitive nose and belly and not even a fighting bull terrier could have survived. But there is no mention of the claws; the cat merely bit the dog through the shoulder, though pinioned as it was it could not possibly have reached this part of the aggressor.

Once, while coon hunting, I mistook a small wildcat for *Procyon lotor*, climbed up and shook it out of a tree and it fell over fifty feet, quickly whipped three powerful dogs any one of which could kill a raccoon and rapidly got away from its human enemies to a pile of rocks two hundred yards up a steep mountainside.

The World Tells Its Tale of 1926

(*Continued from page 5*)

occupy the territory. Since then efforts have been made to settle the matter by negotiation. On the same day Premier Briand ended his ninth ministry, again reorganized his cabinet and began his tenth premiership June 23.

The International Eucharistic Congress, honored by the presence of twelve cardinals, princes of the Roman Catholic Church, met in Chicago June 20 to 24.

Aimee Semple McPherson of Angelus Temple, Los Angeles, who vanished at the beach at Santa Monica, California, reappeared June 23 at Douglas, Arizona, having escaped, she said, from kidnappers who had brought her from the California beach to a deserted cabin in Mexico. In Italy, on June 29, new industrial laws were proclaimed, restoring the nine-hour working day, forbidding strikes, and limiting the size and contents of newspapers.

Early this year it transpired that the Canadian Government was being defrauded of millions of her revenue. Instead of using the fact as an argument against the tariff the opposition used it to overthrow the government of Mackenzie King, Liberal premier, who was defeated on a test vote in the House of Commons and presented his resignation to the Governor-General

On July 3 Congress adjourned, having done little in its last few weeks except to discuss farm-relief measures, rivers and harbors appropriations and similar measures without taking action. On July 6 President Coolidge and his family sought rest and recreation in a camp in the Adirondacks, near Paul Smith's, New York.

The grand jury at Los Angeles heard evidence in regard to the alleged kidnapping of Mrs. Aimee Semple McPherson, but returned no indictments.

In answer to criticisms in Europe that the war-debt settlements with America were oppressive, Secretary of the Treasury Mellon stated, on July 17, that most of the war indebtedness had, in one way and another, been remitted, and that all the debit countries were expected to repay were advances for other than military purposes. This was at variance with what he had previously stated. Failing to redeem French finances from their distressful state Premier Briand resigned his tenth premiership July 19. Edouard Herriot's ministry lasted two days. Conditions were desperate. The French franc had fallen to a value of about three cents in American money. On July 23 Raymond Poincaré induced five other former premiers to join him and confidence in this new cabinet was voted on July 27. Since then the affairs of France have taken an upward turn.

Governor Miriam A. Ferguson, of Texas, sought renomination for the post. Her opponent, Dan W. Moody, attorney-general, received a plurality at the election of July 24. In Texas primaries a majority of all votes cast is necessary for nomination, so a 'run-off' was held August 28, Mrs. Ferguson being decisively defeated.

After many months of bitter dispute President Calles, of Mexico, declared his intent to put into effect on August 1 the church laws requiring priests to register, denying aliens the right of conducting religious services and imposing other restrictions on religious organizations. The bishops of the Catholic Church refused to recognize or obey these laws and announced that when they went into effect they would suspend the services and sacraments of the church. On July 31, therefore, the Catholic priests of Mexico left their places and their congregations without spiritual ministrations.

Gertrude Ederle, of New York, swam the English Channel on August 6, being the first woman to accomplish that feat. She anticipated a profitable stage career on the strength of the feat but two days after she was received at home with great éclat Mrs. Clemington Carson, also of New York, did the same thing and before a month had passed a German, a Frenchman and an Englishman duplicated the performance.

The state of New Jersey, prodded into action by a New York newspaper, reopened the old Hall-Mills murder mystery. In 1922 the Reverend E. W. Hall, of New Brunswick, and Mrs. Eleanor Mills, choir singer, were found murdered near that city. The authorities took no definite action until 1926. Mrs. Frances Stevens Hall, widow of the murdered man, was arrested July 28 and within a few days her brothers, William and Henry Stevens, and her brother-in-law, Henry Deb. Carpenter, were placed in jail. The first three defendants were placed on trial November 3 in the presence of 200 newspaper reporters. One telegraph company had 28 operators on the scene and ten press photographers were admitted to the court room. The trial lasted one month and resulted in acquittal for the defendants.

Charles W. Eliot, president emeritus of Harvard University and one of the foremost educators of all time, died on August 22. Rudolph Valentino, motion picture actor, died the following day.

On September 6, the Assembly of the League of Nations met and continued where it had left off in March. In the interim some of the difficulties had been ironed out. Spain was still obdurate. When Germany was voted in on September 8, Spain resigned. A compromise was reached on the matter of membership in the Council, its number being increased to fourteen and several countries being elected to two- and three-year terms, instead of one. The

ssembly transacted little other business of nuch importance.

Mrs. McPherson again came into the melight in September. The charge was nade that she committed perjury in telling er story to the grand jury. The preliminary earing lasted until November 3, when she vas held for formal trial.

Captain René Fonck, noted French var 'ace,' attempted to fly from New York o Paris on September 21. Preliminary test ights had been deemed satisfactory, but he actual attempt ended in tragedy. The iant plane burst into flames before it left he ground, and two men, a Frenchman and Russian, were killed. Captain Fonck was ot injured.

On September 18 storms of unprecdented velocity struck Miami and other Eastern Florida cities. The death list is fficially placed at 368. Property damage vas enormous. Great suffering and hardhip followed the storm and the American Red Cross, with other agencies, rushed aid o the sufferers. As soon as Florida recovered rom the first shock she set to work to reair the damage and to minimize the reorts of their extent, which the governor of he state and the mayor of Miami declared ad been exaggerated.

On October 1, John Barton Payne, President of the Red Cross, issued a formal tatement in which he said that the attitude f these officials impeded the gathering of unds for relief work.

Canada emerged from a complicated olitical situation in September with the Liberal Party restored to power and Macenzie King again premier. Early in the ear a scandal broke out regarding smuggling, and a vote of censure for the Mackenie King ministry was believed imminent. Mackenzie King asked Baron Byng, Governor-General of Canada, to dissolve Parliament and call for a new election. This Baron Byng refused to do, and Mackenzie King resigned.

Arthur Meighen, leader of the Conservative Party, was then called upon to form a ministry. He soon received an adverse vote from Parliament and a new election was called. Meighen's ministry served throughout the summer, but resigned in September when the voters swept the Liberals back into power. The Liberals did not have a clear-cut majority but were able to form a ministry with the aid of Independents and the Progressive Party.

Oct.

Queen Marie of Rumania, with her son, Prince Nicholas, and her daughter, Princess Ileana, arrived at New York October 18 and began their tour of the United States.

On October 25 the Supreme Court of the United States made a ruling greatly extending and confirming the right of the President to remove, without consulting the Senate, federal officeholders whose appointment requires Senate confirmation. As the month closed the bootleg gangs in Williamson County, Illinois, in and around Herrin, became active again, using machine guns and bombs.

Mussolini was again fired upon. The youth who shot at the Dictator was literally torn to pieces by the infuriated populace.

Nov.

The Congressional and state elections on November 2 left the House of Representatives in control of the Republicans, with a reduced, but working, majority.

On November 19, international bankers issued a sweeping manifesto calling upon the nations of Europe to tear down tariff and trade barriers. The American signers as well as the Secretary of the Treasury explained that it had no reference to this country.

Britain took an important step when the premiers of Canada, Australia, New Zealand, South America and Newfoundland and the president of the Irish Free State foregathered with Premier Baldwin in London and defined a new status for the British Commonwealth of Nations. Hereafter these dominions will be known as 'autonomous communities within the British Empire, equal in status and in no way subordinate one to the other in any aspect of their domestic or external affairs.'

On November 4 United States Judge George W. English, of Illinois, impeached by the House in April, resigned, thus making a formal trial by the Senate unnecessary. On November 5 President Coolidge announced that the Administration desired to make a tax refund from the revenue surplus for the year.

Dec.

December opened with China in a turbulent position, with Cantonese revolutionists marching on Peking. The nominal government of China had further complicated matters by denying Belgium the special privileges that nation, along with other foreign countries, had enjoyed for many years.

In France the Berenger-Mellon debt settlement was about to come up for discussion and possible action in the Chamber of Deputies. Trouble with Mexico was indicated by Secretary of State Kellogg's sharp note regarding the Mexican land laws. It was widely intimated that Mexican 'reds' had been aiding the revolution in Nicaragua. Russia appeared to be inclining toward the 'right,' with Stalin firmly in the saddle, and Trotsky and Zinovieff in the discard.

On December 11 President Adolfo Diaz of Nicaragua issued a manifesto in which he renewed his accusations that the Mexican Government was actively supporting the Liberal revolutionary movement in his country. He charged that reliable information indicated that officials of the Mexican Government were outfitting a vessel which, with an armed expedition, would proceed soon to Nicaragua, under the escort of Mexican gunboats, to make war against the government. Asserting that successful Mexican interference in the Government of Nicaragua would mean the confiscating of private property, the denial of religious freedom, communism and political disorder, President Diaz called upon the Liberal revolutionists to make peace with his government.

Storms on the Sun

(*Concluded from page 7*)

It is these disturbances that produce what are popularly known as sun spots. When Galileo perceived sun spots through his little telescope he was regarded as a dangerous man who was corrupting the world by finding blemishes on the sun.

While the general cause of sun spots is almost certainly the high temperature of the sun, and the great rate at which it radiates heat into space, there are many things about them that are quite unexplained. The first of these is their approximate periodicity, with a period of eleven years, which I have already mentioned. The second is that they appear only in two bands on each side of the solar equator, extending from a latitude of 10 degrees to one of 40 degrees, both north and south of the equator. The storms are, on the average, more numerous and of larger extent in the southern hemisphere of the sun than they are in the northern.

A question of wide general interest is the possible effects of sun storms upon the earth. It may be stated at once that they do not change the total quantity of the sun's radiation to an important degree. The character of the radiation is, however, a little modified.

The most commonly observed of these phenomena is the *aurora borealis*, or northern lights, which are probably induced by solar disturbances. They are most frequent when sun spots occur in greatest numbers.

A related phenomenon is the magnetic disturbance that frequently occurs when there are sun spots.

Statistical studies of the question, extending over many years, seem to indicate that the weather has a slight periodicity corresponding to the sun-spot period, but the matter is generally regarded as being somewhat in doubt. At any rate, it is certain that the sun spots have no very marked effects upon the earth.

Strikingly as the sun and the earth differ in appearance and organization, they are blood relatives, so to speak.

It is now known beyond any question that there are present in the sun, in enormous quantities, such well-known elements as hydrogen, carbon, oxygen, sodium, calcium, iron, nickel, copper, and zinc; indeed, nearly all the elements found on the earth exist also in the sun, except a few of the heaviest.

There was one element found in the sun which up to that time was not known on the earth. It was therefore called *helium*, from the Greek word *helios*, meaning 'sun.' This element, which is a gas, was subsequently discovered on the earth. Owing to its being non-combustible and lighter than air, it is ideally suited for use in airships.

Digging *into* Past History

By WILLIAM A. McGARRY

ARCHEOLOGY has been recognized in modern times for not more than one hundred years, although there is evidence to show that it was practiced by certain scholars and rulers long prior to the Christian Era. Until the beginning of the present century only a dim outline had been obtained of the ancient greatness of the country now familiarly known as Babylonia.

All that was known before was in the historical references of Berosus, a Greek writer of the third century before Christ, who compiled a mixture of fact and myth, basing much of what he wrote on records of Nabonidus, a Babylonian king who lived two centuries earlier, the father of Belshazzar. It was known that Nabonidus had compiled a list of kings and dynasties back to the beginning of Babylonian history, but even in the time of Berosus it had been lost. The Greek writer was able only to note that the Babylonians estimated some thirty-two thousand years had elapsed since the Deluge, prior to which they believed there had been a high state of civilization in their country for nearly half a million years.

More than two thousand years elapsed after Berosus before the world got any real confirmation of his writings. Then the French at Susa and the British at the palace of Asurbanipul in Assyria began to dig up records of the Babylonians. Tablets were found containing many records, including the Code of Hammurabi, the great lawgiver who compiled the laws of Babylonia. Then, about the time of the University Museum expedition to Nippur, the most ambitious piece of excavation up to that time, tablets began to find their way into the hands of scholars which bore two sets of inscriptions. The characters were the same—the peculiar wedge-shaped marks—but all that had been learned about reading Babylonian was of no avail in reading the new language.

A CONTROVERSY arose concerning it, some archeologists contending that it was meaningless. Then thousands of the tablets were discovered at Nippur, and finally scholars succeeded in proving that the mysterious new language was really a form more ancient than the later Babylonian. It was the language of Sumer.

Now, after more than a quarter of a century of difficult work by English, French, German and American scholars, it is known that the Sumerians were a non-Semitic race and apparently the first settlers of the Mesopotamian plain. Just when the race became extinct is still a matter of conjecture, but by 2200 B. C., the Semites were in virtually complete control of the land. Their accession to power was a slow growth that was not completed for many centuries, and in the view of some scientists was made possible through the inability of the Sumerians to withstand the rigors of the hot, dry climate. At any rate, the Babylonians took over the culture and civilization that they found in the country.

The first Semite settlements were in the north, those of the Sumerians in the south. The land to the north was known as Akkad. Sumerian was retained for thousands of years as the official language. All the ancient religious services including psalms and liturgies were kept in Sumerian script. Then, as the Babylonians increased their control, the scribes made records of famous epic poems in both languages in parallel columns on the same tablets, which were then used in the priest school at Nippur. At that time, of course, relatively few of the population ever learned to read and write. All documents were prepared by the scribes and all written records were kept in the temple archives.

IT HAS taken many years to make even a partial translation of the twenty-five thousand tablets brought home by the University of Philadelphia Museum expedition from Nippur. In a previous article describing the work of Dr. Leon Legrain, now curator of the museum's Babylonian section, some idea was given of the difficulty of the work and also of the more important discoveries made by him. Prior to his arrival in this country other translators had found records giving them nearly all the names of kings and dynasties back to 2000 B. C.

He found tablet fragments, broken perhaps four thousand years ago, put them together and got successive lists furnishing the names of all dynasties known to the Babylonians who lived in that year or as early as 2500 B. C. By calculating months instead of years where the Babylonian chronologist ascribed reigns of 18,000 years and similarly long periods to certain kings, he has been able to construct the framework of the country's history back to approximately 5000 B. C.

From the religious point of view all Christendom is interested in Ur of the Chaldees in Mesopotamia because the place was the home of Abraham before Thare, his father, led him into the Land of Canaan. Apparently Ur of the Chaldees was a large province, the city being the capital or county seat. It was also the center of moon god worship, and for thousands of years conquering kings brought their loot to the temple there as sacrifice to the God Sin, and set up inscriptions describing their campaigns.

In its earliest days Ur was located on the banks of the Persian Gulf, at the junction of the Tigris and the Euphrates. Since then those streams have carried down millions of tons of silt until the shore line has been pushed outward more than a hundred miles. That fact made it difficult to discover the exact location. It should be stated that the only outward signs of Mesopotamia's forgotten cities are huge mounds of sand, rising from the flat plain. No one has counted all the mounds as yet, but archeologists say there are hundreds of them, rising as high as a hundred feet above the desert.

When all of those cities were thickly populated the country was the most productive the world has ever known. It made agricultural records that have never been equaled. All the towns were connected by canals, which are still recognized as engineering marvels. So thoroughly were they constructed that although the beds have long since gone dry, the banks of most of them are still intact and could be used again, with little repairing, for the purpose for which they were built thousands of years ago.

Since the records at Nippur and other strictly Babylonian cities show that the original culture came from Sumer in the south, it follows that archeologists have turned longing eyes toward the southern settlements. Before the war, however, exploration was surrounded with difficulties. The Turks were then in control. They issued permits to recognized archeologists or to almost anybody else who would agree to leave half his finds at the museum in Constantinople. Then they decided on what constituted half. The archeologist worked presumably under the protection of the government, but that was uncertain, and he was subject to all sorts of trouble from wandering bands of Arabs. Under those circumstances it was impossible to get funds for systematic excavation.

Wars were frequent in early Sumerian and Babylonian times. Originally each community set up its own government. Then, as the arts and sciences progressed, men became ambitious for more power. A system of city kings was evolved. Sometimes there were several dynasties all operating at once, and each controlling a section of the country including many cities. Even in times as late as these of Darius the Persian conqueror it was the custom of the invader to tear down the wall that his predecessor had built around his city, and to destroy the public buildings.

SOMETIMES it is evident that cities were deserted for a century or more, but always the descendants of the original inhabitants returned and started to rebuild. Old ruins were simply leveled over or filled up. A pavement was put down of sun-dried bricks, each bearing

the name stamped into it of the new ruler. That habit furnishes an infallible record of time to the explorer.

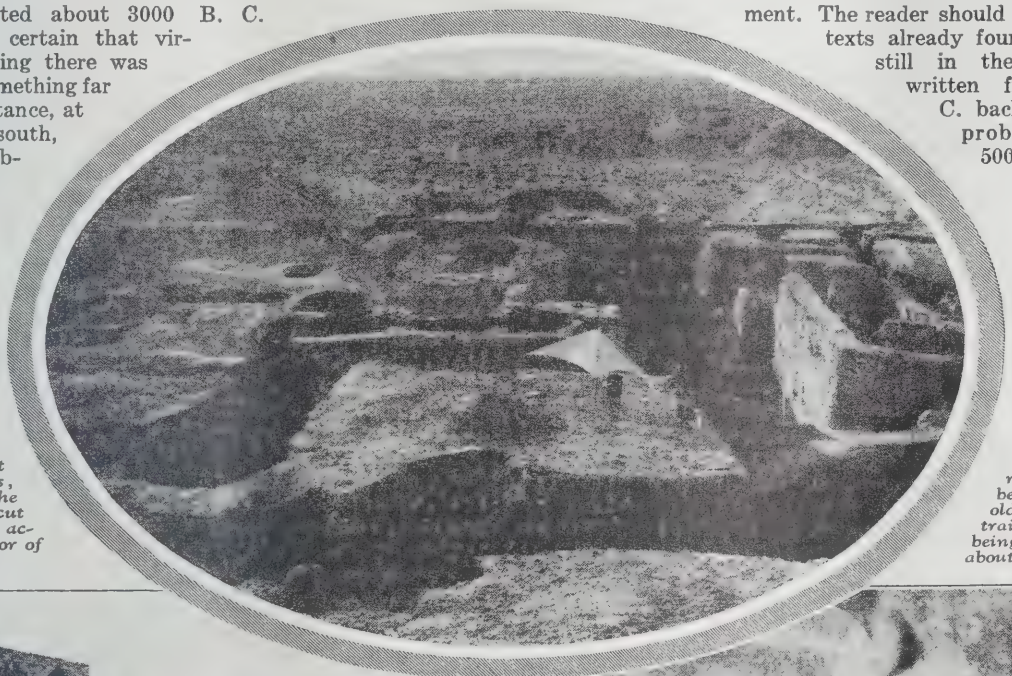
Nippur had twenty-one different occupations during its troublous history. Ur may have had forty. At Nippur was found the earliest known story of Creation, Paradise, the Flood and the Fall of Man, to say nothing of countless religious records bearing marked similarity to the fundamental doctrines of Christianity. The translations of those tablets were made by Dr. Stephen H. Langdon, a native of Michigan, now Professor of Assyriology at Oxford University, England, when he was curator at the museum in Philadelphia. According to the Sumerian version, it was Noah, and not Adam, who ate the forbidden fruit, and the Deluge brought an end to Paradise and incidentally to thousands of the populace.

The earliest of the tablets found at Nippur is dated about 3000 B. C. Scientists are certain that virtually everything there was copied from something far older. For instance, at Lagash, in the south, was found a tablet of stone containing an inscription fixing the boundaries between that city and Ur. The form of writing used is the most archaic known of the wedge-shaped system. It is, in fact, a collection of pictographs. One authority has estimated the date of that tablet as 4500 B. C. Another tablet almost as old contained an inscription describing a magical method for ridding a field of a plague of locusts.

The fact that stone was used is highly important. It is evident that although it was scarce in Sumer, it furnished the only means of making records for many thousands of years before some inventive genius hit on the idea of using clay. A whole library of archaic stone tablets may be found down in the lower levels of occupation at Ur of the Chaldees, and if so no one can tell how far back history may be carried and what revelations may be made of the early struggles of mankind. In that library will be an earlier story than any now known of Creation, Paradise, and the Deluge.

Among the eleven royal cities, seats of dynasties, known to have ruled more or less completely the land of Sumer and Akkad, from the Persian Gulf to the actual region of Bagdad, and even to the Mediterranean Sea, between 4000 and 2000 B. C., Ur had three times the honor of leadership. These eleven cities fall naturally into two groups; north and south, Akkadian and Sumerian, two different races and languages. The Akkadians were Semites.

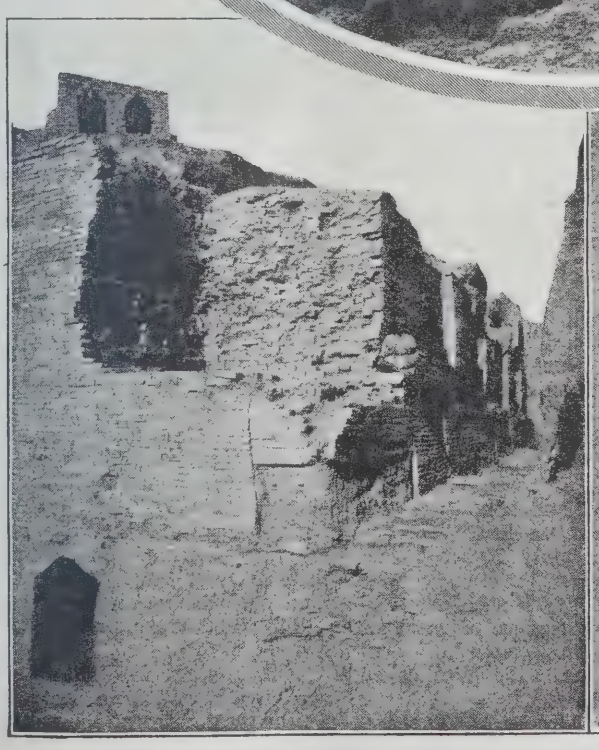
Exploration at Ur has yielded a text left by King Nabonidus containing a prayer for his son. Nabonidus rebuilt the temple of the moon god. He left other inscriptions there describing the conquest of Palestine referred to in the Old Testament. The reader should note that the texts already found and those still in the ruins were written from 500 B. C. back to a date probably beyond 5000 B. C.



General view of the Nippur ruins.

Sun-dried brick walls, twelve feet in thickness, through which the explorers had to cut in order to find access to the interior of the building.

Bas-relief of a royal personage, being one of the oldest known portraits of a human being, dating from about 2300 B. C.



CHATS WITH OFFICE CALLERS

This is a tale of travel. Because, obviously, a man can't sit Buddha-like all the time, listening to those invested with the attributes of prophecy, those dull with didacticism, those full of critical contempt and those resolved to talk resolutely upon their own subjects. There's what may be called a Beowulf attitude, when a man goes about to see and to hear. And this is the tale of what befell between Detroit and Montreal on the train.

Chance acquaintances fell into a discussion touching the probable origin of oil because ***a Man from Beaumont, Texas,*** told of a new deep well drilling and fifty new derricks on Spindle Top, and a still deeper drilling in process by which it was expected to touch another vein or pool. Then ***the Montreal Man*** drew an imaginary picture of a watery world with sea monsters dying through a million years to the end that we of today might travel in automobiles. 'I run my car,' he said, in pleasing fancy, 'from Montreal to Nipissing, and in effect use up the product of a whale which swam in pre-glacial seas.' But the Beaumont man held that it was not reasonable to think that oil, the present production of which from the Beaumont field alone was 100,000 barrels daily, could have animal origin. His guess was that a vegetable origin was nearer truth. 'But anyway,' said he, 'guessing is missing,' as the Mexicans say.

* * *

Then the talk slid, somehow, into a groove concerning strange discoveries, queer things seen and odd things collected. ***The Quebec Physician*** told of several volumes in the library of the Philadelphia hospital, given by a Mr. Stockton-Hough, all of which were bound in human skin. Then the French gentleman who had been to the Clements Library and seen historical wonders, said that he had seen a book, owned by the family of the former Prince of Ligne, which was neither written nor printed, for each letter had been cut from a tree leaf and pasted on paper. So others told of strange collections, of people with a taste for well-shaped bottles, for walking canes, for first numbers of magazines, for dolls, for anything and everything under the sun.

* * *

'If you talk of interesting collections,' said ***a Man from Orange, New Jersey,*** 'consider that of Wilbur Macy Stone. He has the most unique collection of miniature books in the world, some of them so small that when they are fitted into specially prepared cases the box holding them is not larger than a special delivery postage stamp. And his wife has a collection of silver perfume cases, such as were used in the 18th Century.'

Then a man with a quick and observant eye, who turned out to be ***an Importer of Curiosities,*** assured us that he was on his way to a place near Vichy, France, to see what could be picked up. For significant things had been found there, he said; bricks, for example, of extreme antiquity, which bore inscriptions with signs resembling letters of our alphabet. The indications were that those who inhabited Europe, around 4000 B. C., were more cultured than we had credited them with having been. There were also engravings on stones of animals and of letters; also, what seemed to be the débris of a glass factory, very ancient indeed.

* * *

'And so,' said a tall and melancholy looking gentleman who told us that he was ***a Psychiatrist,*** 'with each discovery we push back the curtains of ignorance to find intelligence of a high order. When men lived in caves they carved tusks and etched pictures with more skill than some of us can command today.'

At that, there spoke up a man who had said nothing thus far, an unassuming kind of fellow who sat on the edge of the washstand, the seats in the smoker being comfortably full. 'Was the world ever inhabited by cave men?' he asked.

'Of course it was,' declared the Psychiatrist, then began somewhat in the manner of a lecturing professor, 'The caves from which we gain our idea of Mousterian culture—'

* * *

The Man on the Washstand interrupted with: 'Pardon. I meant to say that when we talk about cave men, we do so rather loosely, much as we might talk about Europeans, or mountaineers. Sweepingly, so to speak. Now I'm only a mechanical worker, you see, so not eligible as a theory builder. But it has always seemed to me that if the world held any considerable population of cave men, there would be hardly enough caves to go around, so to speak. There'd be a sort of housing shortage. So why shouldn't we assume that caves were somewhat in the way of storehouses, fireproof places in which rarities might be kept. Primitive museums, in a word. One guess is as good as another.'

At that the Psychiatrist shook his head in a dismissing way and cleared his throat for further speech. He had a fine baritone voice and an impressive manner, and was one of the sort to command attention, being oracular. So he slighted the man on the washstand and went on to tell us that the Vichy discoveries were just what he had expected, exactly what he had predicted once, with his wife for audience. Indeed he referred us to that lady by way of confirmation. For there had been, he said, similar discoveries made in Portugal, in the year 1904, at a place called Traz-oz-Montes, where inscribed bricks had been found, stone arrows too of the Neolithic age, wherefore he judged it proper to set the date of the bricks at 10,000 years ago. But there had been finds still more ancient, as when his friend, M. Piette, thirty years ago, found in the caves of Mas d'Axil bricks and stones with alphabetic signs, especially marks like the letters A, E, I, M, and L, and the date of their origin, judging from the stone arrowheads, was most certainly 10,000 B. C. 'As I say,' he repeated, seemingly very pleased with himself, 'with each new discovery we push back the curtains of ignorance to find intelligence of a high order.'

'But how do you locate the date?' asked the man on the washstand.

'There were the bricks, and there, *in situ*, were Neolithic arrowheads,' answered the Psychiatrist. 'Had the arrowheads been Paleolithic, we would have determined the date of the bricks to have been still older. Had we found, let us say, a ballista as used between the armies of Vitellius and Vespasian, we would have been justified in placing the date about A. D. 69. The method is simplicity itself.'

'I see. I see,' said the man on the washstand. 'And if you had found a fossil dinosaur egg there you would have placed the date at a million years ago,' whereat someone laughed, then tried to pretend he had coughed, noticing that the Psychiatrist was registering impatience, as the motion picture producers say.

* * *

'That is not intelligent criticism,' said ***the Professor*** somewhat sharply.

'But suppose those things were carried there?' persisted the man on the washstand. 'They might have been. There are all kinds of unexplained things, you know. For instance, long before Caesar's time there were tin works and gold mines in Britain. And old Caledonian crosses. And Saint Patrick, where did he get that name? From Rome? And a dozen medieval references to Ireland and Scotland before Caesar or Augustine . . . Unexplained things which theories don't fit. As to your finds, put it this way. Suppose my little workshop burned down today. It happens to be a light building of wood which would go up in a flash with all that grease and oil. Now in it I have a couple of pieces of Inca pottery which I picked up in South America. Some arrowheads too, besides other things. Well, suppose a hundred years after the workshop fire, when the place had been covered with débris, perhaps built over —suppose someone dug there and found those Peruvian fragments and the arrowheads, so built up a pretty theory of an ancient civilization near Hammond, Indiana. How about that? As for your Neolithic and Paleolithic divisions of time, that's all fanciful, take it from me. I've lived with primitive people and know that there are workmen skilled and workmen whose fingers are all thumbs, as the saying goes.

'Then there were specialists among natives, some making arrows and doing nothing else; some hunters; some carriers; some just bums and loafers. Man's man everywhere and always. Then there'd be learners of arrow making with all sorts of clumsy attempts which couldn't be destroyed. But down comes your theorist saying "Ha! A clumsily made arrow, therefore belonging to an age when men were clumsy. Evidence of evolution in art," and all that kind of thing, which is nonsense. Wouldn't you call the man a fool who, looking at a roughly built country barn and then at a dwelling house, would propound a learned theory of the barn being of great antiquity because of its crudeness of workmanship, and the dwelling belonging to a later age because of its finished workmanship? Yet that is exactly what the theorists do.'

'That is not intelligent criticism,' said the Psychiatrist, with scorn in his voice. So the matter dropped, because the learned man went into the other part of the car with contempt registered in his very step.

CAN YOU TELL ME?

QUESTION: Was Sam Houston ever im-eached from the governor's office (Texas) id why?

ANSWER: In 1859 Sam Houston was ected Governor of Texas and tried to event the secession of his state; upon his fusal in March, 1861, to swear allegiance the Confederacy, he was declared de-osed.

QUESTION: Why is one of Queen Marie's ughters in exile?

ANSWER: Elizabeth, eldest daughter of e King and Queen of Rumania, was arried to George, King of Greece, who was ter deposed and banished from Greece ith his queen.

QUESTION: Is there a ruling by President oolidge, or the Postmaster-General, that l postmasters must not take an active irt in primaries or elections—national, ate, or municipal? Where can a copy of is ruling be obtained?

ANSWER: Sec. 312 of Federal Corrupt ractices Act, 1925, approved February 8, 1925, reads as follows:

'Section 118 of the Act entitled "An ct to codify, revise, and amend the penal ws of the United States," approved [arch 4, 1909, is amended to read as llows: "Sec. 118. It is unlawful for any enator or Representative in, or Delegate Resident Commissioner to, Congress, or ny candidate for, or individual elected as, enator, Representative, Delegate, or Resi-ent Commissioner, or any officer or em-loyee of the United States, or any person eceiving any salary or compensation for ervices from money derived from the reasury of the United States, to directly r indirectly solicit, receive, or be in any anner concerned in soliciting or receiving, ny assessment, subscription, or contribu-on for any political purpose whatever, rom any other such officer, employee, r person."'

A copy of this act may be obtained by riting to the Superintendent of Docu-ents, Washington, D. C.

QUESTION: Where was General Wade Hampton born and did his brother also erve in the Southern Army?

ANSWER: Hampton Wade was born in Columbia, South Carolina, March 28, 1818. No record of a brother but son died in attle, during the Civil War.

QUESTION: Please state the number of nembers in the chief religious denominations n the United States.

ANSWER: The Federal Council of Churches made the following estimates in 923: Roman Catholic, 18,260,793; Metho-list, 8,433,268; Baptist, 8,189,448; Presby-erian, 2,509,413; Lutheran, 2,465,841; Disciples of Christ, 1,383,247; Episcopal, ,128,859; Congregational, 857,846; Re-formed, 532,700; Mormons, 616,417; East-rn Orthodox, 518,354; Evangelical, 508,-139; Jewish, 400,000; United Brethren, 374,762; and others, making a total of 48,224,014.

QUESTION: What connection is there, or to what extent does the Federal Reserve System control the Federal Farm Loan Bank?

ANSWER: Officially the Federal Farm Loan Bank has no connection with the Federal Reserve System, each having been created by separate acts of Congress. However, the Federal Reserve Banks may—

—rediscount paper for Intermediate Credit banks

—buy and sell bonds of Farm Loan banks

—act as depositaries and fiscal agents for Intermediate Credit banks and agricultural credit associations;

the Farm Loan banks may—

—deposit their funds and securities with the Federal Reserve banks subject to check.

QUESTION: Where is the Mason and Dixon Line located and by whom was it named?

ANSWER: Mason and Dixon's Line is the boundary line between the states of Maryland and Pennsylvania as run by two English surveyors, Charles Mason and Jeremiah Dixon during the years 1763-67 and popularly regarded prior to the Civil War as the dividing line between the free states and the slave states. Between 1901 and 1903 a resurvey was made by the states of Maryland and Pennsylvania.

QUESTION: Is the Grandfather Clause, a law used by the South after the Civil War to keep the negroes from voting, still in effect?

ANSWER: The real 'grandfather clauses,' basing the right to vote on descent from a voter, have existed only in North Carolina, Louisiana, Georgia, and Oklahoma. In the first three states the clauses have expired by self-limitation. In Oklahoma the intention was to make the clause permanent but this intention was defeated by the decision of the United States Supreme Court in 1914, declaring such a clause to be in conflict with the Fifteenth Amendment.

QUESTION: What became of the Aswell Registration Bill in the last Congress? Did it come to a vote and who voted against it?

ANSWER: The Aswell bill did not come to a vote in the last Congress, and there have been no hearings on it as yet.

In this department we shall do our best to answer questions concerning Government and kindred matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

QUESTION: How long is a person who made out an affidavit for an emigrant responsible?

ANSWER: Affidavits are not binding upon the person subscribing to them, and the person preparing such affidavit is not legally responsible for the maintenance of the immigrant on whose behalf it was prepared.

QUESTION: Has the Government ever made a survey to determine whether the men inoculated for the prevention of smallpox and typhoid have developed more resistance to other diseases and whether they are more immune from diseases other than typhoid fever or smallpox than men who have not been inoculated?

ANSWER: The United States Government has never conducted any experiments along this line. The general impression is that inoculations for prevention of smallpox and typhoid fever give immunity from these diseases only.

QUESTION: What does the United States owe in war debts, and to whom?

ANSWER: The war debt of the United States is now approximately $18,200,000,000. This money is owing to the holders of the Liberty bonds and other obligations. These were all sold in the United States.

QUESTION: Why do they refuse to permit the films of the Dempsey-Tunney boxing match to be shown anywhere in the United States?

ANSWER: Under an act passed July 31, 1912, it is unlawful for any person to mail, or to deliver to a common carrier, or to send from one state to another, any films of any prize fight or pugilistic encounter under any name, which may be used for the purpose of public exhibition.

QUESTION: By what means do they measure the depth of the ocean and how deep is the deepest place?

ANSWER: Depths in the ocean are sounded with steel piano wire not more than 1-30 to 1-25 of an inch in diameter and a detachable lead seldom weighing more than 70 pounds. The soundings are made by means of a special machine fitted with a break so adjusted that the revolution of the drum is stopped automatically the instant the lead touches the bottom, and the depth can then be read directly from an indicator. The sounding machine measures the length of the wire which runs out before the lead touches bottom. The deepest place, 31,366 feet, is near Porto Rico.

QUESTION: Who held office for one day between Wilson's administrations, and how did it happen that we were one day without our real President?

ANSWER: President Wilson took oath of office on March 4, 1917, his first term having expired March 3, 1917. He was President continuously from March 4, 1913 to March 4, 1921.

I READ IN THE PAPERS

The results of the Missouri Crime Survey are summarized succinctly in the Kansas City *Star*. They are important as revealing not only local conditions but conditions which exist pretty generally throughout the country.

Crime Survey Brings Surprises

Chance of escaping conviction:
For Murder or Manslaughter—11 to 1.
For Robbery—28 to 1.
For Burglary—50 to 1.

Why?

The coroner is not required to be a physician or to qualify as competent.

The police department under state rule is a political football. It is undermanned, and many members are aged or inexperienced.

The county sheriff's force is inadequate. It cannot arrest outside the county. State police are necessary to cope with the motor age criminal.

The prosecutor may dismiss charges without explanation. He should be under jurisdiction of the attorney-general.

A loose bail bond system permits almost anything.

Presumption of innocence of defendant, even though convicted and on appeal, is a hindrance. There is no presumption in civil cases.

The criminal code is obsolete, copied after an old English code that was revised years ago.

Extra jury challenges to defense give an advantage. They should be divided equally with the prosecution. A stricter jury exemption is needed.

A mush-mouthed, weak-kneed public aids the criminal through reluctance for jury service; changing of testimony; and failure to stick with the prosecution through delays.

The 'expert testimony' provision by alienists, physicians and others is abused. There can be no comment when a defendant does not take the stand. Comment should be allowed.

A year for appeal upon circuit court conviction is unnecessary.

A shoddy parole system and housing of young prisoners with old criminals increase crime.

It would be pretty droll if China sent a gunboat up the Mississippi to a point opposite Herrin, Illinois, to protect some hand laundry in the vicinity.—Detroit *News*.

ɤ ɤ ɤ

Sixteen years ago Virgil Himelick who lived near Summitville, Indiana, brought home to his father's farm a quart of yellow corn which had been given him at school. With it he intended to raise some prize-winning ears. But his father frowned on the proposition and it was only after much persuasion he was permitted to plant his seed on the farm. Today that quart of corn has grown into a business so profitable that it requires an immense building, three stories high, which is capable of holding 1,000 bushels of corn. The first crop of Virgil's corn contained a yellow ear which won the prize offered by the school for the best ear of corn in that district. This success spurred the lad on to do better next year. Each year his corn took prizes and became known in surrounding counties and eventually throughout the Middle West. Finally other growers showing at county fairs were so far outdistanced by the boy that they refused to enter their product. Virgil now exhibits in state and international shows and has many prizes to his credit. Seed-corn buyers were attracted by his success and so great has this business grown that additional buildings must be erected to care for the seed.

A Quart of Corn Which Grew

Hard times are those in which people pay the debts they made in good times to buy something they didn't need.—St. Paul *Pioneer Press*.

ɤ ɤ ɤ

Now that business and various allied interests have had their fling at suggesting laws governing the planting of cotton, and the regulation of cotton surpluses, the *Farm and Ranch*, of Dallas, Texas, as spokesman for southern agriculture, offers reciprocal suggestions. These are printed below without comment:

A Good Many Things Too Many

'There are too many drug stores. Reducing the number by half would decrease overhead and increase store volume of business, making it possible to operate on a smaller margin of profit. Therefore, we should have a law limiting drug stores to one for each 1,200 inhabitants.

'We suggest a law limiting the number of grocery stores to one for every 1,000 population. It is a well-known fact that there are too many grocery stores and that prices are unnecessarily high because of the heavy overhead and excessive operating expenses.

'There are too many banks. A law reducing the number by 25 per cent and the lowering of the rate of legal interest would benefit the entire population.

'A law reducing the number of newspapers, farm papers and magazines would increase circulation volume of those licensed to operate, increase the amount of advertising and make possible better papers and better magazines.

'*Farm and Ranch* suggests the adoption of Will Roger's remedy for congested streets and highways by prohibiting the operation of any motor that is not paid for.

'The number of commission merchants and middlemen of all classes handling food and feeds is far too large. Let's have a law that will reduce the number by 50 per cent and limit profits to 7 per cent on the investment.

'We would reduce the number of filling stations by 75 per cent.

'There are too many drummers. One can see a dozen in a country store that has less than $2,000 worth of goods on the shelves all of them trying to sell a bill of merchandise. Cut them by half, thus decreasing the cost of doing business.

'There are too many of everything, just as there are too many bales of cotton. Let us be fair in the matter and put a Government inspector in charge of every farm and of every store and factory. Only one out of every ten or eleven persons engaged in gainful pursuits has a Government job, and we submit the question: Is it fair to the rest of us? Everybody ought to have a Government job, and if we pass the laws we have suggested, this great injustice will be remedied. We are for less work and more money.'

ɤ ɤ ɤ

With 50,000 election districts missing out of 50,000 election districts, William Hohenzollern announces that the German people want him back.—New York *Times*.

ɤ ɤ ɤ

A Paris newspaper, *L'Œuvre*, not discouraged by an earlier effort to have a suitable hymn written for the League of Nations, has begun a new movement for an international anthem. A competition among the poets and musicians of the world is under way, the goal being a song which may appropriately be sung at League meetings, expressive, of course, of the ideals of the famous body which meets on the shores of Lake Geneva.

International Anthem Movement

Unfortunately for the high hopes the contest might inspire, patriotic hymns written to order have turned out rather badly in the past—one needs only to recall some of the State anthems in our own country for evidence. *L'Œuvre's* aim is a worthy one, but it has another handicap in addition to the difficulty of discovering the poet and musician who can turn on their inspiration like water from a tap. The League of Nations is too abstract a conception for us to become tremendously stirred up about as yet. We must wait another thousand years before the human race bursts into song over world peace and the agencies that have helped to bring it about. From a musical standpoint it would be just as well to have the various national anthems sung at Geneva in alphabetical order at the opening of each League session.—New York *Evening Post*.

The International Jew in 4 volumes: *The International Jew*, Vol. 1, 235 pages; *Jewish Activities in the United States*, Vol. II, 256 pages; *Jewish Influence on American Life*, Vol. III, 256 pages; *Aspects of Jewish Power in the United States*, Vol. IV, 246 pages. The real-estate bond business has increased more than 1,000 per cent in the past five years. It is an important element in the great new 'industry of debt.' Many, in fact most, of the huge buildings now being erected in the larger cities are built with borrowed money—money that comes from small investors. Such a situation is deserving of a careful and impartial scrutiny. It is given that scrutiny in this article. (p. 1)

¥ ¥ ¥

All important varieties of energy used by man can be traced back to the sun. So, too, can many of the phenomena that occur on the earth. Scientists have made many interesting discoveries as to the relation between the sun and the earth. Here one of the greatest scientists of the country tells the significance of these discoveries. (p. 6)

¥ ¥ ¥

Let's take just one more look at the year just past. What happened in 1926 that was worth-while; what happened that we, as ordinary citizens, might well be ashamed of? (p. 4)

¥ ¥ ¥

There is always something romantic about happenings at sea, romantic and mysterious. Many of the 'ghosts of the sea' may be ghosts of imagination; but others cannot be explained away that easily. Here is a yarn by a man who has sailed the sea, and knows its moods. (p. 16)

¥ ¥ ¥

A few weeks ago THE DEARBORN INDEPENDENT printed an article on American shipping by W. C. Cowling. That the article was authoritative is attested by David P. Marvin, publisher of *The Marine Journal*, which is a leader in its field:

New York City.

Your writer has many fine, clear ideas, and in many ways we are in agreement.

Unfortunately, the need seems to be for a *definite shipping policy*, which he italicizes. Now one of the defects of a democracy is that it never has a definite business policy; it always refuses to be bound by anything as inflexible as that. It wants to get investors to put their money out, and then withdraw support, having accomplished its end. But maybe we have, as we hope, the most intelligent democracy there ever was, and can do something which has never been done before. The A. E. F. was the first successful overseas expeditionary force sent by a democracy against a considerable enemy; maybe we can get this done. If we can get the agricultural population to see that their financial interest depends on water delivery under our own control, a definite policy can be followed . . .

DAVID P. MARVIN,
Publisher
The Marine Journal.

The difference between a 'Realtor' and an ordinary real-estate agent is explicitly explained in the following message:

There has just come to my attention an article called 'Great Names in "Blue Sky" Swindles.' I feel that you have made a very loose and improper use of the term 'Realtor,' and also wish to take exception to some of the implications with respect to 'Realtors' in this article.

'Realtors' are members of local boards affiliated with our association and the term is not synonymous with real estate men. It is evidently in the latter sense that you may have used it.

It was the 'Realtors' of Florida, that is to say, the members of the local real estate boards in Florida, who did their best to stem the tide of speculation. It was the Realtors of Florida who went to the State Legislature and asked for the immediate adoption of a real estate license act, so that there should be some regulation imposed upon real estate operators and brokers, and so that the public might be protected.

We are trying to build responsibility and integrity into the real estate calling through our association. We are trying to distinguish the person who abides by our ideas as to how a business should be conducted by calling him a 'Realtor.' As an advocate of clean business, I know we will have your sympathetic support in this effort. May we not, therefore, hope that you will in future articles not use the term 'Realtor' in the manner in which you have in this article?

We recognize that because real estate is tangible and a good investment there are men who will take advantage of the public. These men, however, we do not have among the ranks of the Realtors, and we do not wish to bear the onus of their misdeeds.

H. U. NELSON,
Executive Secretary,
National Association of Real Estate Boards.

Letters from those who like the magazine are always welcome. Here are some chosen at random from one day's mail:

I have been moved time and again to write to you, merely to express my personal appreciation of the numerous articles and editorials that I have found myself so completely in sympathy with.

We have a very few magazines in this country that are really educational and broadening. For THE DEARBORN INDEPENDENT I have a feeling of respect and admiration, and I also feel that it is truly enlightening.

The pleasingly balanced diet of matter you open before us is highly conducive to a healthy mind. Some of your historical articles are of great interest. President Lowell's 'Recent Tendencies in Education' is commendable. Your efforts in 'This to You' and 'This from You' cannot be sufficiently praised.

P. A. NETLAND,
Hanover State Bank,
Hanover, Minnesota.

Ada, Minnesota.

As long as the matter and the editorials are as they are now, I am glad to subscribe. In no other magazine can you find the frank material which you find in THE DEARBORN INDEPENDENT. It runs in the unusual channels and fills a field which no other means of public information supplies. It is wielding a widening influence in getting people to think for themselves.

Respectfully yours,
GILBERT A. BRATTLAND.

Due to an error the *Book of James* was changed to *Epistle of James* in the recent article, 'Reliability of the New Testament,' by Henry A. Sanders. The *Book of James* is an Infancy Gospel written late in the Second Century and is published only in the Apocrypha of the New Testament. It is not particularly well known even to ministers.

Forty Years Ago

From McGuffey's Fifth Eclectic Reader
Series of 1879

1

I've wandered to the village, Tom,
I've sat beneath the tree,
Upon the schoolhouse playground,
That sheltered you and me;
But none were left to greet me, Tom,
And few were left to know,
Who played with me upon the green,
Just forty years ago.

2

The grass was just as green, Tom,
Barefooted boys at play
Were sporting, just as we did then,
With spirits just as gay
But the master sleeps upon the hill,
Which, coated o'er with snow,
Afforded us a sliding place,
Some forty years ago.

3

The old schoolhouse is altered some;
The benches are replaced
By new ones very like the same
Our jackknives had defaced.
But the same old bricks are in the wall,
The bell swings to and fro;
Its music's just the same, dear Tom,
'T was forty years ago.

4

The spring that bubbled 'neath the hill,
Close by the spreading beech,
Is very low; 't was once so high
That we could almost reach;
And kneeling down to take a drink,
Dear Tom, I started so,
To think how very much I've changed
Since forty years ago.

5

Near by that spring, upon an elm,
You know, I cut your name,
Your sweetheart's just beneath it, Tom!
And you did mine the same.
Some heartless wretch has peeled the bark;
'T was dying sure, but slow,
Just as that one whose name you cut
Died forty years ago.

6

My lids have long been dry, Tom,
But tears came in my eyes:
I thought of her I loved so well,
Those early broken ties.
I visited the old churchyard,
And took some flowers to strew
Upon the graves of those we loved
Just forty years ago.

7

Some are in the churchyard laid,
Some sleep beneath the sea;
And none are left of our old class
Excepting you and me.
And when our time shall come, Tom,
And we are called to go,
I hope we'll meet with those we loved
Some forty years ago.

MUSSOLINI *as* Arbiter *of the* Fate *of* Italy

By JAMES S. WILBUR

WHAT is to be the destiny of Italy? Will Benito Mussolini, whose person centers e authority and dis-)line of an entire nation, rvive the uncertainties the Italian character? There is only one man-r of analyzing Dictator ussolini's position, and at is to approach it from e hypothetical side. hether he will wholly cceed in his task of build-g a great Italy and re-nerating a people whose ry loves are comparable ly to its intense hates an experiment which all irope, indeed the world, ay well begin to watch th interest.

Four years ago Benito ussolini found Italy at e crossroads. It was der, work and discipline, chaos and self-destruc-)n. Now once more aly is at the crossroads. hich highway the ancient nd of the Caesars is to llow after four years of internal scipline and reconstruction is a deci-)n which has passed out of the hands the Italian Duce. This decision is the hands of a people who have passed rough centuries of turbulence and riods of master-mind rulership not like that which began four years o.

Those who have climbed the steep les of Mount Vesuvius and stood thin the lava-encrusted crater have rhaps had the same feeling that a ose observer has in all Italy today. elow one watches with languid in-rest the thin line of smoke issuing om the cone above. There is a illiant sun and a sky of gentle blue at soothes. Once aloft and in the ater, however, there is the shock of subterranean rumbles and violent effusions of smoke and flame as pent-up pressure finds an outlet. When, one asks, will the big explosion come?

KNOWING the Italian character perhaps even better than his ancient predecessors, the Italian Duce has banked upon force to maintain order within Italy as well as to command respect from international neighbors. Under conscription which calls all matured male Italians to the colors for from six to eighteen months, Mussolini is enabled today to bring together a well-trained and adequately equipped army of five million men . . . These forces are designed to impress Italy's neighbors and enemies alike, and possibly act as a legitimate urge upon them to assist, peacefully, in solving the serious problem of finding territory on which Italy's fast expanding population may be planted.

Why is Italy again at the crossroads? What has happened? Let's put it briefly, somewhat chronologically:

More than four years ago Italy was on the rim of red communism, a bewildered nation in which ministerial inefficiency was second only to national lethargy and slovenliness. Italy lacked the strong hand. Mussolini came from the social depths and supplied it. Fascism was the magic battle cry. It rallied from all sections of the peninsula. It was on the lips of blackshirted youth who converged on Rome and swept over the ancient capital to submerge all Italy.

Socialists, communists, dissenters of any creed or nation, were caught in the flood of Fascism and came out with broken heads or suffering special treatment with castor oil. There was a Socialist deputy, Giacomo Matteotti, who persisted in his hostility to the new régime. He was kidnapped and brutally murdered. There were thousands of cases of near murder and perhaps tens of thousands of pillage and violence. Each had its aftermath of smoldering, repressed hatreds which, like the subterranean gas of Vesuvius, must some day reach the surface.

The much-discussed iron hand of Benito Mussolini has found its strength in the reign of terror carried out by *il Duce's* Fascist battalions. Much in the same fashion that Porfirio Diaz, of Mexico, used to send his Rurales to chastize those bold enough to criticize the régime, Fascist chiefs in Italy have sent their blackshirts to teach enemies of Fascism lasting memories of the imprudence of word or act against the Supreme Chief.

What has happened in an administrative way in Italy is too well and generally known for detailed reiteration—opposition press relentlessly silenced, freedom of speech and liberty of action destroyed, parliament reduced to Fascist representation and power of absolute dictatorship vested in the hands of one man. There is no doubting the organizing genius of Italy's dictator. It is not difficult to say that he is a great man. He knows the Italian people and their temperament.

By the organization of industrial

and labor syndicates with all strings leading direct to Rome, he has eliminated the dangers of strikes and lockouts. He has Fascistized agriculture and fought a winning battle against foreign wheat. He has developed water power and diminished Italy's need for foreign coal. He has reorganized the army, navy and air forces. In short, during the brief space of a few years, Mussolini has lifted Italy from far down in the rank of nations to the border line of first rank —if Italy afforded the natural resources and national temperament to reach this category.

FROM bases at Spezia and Taranto, he can mobilize a formidable host of light, fast naval craft, many of which are the last word in modern construction. Notably, during the past two years an Italian merchant marine has been floating as a powerful auxiliary for the new fleet. Figures not generally known, perhaps, are in the files of foreign naval and army air attachés in Rome showing that Italy's air program reckons some three thousand airplanes and seaplanes. The Italian air budget for 1926 was greater than that of the United States.

The development of military, naval and air forces, however, is somewhat beside the point. But what about the Italian character? Has Mussolini felt that he was building upon a solid basis with this war machine alone? Not in the least!

Benito Mussolini's personal position—his iron hand—within his country has another meaning. He has organized his rabble which he led into Rome four years ago as his personal Fascist militia. Whereas the army, navy and air forces are offensive or defensive units dealing with foreign forces, the blackshirt militia is *il Duce's* protection against the imponderable Italian temperament and, if you will, the Italian character.

THERE is a startling precedent out of the Middle Ages, in the case of Cola de Rienzi, which will demonstrate the capabilities of the same citizenry which is gyrating around the Mussolini of today. But in the meantime, what of this Fascist militia which is the root and stock of the Italian dictatorship? It comprises some 190,000 blackshirts as a 'first line national security' force with a more loosely knit second line of 100,000. These legions today cover every section of the country.

In addition to his regular militiamen, of which Mussolini is the recognized commander-in-chief, *il Duce* has been careful to take into his own hands all vital lines of national communication. There are some 28,000 blackshirts operating the railways, three thousand in control of posts and telegraphs, and a special corps of four thousand more known as 'port militia.' The latter have in their hands every access from the sea, every port, every wharf. Thus as counterpart to internal revolt, Italy's dictator has the railways over which rebellion might converge on Rome, the wires and mail services through which conspiracies might be organized and ports through which arms and munitions might be brought into the country.

Blackshirts in Italy today not only control vital communications so precious in times of stress, but the actions and thought of a nation of twenty-nine million people. They crack heads, raid private domiciles and maintain order for all except themselves. How long can such a situation last? Possibly not forever.

GOING to Italy not to meet and interview Mussolini,' wrote a well-known American novelist recently, 'but to go about in the rôle of writer and observer to discover what was going on, the situation I found possessed an astounding color. What exists in Italy is, if I am not seriously mistaken, hysteria rather than healthy enthusiasm. I spent in Rome the day given over to the annual Fascisti celebration, the day of the recent attempted assassination at Bologna and the day of the dictator's return from that city. I visited a dozen cities, talked with the people and (what was a more illuminating experience) with foreigners living there. I saw the parades and attended the meetings. The total impression gained was one of impending disaster. A country cannot continue in such a state of nerves, under such a dictatorship, indefinitely. Something must happen . . . assassinations, wars or another revolution.'

When Mussolini ordained the law against Freemasonry and other secret societies, Masons, particularly, became objects of the hunt. Their heads were cracked, their homes raided. When the Rome foreign office intimated that plots against Italy were stirring among Italian expatriates on French soil, Frenchmen became enemies of Italy's blackshirts and irrepressible groups of this militia raided French consulates at various places and assaulted French railway workers at a frontier junction. Fascist newspapers heaped hate and vituperation upon their Latin neighbors. Each attempt upon the dictator's life was a signal for anti-French demonstration and, eventually, France demanded immediate official apologies to which Mussolini readily assented.

THERE have been indications for the past eighteen months that Italy's ruler has sought to curb the excesses of his blackshirt legions. Heads have fallen. Caesar Rossi, chief of the official press bureau at Rome when the Deputy Matteotti was murdered, suspected knowing of the plot, is today an exi His property has been confiscate Robert Farinacci, secretary general the Fascist party, proponent of stron arm methods and violence, was sum marily dismissed by *il Duce*.

The last leader to incur the chie tain's wrath was Italy's Minister Interior, Sigñor Federzoni, possibl because he sought, with the aid Riccioti Garibaldi, descendant of t famous liberator, to manufacture a fa conspiracy against Italy in Franc This plot, the French insist, w hatched to discredit French prote over the official Italian claim th France winked at plottings against h neighbor.

Fearing his chief collaborators mo and more, Mussolini added the Minist of Interior—with its control of secr police—to his own individual list cabinet portfolios. Aside from t premiership, Mussolini now holds t posts of ministers of War, Nav Aviation, Foreign Affairs and Corpo tions in his own cabinet.

Has Mussolini lost or is he losi control over the bastion behind his ir hand—his Fascist militia? Will he able to curb the violence of this p sonal bodyguard, or will it turn up him because of his own moderatio These are questions which the futu must answer for Italy. Will the dic tor continue to throw the 'raw me of bombast to these legions wh apologizing for their acts to fore countries?

FOLLOWING the attempt upon t dictator's life at Bologna, late October, by a deluded fifteen-year- youth, instantly knifed to death in tracks and stamped beyond recognit by an infuriated mob, he proceed calmly to the railway station wh troops were drawn up as a guard honor.

'Raise high your rifles,' he exhort 'so the world can see this forest bayonets.' There was no mention the attempt upon his life. But in state of excitement, it was enou

Fascist violence ran riot in ma parts of the country. Those suspec of anti-Fascist sentiments were hun out, insulted and assaulted. An offi censorship of all news leaving country kept many of these incide under cover.

The *Impero*, an extremist Fas organ, of Rome, expressed the attitu of militants when it hailed the n phase as 'the end of Italy's democra past.' This organ advocates the retu of the old Roman law giving all a sundry the right to slay enemies of country wherever found.

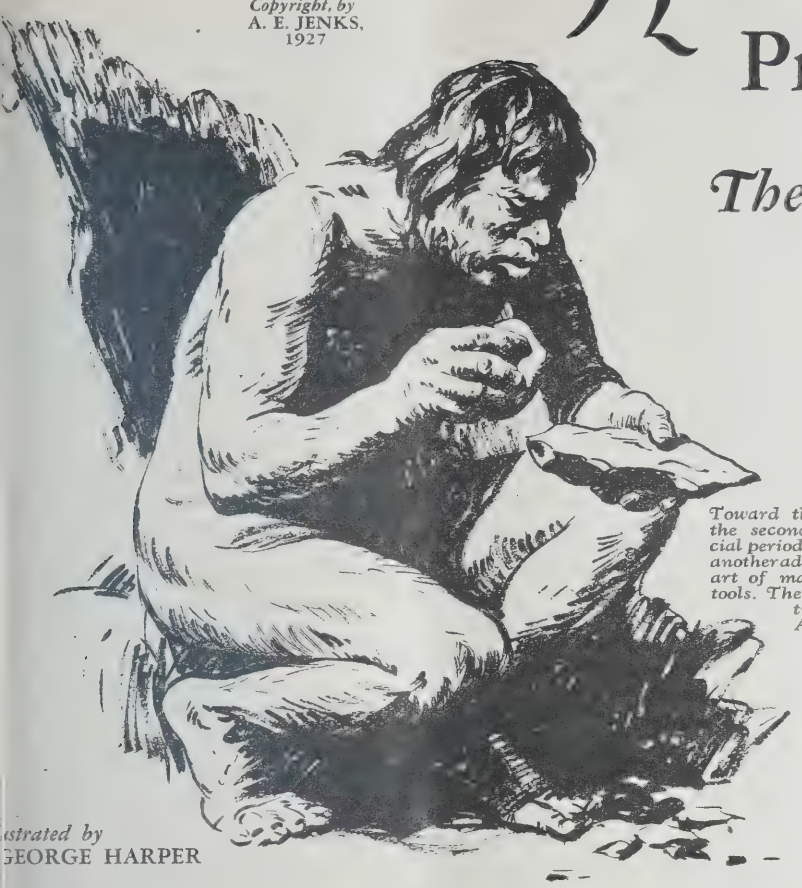
'Italy's democratic past is dea said *Impero*, 'and no one mourns thi monstrous creature which was liberty of the press.'

By A. E. JENKS

How Primitive Was Prehistoric Man?

The Maker of Stone Implements

Copyright, by A. E. JENKS, 1927



Toward the close of the second interglacial period there came another advance in the art of making stone tools. The new industry is called Acheulian.

Illustrated by GEORGE HARPER

SHOULD one attempt to discuss the material culture of modern man, he would be swamped by its multiplicity. But primitive man traveled light. I was once the trail with a savage family mov- out of the old house into the new. ie man walked lightly laden with his apons. The woman followed, carry- on her back, from a headband over r crown, every other material thing e entire family possessed, including e rolls of matting and birchbark to ver the new dwelling.

For us it will be easy to sweep away m the culture-picture of our daily es the common things which the nerican Indian did not possess. eep away the city with its stores, tels, churches, theaters; its pave- nts and street cars, buses, trucks d autos. Sweep away from the home e dining room with its table, chairs, d dishes; the library with its books d periodicals, the bathroom and its b; the bedroom, its bed, wardrobe, d mirrors—but leave a small supply red grease paint. Sweep away the oking stove—in its place are three nes, some ashes and smoldering als. Leave one room on the earth for in which the family members all e born and die, where they cook and et and sit and sleep.

Around its short wall-line are small ndles containing all the material things the family possesses—clothing, weapons, tools, stores, treasures, precious heirlooms. The savage traveled light. The prehistoric man traveled lighter still. Some things, however, we know he did possess, because they are of enduring stone and have been preserved from early human times over wide areas of the earth.

The time of which we are to write is spoken of as 'prehistory,' and of course it is a time preceding written history; but in mineralized bones and in stone implements from known geologic strata already recovered from South Africa to the British Islands, and from Japan to the Atlantic shores of Europe, the peoples, cultures, and certain events of those early days are being read as from a familiar book. And systematic researches are now so common that annually new paragraphs are being read and fitted into their proper places. Just as large books are written word by word, sentence by sentence, paragraph by paragraph, chapter by chapter, so every other product of thought develops from simple beginnings. Man did not begin his industry of stone implements with chipped arrowheads, leashed to slender arrows guided in their flight by feathers.

Hand ax, an Acheulian implement, delicately chipped. From Tunisia, Africa.

In the earliest periods are the crudest stone tools, called 'eoliths,' or dawn-stone tools. Eoliths are stones which early man picked up and used to assist his teeth, hands, and feet. Professor Aime Rutot of Belgium has, in all probability, given more time than has any one else to field and laboratory research on the subject of eoliths. To see in his laboratory in Brussels his demonstration of eoliths is a not-to-be-forgotten privilege.

As Professor Rutot points out, there are five purposeful movements of the hand which can be assisted by a stone held in the hand:

First, is the movement to *pound;* and a stone grasped in the hand was used to break, to crush, to macerate.

Second, is the movement to *cut;* and a rather thin, sharp-edged stone was used to cut like a knife.

Third, is the movement to *chop;* and a thicker, coarser, sharp-edged stone was used to chop or to chisel.

Fourth, is the movement to *scrape* or to *smooth;* and a blunter sharp-edged stone was used to wear away the surface.

Fifth, is the movement to *pierce* and *penetrate;* and the pointed stone was used to punch and pierce.

Man first picked up and used such stones as would well suit his simple fivefold need; to pound, to cut, to chop, to scrape, and to pierce. In some of these stones a certain adjustment was made so that they would better fit the hand and not injure it. By use the edge of the improvised implement became worn or chipped.

One way to distinguish the man-used eolith is that the part which shows chipping, as from use, is the part exposed for use when the crude implement fits best for service in one's hand. The other is that as the stone is held in the hand, as for use, the chipping is visible only on the back side instead of on the front side. Eoliths are most abundantly found in Southern England, Belgium and France.

Fortunately for revelation of the

truth of the early days during the prehistory of humanity, one group of people, the Tasmanians, who lived on the island of Tasmania, just south of Australia, was in the earliest stage of stone culture at the time they were known and studied by the white man, and they continued to make eoliths until their extinction, fifty years ago. Thus, most surprisingly, we have from actually known human usage the full complement of early stone implements; men who numbered eoliths among their common stone implements have actually been seen to use and modify the eolith.

BUT even if this were not true, we should be obliged to assume the eolithic implement as a matter of cultural necessity, because man must have used stone implements as crude as eoliths before he was capable of making the implements of the next higher stage of culture, namely, the Pre-Chellean.

Following the extremely crude eoliths which stare at one from the very dawn days of humanity, there was a stage of culture of very evident design. It is called 'Pre-Chellean.' It marks the beginning of the Quaternary epoch in geological time, and was a period of long duration. Cultural progress in those early days was slow, the duration of Pre-Chellean culture covered the geological time of the Gunz Glacier, the first great glacier of the glacial period, also the Gunz-Mindel interglacial period, and the Mindel or second glacier. It covered the life era of the men represented by the Piltdown race.

The Pre-Chellean culture is abundant, especially in England, as with the Piltdown man; in France, in the famous early strata of the valley of the Somme; in Belgium; and in Spain, as at Torralba. Such numbers of Pre-Chellean implements have been found that the museums of prehistory in Europe have them by the many hundreds and the thousands.

Pre-Chellean culture is distinguished from eolithic culture in that, in addition to the eolithic implements which were continued in use, there appeared two types of implements which as they plainly show were purposely though rudely chipped. One was a sort of crude hand-cleaver or ax-like stone, which was purposely chipped by a hammerstone, but which is rough, and chipped with little design or control of blow. The second was a slightly reshaped flint chip; its rechipping made the crude tool of slightly better use.

Man thus lived through the cold period of the Gunz Glacier, on into the warm first interglacial period and survived the returning cold of the Mindel Glacier with no great advancement in his culture.

With man's advent into the subtemperate climate of the second interglacial period there is a distinct advance in his stone art. It is that of the Chellean stage. It was first named by G. de Mortillet after the town Chelles on the Marne River just east of Paris. Near Chelles there was an extensive old river terrace of sand and gravel twenty-six feet thick, halfway down which were the strata of the first found Chellean implements with the bones of elephants, rhinoceros and hippopotamuses of the early warm or interglacial period. The distinctive Chellean implement is the hand ax, or cleaver, or, as it is everywhere called, the *coup de poing*. It was deliberately chipped on both faces. The handhold end or butt is rounded. The work end is well pointed, and the sides or edges are sinuous. It could be used for all the five fundamental movements of the hand emphasized by Rutot. It is from two inches to fourteen inches long.

THE Chellean men also began to perfect a hand-knife with cutting and sawing edges whose back was often chipped dull and smooth, or less sharp, to fit the hand and forefinger. Also there are found well differentiated implements chipped to a point and used for piercing and scratching in a definite area of restricted compass.

The Chellean culture stage, represented by the Heidelberg man and also, perhaps, by the Rhodesian man covered most of the Mindel-Riss, or second interglacial period, which was the longest and warmest of the three interglacial periods. Since the climate was hot and humid, it was favorable to abundance of plant life, and hence to abundant food for animals and men.

Toward the close of that second interglacial period (Concluded on page 23

Artist's impression of an Acheulian home site, in the open country.

Man's Own Flat Wheels

Needless Abuse *of that* Marvelous Mechanism, *the* Human Foot, *Causes* Fallen Arches

By MYRON M. STEARNS

Drawings by RICHARD BROECKER

DO YOUR feet hurt? If they do you have plenty of company. Probably no fewer than 25,000,000 Americans share your trouble.

Try it on your friends. 'It's a funny thing,' you may begin—though it is sometimes hard to see anything funny about it—'but when I first get up in the morning my feet hurt like a toothache. Then, after a little while, they're all right. Do you ever have any trouble like that with *your* feet?'

You'll be surprised. If they don't have that trouble, it will be some other, equally poignant. It may concern the bunion corn. It may be a tale of dogs that ache at night, after a long day in the office. It may run to sharp little pains in the front of the foot, experienced when walking. It may be a whole volume of woes, leading to the very threshold of what seems like a Grade-A attack of rheumatism. If among all your acquaintances you come across a single one with no complaint to make, write yourself down as a better detective than Diogenes. For foot-faults today are almost universal.

You can't blame the feet. That the gentle foot can take from a hundred to two hundred pounds forward, backward, or sideways without trouble or complaint thousands of times a day is itself a miracle. Imagine stumping around on the ends of two bones if you want to get an idea of how our system would be shocked if there weren't some way to break the jar. Even with pads on the bottoms of the bones, it wouldn't be much better—any more than an automobile without springs would make comfortable riding.

Our feet, as a matter of fact, are mighty smart little inventions. To take the jar of walking they are constructed in such a way that we stand practically on tripods, with patent elastic ends; one neat little tripod in each foot, made of the very best assorted bones. One corner of the tripod is in the heel. The front corners are at the sides of the ball of the foot, just behind the toes. Between these corners are two low arches, a short one across the ball of the foot, and a longer one at right angles to it, from the top of the front arch to the heel. The weight of the body rests, with a universal joint at the ankle, on this tripod.

In walking we strike first the heel (the hind corner of the tripod), then carry the weight forward onto the ball of the foot. The ends of the tripod are fastened together by layer after layer of excellent muscles, that give way a little, like tough rubber, and allow the bones to spread a bit when weight is applied. That takes the place of automobile springs, and enables us to walk without shaking our teeth out. It is, I submit, neater and more efficient than an automobile spring. But it is also more complicated and delicate.

In the early days, before the big jump from the treetops, our ancestors got along all right. The feet, carrying only the rear or stern end of the body, had nothing to kick about. They had grown up in the business. A good deal of climbing and grabbing had been done with them, too, so that they were tough and nimble and well developed. Four good, serviceable, body-carrying hands, our remote arboreal forebears evidently possessed. Look at almost any member of the monkey tribes and see. Some people can even control the muscles in their toes still, so that they can stretch them apart like fingers and grab with them readily—fantastic inheritance from those distant days before men became hairless, and invented corporations to do their grabbing for them.

Feet, in the days of the ancients, were something to be seen and made much of. Every little dimple had a meaning of its own.

But when primitive man raised himself above the tall grass of the jungle and began padding around on his hind legs, he walked into trouble. Walking on one end suddenly threw a double strain on the rear set of hands. They were too soft, and too small. The weight was considerable. Anthropoid apes at times suffer acutely from various foot disorders, and we can safely assume that early man, who walked barefoot, suffered with them. Coming down hard on hidden stones, he bruised his feet. Thorns stuck into the palms, now turning into soles.

Under the double burden that the whole body imposed, the feet began to get bigger and stronger. In time, perhaps, they would have hardened and learned to like their work. In the natural course of development they would have been banged and toughened eventually into regular hoofs or equally thornproof pads. But civilization stepped in and stopped all that. Civilized man got impatient. He decided he couldn't wait any longer for the slow processes of nature. He'd put an artificial hoof on the under side of his still soft foot, and gain a couple of eons at a single hop. He invented shoes—or, rather, sandals.

That was a pretty good idea. The ancient races made excellent use of it—a smooth hard pad, strapped to the under side of the soft human foot, to make its work easier. No more thorns, no more bruises, no more burrs between the toes.

Feet, in those days, were still something to be seen and made much of. Sandals, you see, left them exposed. The Greeks paid close attention to the form and culture of the foot. Every

little dimple had a meaning of its own. It was as bad manners to come to dinner without washing your feet as without washing your hands. Egyptians gave due attention to feet. Pedicures in the barber shops were quite the thing, just as manicures are now. Even in Roman times Egyptians were renowned as expert pedicurists. And in Roman wars, you remember, the legions often marched from one end of the known world to the other. Their feet were well attended to.

THEN things began to go wrong. Perhaps, as they won their way farther and farther north, the centurions began to get cold feet. Sandals gradually fell into disuse. Moccasin-like hides, with the fur side turned inside, were wonderfully comforting in winter; the bare feet retired into their furry recesses.

The practice of chiropody retrograded, as civilization, and with it body culture, fell below the level of the Roman period. Instead of keeping the feet strong and beautiful, something to be proud of, like well-shaped and well-kept hands, the folk of the early Middle Ages began to neglect them, and as they became less attractive, hide them more and more in primitive shoes. As early as A. D. 500 Saxons were definitely committed to one hundred per cent footwear. The next five hundred years saw a transfer of attention from the health and strength of the *foot* to the looks and shape of the *shoe*. And there she stayed. Shoes became pointed. It was a style. Pointed shoes made feet look less like feet.

So man's effort to improve on nature with artificial feet has more or less gone wrong. Instead of merely assisting feet by adding artificial walking-surfaces without hindering their gradual development, modern shoes have, to a great extent, prevented even adequate growth. Instead of getting harder and stronger, more and more able to bear the unusual burden that man's upright position has thrust upon them, our feet are continually getting softer and weaker. And the smaller they get, and the less able to do their work, the prouder we are of them.

During the last few decades we have been getting a lot more of these good ideas. We now ask our already weakened feet to do still more difficult things. By using railroads, bicycles, and automobiles we take away whatever chance they had to toughen and develop properly through abundant exercise; and, at the same time, we make them do their stuff on city pavements and concrete roads, that add immeasurably to the shock and strain of walking. The result has been just what you might expect. Only, because it's so obvious, we're just beginning to find it out.

Bad foot conditions affect our vitality and spirits and efficiency more than we realize. Tired or painful feet will tend to break down anyone's 'morale.' To paraphrase an advertising slogan, 'Ask the man that has them.'

To understand how the shoe of civilization pinches, we need only to take one good look at the inside of the foot.

There are seven fine bones fitted carefully together in the heel and middle of the foot, but the ball of the foot, and the toes, are a regular little boneyard. From the main seven-bone structure, five metatarsals run down to the base of the toes. The front ends of these, just behind the toes, are higher in the center of the foot. That constitutes the forward arch. In front of the arch there are fourteen more bones in the toes. The bones in the back part of the foot remain pretty much in one position, but the five metatarsals spread out as the weight is brought forward in walking, and the toes spread out with them.

There is the whole thing in a nutshell—or, as you might say, in a small shoe. Unless the toes, and metatarsal bones of the forward arch, have room to spread out, the muscles that pad the foot and give elasticity to the tripods get no chance to do their work. Th they lose interest in life. When, neath the strain of walking, t weakened muscles become inelastic unduly stretched or bruised or in a way incapacitated, there's the dicke to pay. The muscles are anchore with ligaments, around the bon And the ligaments, although tough a unfeeling members in themselves, fast to a delicate tissue-paper-l lining around the bones known as periosteum. Here is where nerves located with a generosity that wou surprise you.

IN the cases that we call flatf or 'fallen arches' the muscles usua become inelastic, the ligaments pulled out of place, and the sensit bone-linings are disturbed. Then, you already know if you happen to one of the goats, the fun begins. T pain, in good live cases, may ca aches or twinges or sudden lightni like stabbings in the foot, the calf, thigh, or the hip.

It took the war to wake us Until 1917, we didn't know that, a nation, we have flat feet, like duc But the draft showed us. Nearly f out of five of the men rejected physical defects during the dr according to a prominent New Y specialist who was on the advis board of medical inspectors for New York a throughout t war, were rejec because of m feet.

'Foot defec say the dignit statistical repo published by military auth ties, 'are by far most important all defects fou in the populat of military a Of flatfoot al 301,146 cases w discovered am the drafted m examined in country, while, all, 354,677 wou be rookies had e fective feet. T meant a rate 128.72 per 1, men, or, roug one man out of every eight.

Besides the prev- (Concluded on pag

It took the war to wake us up. Until 1917, we didn't know that, as a nation, we have flat feet. But the draft showed us.

The French View of the French Debt

A GREAT and influential group of French politicians is making every effort to destroy the friendly feeling evident in France today for America. Here in France, especially in the press, not only America but England is subjected to a deliberate program of vilification which threatens the present friendly relations. By pamphlets, by the daily press, and by tremendous placards, preliminary to public meetings, these French politicians are campaigning not only against the ratification of the pending debt agreements but quite as much campaigning against America and against England.

On the billboards of Paris one may read: 'We owe to the United States nothing.' It is intended to be read with all of the various implications of the phrase. Today the public and irresponsible references to Château-Thierry, to Belleau Woods, are almost invariably by way of disparagement, the small number involved and the trifling assistance rendered. 'Let us not be enslaved to the foreigners,' meaning to England and America; this is the heading of a call for a mass meeting of protest.

What a change has come over the French newspapers and the French pamphleteers since 1914, 1915, 1916, 1917 and 1918! In the first years of the great war our assistance was greatly desired and greatly appreciated. To place the utterances of 1914 to 1918 of the same newspapers and the same men alongside their utterances of today would be ludicrous, did it not have a pathetic side.

Recently there has been widely circulated in France a book, *The Great Injustice*, by the French financier, M. Octave Homberg. The author was head of the French delegation to America in 1915, which in company with the English delegation under Lord Reading negotiated the Anglo-French loan of half a billion dollars. The book is written by M. Homberg in his capacity of politician-financier. It now appears to M. Homberg that the notes given to America by France in 1915 to 1918 and 1919 were given 'under duress,' having the dagger at the throat. So also the subsequent loans made by commissions under M. Homberg were made 'under duress,' and the signatures are worth nothing. 'An obligation extracted by force' is the phrase which M. Homberg attaches to the notes given by him for the loans which he sought in America so assiduously in 1914 to 1916.

M. Homberg permits himself many other liberties in addition to the continued references to 'the pretended American debt.' This politician-financier makes (p. 55 of *La Grande Injustice*) the following interesting assertion: 'Behold a country which, before the war, was largely a debtor nation; subject to periodic financial crises which threatened the whole economic structure and from which it succeeded in escaping more than once thanks only to the generous assistance given by France and by England!' This will be news to economists studying the financial history of America.

For the information of the French deputies, M. Louis Dubois has published a pamphlet entitled *Les Accords de Londres et de Washington*, distributed gratis by several newspapers. The author is a member of the Chamber of Deputies from the Seine, a former Minister of Commerce and Industry and former president of the Commission on Reparations. This pamphlet of three pages is printed by 'The Union of Economic Interests.' It is to be hoped that an English translation of this document will be made and circulated since it will show the weakness of the arguments used by French politicians, engaged in toying with friendly relations, to serve political ends.

At the outset the author disputes that any reduction in the loan has been made by the United States. For some of these French politician-financiers interest is a strange and unusual phenomenon. While France today could hardly negotiate a loan at 7 per cent, the granting of a loan by America to France for 62 years at 2 per cent to 3½ per cent seems a monstrous injustice.

M. Dubois protests further against the freight rates charged by American ships—and even more violently against the charges of the English merchant marine. The reasons for the increase of freight are not touched by the author, nor yet the losses due to submarines and the enormous losses of America in the shipping venture. This would not, of course, fit into the argument. The war prices of wheat and coal and all supplies was a part of the monstrous injustice, apparently all chargeable to Uncle Sam, who is so rich.

Even the commercial loan of 407 millions, due to war stocks sold at ridiculous prices to France, comes in for a rather tardy scrutiny by M. Dubois. The fact that the American Government lost upon these sales of material billions of dollars is not mentioned. Uncle Sam is rich, of course, and billions mean nothing to him. It seems that these stocks were sold by the French at a loss, so it is alleged. The goods were bought, the price was agreed upon and accepted, but nevertheless the payment remains open to serious scrutiny by the debtor. However, American trucks, which were sold at about a fifth of their cost, continue in active use in France. M. Homberg finds fault with (Concluded on page 27)

Going *to the* MOVIES *With* Tartarin *and* Therese

By HENRY ALBERT PHILLIPS

There were many single vacant seats, but we were three in number and no one would move to let us sit together.

NOT long ago, I was browsing down in the south central part of France in a quaint little town nearly as old as the Christian Era.

This little town is called Tarascon and it was made famous by Alphonse Daudet, the French novelist, in his three humorous novels: *Tartarin of Tarascon*, *Port Tarascon*, and *Tartarin in the Alps*. Daudet selected Tarascon as the outstanding example of French provincialism—with its charming simplicity, its boasting yokelism yet honest kindliness—that has furnished amusement all over the world where the self-satire has been eagerly translated. Tartarin, the vaunting and lovable Tarasconois, has taken his place with Don Quixote, Gil Blas, Falstaff and all the other notable figures in world literature and drama.

Drawings by AUSTIN EUGENE BRIGGS

Archway in one of Tarascon's ancient walls.

But, strangely, Tarascon is 'undiscovered.' Daudet has made Tartarin and his Tarascon so unbelievably and audaciously 'real' that nobody will believe that it exists. Naturally, then, nobody thinks of going to a place that does not exist in reality; so they don't. Baedeker gives it but a few lines; travel writers seem generally to have ignored it. And Tarascon seems well satisfied with this neglect, since it has never forgotten nor forgiven Daudet for his ruthless words.

Tarascon does exist nevertheless. Tartarin still lives in Tarascon in the persons of its few thousand inhabitants and altogether a visit is like turning over and rereading the leaves of Daudet. But it is infinitely more medieval than Daudet made it.

You can prowl about the town for hours and completely forget that Columbus ever discovered America. You will find yourself strolling through tortuous streets with drunkenly leaning houses and bulging windows like glaring eyes that remind you of those streets and houses you saw in *The Golem*. Everything in sight is centuries old: signs, street lamps and buildings.

You find yourself walking about the old crumbling town walls with their bastioned gateways that had withstood a thousand sieges before Napoleon was born, peering into alleyways that held dread secrets in the time of Benvenuto Cellini and stumbling upon a parish church part of which had stood there for more than a thousand years! A little farther on you pass through an archway that must have felt the prick of hostile arrows in its early days, and come smack up against the finest medieval castle in this part of France. It is the chateau of King Réné of Anjou.

You go back to your hotel wondering who the deuce you would have been, or *are*, in this great big natural-born movie-set you have discovered several thousand miles away from Hollywood.

Entrance to one of the two motion picture theaters in Tarascon.

It all seems like a great romance in which you are playing a double rôle of actor and spectator. The romance is sustained by Tartarin, the proprietor of the hotel, hovering around you in his carpet slippers and personally superintending the serving of the savory potage and the delicious sauces, the perfect wines and the creamy cheese *de la pays*. The romance continues when a bill is handed you for 12 francs *vin compris*—about 45 cents!

Supper over, Tartarin and Therese his wife, exhibit a pleasant excitement of anticipation. We ask what the excitement is about? And learn that they are going to the movies!

Going to the movies in this sleepy medieval town miles from nowhere! These stupid French *Provencals* trying to be up-to-date enough to comprehend and enjoy the 20th (Concluded on page 2

MR. FORD'S PAGE

OF THE DEARBORN INDEPENDENT

LAST week we spoke of the Hand as one of the extensions or implements of the mind, an avenue through which the mind makes contact with the world. We may put it this way: as the brain is the organ of the mind, so the Hand may be said to be the organ of the brain. The Hand commonly would be called a limb, and not an organ, but when we consider that it has been estimated that 90 per cent of the elements of education are conveyed to the brain by the Hand, we are justified in referring to it as the organ of intelligence.

More than that, we are justified in referring to the Hand, as we did last week, as 'the most important implement of the mind.' Comparisons are always risky, and when one compares the Hand with the eye or ear or tongue, it seems to sink in importance. We readily observe this in education, for our schools are almost wholly devoted to the Eye and Ear. Yet it is against this almost unanimous agreement to rate the Hand so lowly that modern science sets up the claim, and proves it, that the Hand is, first of all, unequaled as a factor in the education of the individual, and, second, unequaled in its range as an instrument of the mind's expression.

To state it simply, the Hand is the most important road *into* and the most important road *out of* the mind. More *impressions* reach the mind through the hand than through any other organ or sense; more expressions reach the world from the mind through the Hand than through any other human channel.

Of course, a statement like this falls within the criticism of personal experience, that is, one can determine for oneself by careful observation whether it is true. In fact, it is only by careful observation, by tracing to their sources all the elements of the individual's education, that the Hand has been lifted from its obscurity as an educational factor. And from time to time we shall be giving in this Page, and elsewhere in this magazine, illustrations and instances which confirm what has just been said.

When we can say that people can speak with the Hand, hear with the Hand and partially see with the Hand, as in the case of Miss Helen Keller, but that no one has yet seen with the ear nor heard with the eye, it should not be difficult to perceive that the Hand assumes a much more important place than we have assigned it.

THE Hand is of primary importance in reaching the results all good educators seek. It is estimated that 90 per cent of the elements of education are conveyed to the brain by the Hand. It may therefore be called the organ of intelligence. At the same time the Hand is an instrument of the mind's ***expression,*** *but more* ***impressions*** *reach the mind through the Hand than through any other human channel. No one is really educated unless the hand is a factor in that education. Through the eye a man may read all that has ever been written, but he will never get to the heart of things except by contact and action.*

The point which we shall be content to urge at present is that educators must begin to consider, as indeed many of them already do, the prime importance of the Hand in attaining the results which all good educators seek.

We are not speaking of 'manual training' or anything like that. We are not resting at the point reached by trades schools. We are not insisting that the main benefit of hand-training is industrial, that it will supply men with trades and trades with men. All these are considerations by the way. What we are insisting on is this: *the individual is not educated unless the Hand is brought into the process.*

He learns light, color and form through the eye. He contacts the tone-world through the ear. But where does he learn the things which learning is supposed to give him, such as accuracy, the inherent law of things, application, initiative, the law of effort, judgment, ingenuity, ability? These are the things which mark an educated man. Through the eye he may be enabled to *read* all that has ever been written, but he will never *know* anything except by contact and action. And what he *knows* is valuable because it begets in him the precious values just mentioned—accuracy, honesty, knowledge of the law of things, application, initiative, effort, judgment, ingenuity, ability—without which no man can be described as 'educated.' These qualities are not book qualities at all; they are Hand qualities, and come to the individual largely through the Hand.

A sewing teacher has just said that her most successful pupils are those who have become skilled in piano before taking up sewing. She says the perfect teamwork between mind and muscle is incomparably above that of pupils who have had no instruction or use of the Hand.

That is a very humble example of the Hand as the vehicle of those influences and factors which go to form an education. To fancy that the 'brain' can be educated and the body left uneducated is the chief educational fallacy of the age. It has resulted in serious intellectual deformities everywhere, but especially in those spheres which consider themselves *most* 'intellectual.'

Many diverging lines of suggestion and significance radiate from this neglected truth about the Hand, which will require that we return from time to time to this important subject.

Nitrates or Battle Cruisers?

'It was not a purposeless adventure that brought Admiral von Spee's fleet across the Pacific to destroy the squadron under the command of Admiral Craddock in the battle of Coronel off the nitrate coast. To strike at the source of the allies' nitrate supply was to paralyze the armies in France.'—Clarkson—*Industrial America in the World War.*

THE first naval battle of the World War was fought off the nitrate coast of Chile October 22, 1914. Admiral von Spee, with a squadron of five German cruisers, won a complete victory over Admiral Craddock of the British Navy, sinking the British cruisers, the *Good Hope*, the *Monmouth*, and later, the *Otranto*, the cruiser *Glasgow* escaping by a scratch.

In the face of this naval nitrate lesson it is proposed to build ten new cruisers costing $140,000,000 to $150,000,000 and leave the Government's nitrate plant at Muscle Shoals standing idle—*the only plant of its kind idle in the world.*

Must we have cruiser defense costing $150,000,000 *and no nitrates* for national defense and for fertilizers, when *we can have both* at practically no additional cost at all?

The Joint Committee on Muscle Shoals recommended the Power Combine's offer proposing to build a new air nitrogen fixation plant at Muscle Shoals estimated to cost from $15,000,000 to $20,000,000. The chairman of the Joint Committee has recently, on the floor of the Senate, urged the acceptance of the Power Combine's offer, but he did not explain to the farmers of the country nor give any reason why they should pay $1,000,000 a year interest on a new nitrate plant to cost the farmers some $50,000,000 in fifty years. This is a needless capitalization, and, as we have said before, it is a betrayal of the farmer in favor of the financier. We still refuse to believe that the President will approve any offer for Muscle Shoals that will permit such unfair and unnecessary capitalization, or that he will permit bankers to collect interest from power consumers on the regulated flow of the Tennessee River to the tune of $1,800,000 annually. We cannot believe that the President will allow the Government to be a partner in a watered stock scheme that ignores nitrates and national defense and betrays the farmer.

At Seattle, Secretary Hoover, discussing a national policy for the development of our water resources, cited the Tennessee and Cumberland rivers, where, he said, with adequate headwater storage provided there can be developed 3,000,000 horsepower. The Secretary of Commerce truly said:

'The devotion of a large part of the power which could be created here for the development of the electrochemical industry is a national necessity for industry, agriculture and for defense.'

This statement goes to the root of the national problems before the President and Congress on the Tennessee River, but how is a large part of this power on the Tennessee and Cumberland rivers to be devoted to the electrochemical industry if the American Super Power Company, and its subsidiaries and allies, are to be given all of the dams on the Tennessee—and they demand all of them—and if all of the dam sites on the Cumberland are to be given to the Insull subsidiaries, and they have applied for all of them. The President must now make his choice between the Power Combine and the welfare of the nation, and Congress must decide whether it will stand on the side of the power barons who are financial influences in Senatorial primaries, or on the side of the farmers of the country who pay high prices for fertilizers.

Governor Smith, of New York, has furnished the country an example in his efforts to protect the rights of the people of his state on the St. Lawrence River. Governor Peay, of Tennessee, on the other hand, has shown sympathy with the desires of the Power Combine on the Tennessee River. Governor Smith stopped the Power Commission of his state from giving away the power on the St. Lawrence River to the American Super Power Company. Governor Peay urges the Federal Power Commission to make a gift of $50,000,000 to the American Super Power Company on the Tennessee River. For that is precisely what a perpetual permit for the Cove Creek dam, a tributary of the Tennessee, means. The American Super Power Company, which controls the thirteen power companies making an offer for Muscle Shoals, knows the value of Cove Creek, but does the public know? The American Super Power Company knows better than the public that it already controls the power at Muscle Shoals and that there are two ways to confirm that control—one for Congress to accept the Power Combine's offer, and the other, for Congress to adopt a plan of Government operation at Muscle Shoals. *Either way will be acceptable to the Power Combine.* The real goal and objective of the Power Combine at this time is the Cove Creek reservoir dam. The Power Combine knows that the Cove Creek reservoir dam is worth $50,000,000, and perhaps $100,000,000 and the Combine knows that *this dam belongs to the people of Tennessee*, yet the Combine asks the Federal Power Commission to make a gift to them of Cove Creek, and Governor Peay approves.

Whenever the right is granted by any executive of the Government, or by the Power Commission, or by Congress, to any power company to build and own the Cove Creek dam under the Water Power Act, that will be a gift of $50,000,000 to the Power Combine.

Is This Prosperity?

AT THE beginning of a New Year, any New Year, one makes a choice of falling in with the rosy optimists, or taking the road of common sense. As a rule the loudest insistence upon 'prosperity' comes from those who are so fixed that they will be prosperous whether anyone else is or no. It is no true evidence of the fact that politicians insist that the country is prosperous. In doing so they are only pandering to a popular superstition, carefully cultivated by politicians, that it is politics that makes times good or bad. The politicians have as much affect upon times as they have upon the weather. The prosperity chorus that comes from Washington is strictly political; more than that, it is strictly partisan.

It is not prosperity when people are merely spending their money. That is a purely banking and mercantile kind of prosperity, and not economic prosperity at all. American people always spend their last dollar with the air of having plenty more where that came from, so that generally speaking we may seem highly prosperous one week, and inexplicably slack the next. Those who know the extent of the people's money stock can yell prosperity up to the last minute, and so continue the flow of spending. But it is doubtful if by this course they are conserving the true prosperity of the country.

Prosperity does not consist in the number of sales which installment companies are making. These are not sales at all; they are debts; debts laid upon the purchaser of the goods, debts laid upon the credit companies who borrow from the banks to lend to the purchaser. For ultimately there is no installment selling; the manufacturer always receives cash; there is only installment buying, the installment lure catches only the poor purchaser. One can judge what a vast multitude of poor buyers there are, when one estimates the hundreds of millions of dollars loaned by banks to credit houses to entice the people into debt. And as most of this business is forced, it is fallacious; and as most of it is unpaid, it is a menace and not a bulwark to prosperity. Those who have maintained that prosperity is mainly a psychological condition have apparently not measured the capacity for fear, foreboding, distrust and collapse inherent in this systematic and specialized method of tying the entire buying public to a debt that more than equals income—a sure and certain debt against a most uncertain income.

There are too many questionable tendencies abroad in the nation for anyone to greet the New Year with naïve insouciance. And the temptation is strong to believe that many of the loudest shouters of a false prosperity doctrine are simply interested in the public's last dollar and not in the security and extension of the public income. That is the basic insincerity of it all.

Prosperity means this: that every hand has its work, and every work an honest wage, and every wage a sufficiency for the durable and helpful things of life, and every family a measure of economic security. It is a question worth asking: Is economic security less or more than it was two or three centuries ago? We know that wealth is more, that opportunity has multiplied, but is security increased? If it were, there would seem to be less anxiety in the politicians' chorus of prosperity.

Mexico—Money—Monopoly

WHO is talking to Mexico from Washington? Old man Money. It may seem to be the Secretary of State, but it is not. Certainly it is not the American People. The People have not said a word to Mexico, yet much has been said. It is Money that talks, Money that seeks a Monopoly of Mexico's resources.

When John Citizen of the United States is bade get ready to shoulder a musket and march down to Mexico, who so bids him? Money. Money is always sending young men somewhere to fight and die—Money and Monopoly.

American Money invested in Mexico represents more than quarter of the national wealth of Mexico. And *who* is American Money? The financial interests most heavily interested in that country. You should read the list and see whether you want to go down with a rifle and subdue Mexico for them. Read the list!

Kuhn, Loeb & Co.
Speyer & Co.
Hallgarten & Co.
William Salomon & Co.
Ladenburg, Thalmann & Co.
The Guggenheim interests.

All fine old American names, inspired with the purest patriotism. Trailing along with them the Mellon interests and the Morgan interests.

Altogether there are One Billion Three Hundred Million American Dollars talking 'Mexican Crisis,' but not a single American Citizen.

Who Is Guilty?

IT MAY be interesting to know whether Mr. Fall really has that $100,000 which Mr. Doheny gave him, but it is more than interesting, it is indeed extremely important, to know who has the Navy's oil.

The case against Mr. Fall and Mr. Doheny was presented in such a way that no self-respecting jury could do other than acquit them. It is not to be expected that a jury would usurp the functions of the prosecutor. For that reason we dissent from all disapproval of the jury, and invite the outspoken Congressional critics to direct their fire elsewhere.

Mr. Fall and Mr. Doheny, at best, are incidents. The jury has said they are not guilty, but it could not exonerate the Government. The Government is guilty all the way along. It has been convicted of neglecting its own affairs and of failing to safeguard important public rights. Oil companies cannot very well be blamed for acting like oil companies, but a Government can be blamed for not acting like a Government.

New York *and* Prohibition—
When Victory Meant Defeat

YOU have read that the state of New York, at the November election, went wet to the tune of three or four to one. Believing the newspapers, as you do, you believe this statement to be true. Nevertheless you may be interested to learn what actually took place in the state of New York on election day last November.

New York State, last November, cast 2,780,683 votes for the various candidates for governor.

Of this number of persons who we know went to the polls, 1,685,489 voted for booze on the liquor referendum. Those who voted against booze numbered only 543,920. The number who voted for booze was more than three times as great as the number who voted against it. This is the whole basis for the statement you have read so many times, that the state of New York went for booze by a vote of more than three to one.

But the vote does not tell the story. It tells only *how many wets there are in the state* because the wets were urged by their leaders to come out and vote and they did come out. But *the drys were urged not to vote.* Their leaders asked them to take no part in the referendum. Not all of the drys accepted the suggestion. Obviously the 543,920 who voted no on the referendum did not accept it.

How many drys accepted the suggestion and took no part in the referendum?

There is a way of finding out. You know how many persons went to the polls. The combined vote for governor tells you that—2,780,683. You know how many voted on the referendum—2,229,409. Of those who went to the polls, 551,274 did not vote on the referendum. It is only common sense to say that those who appeared at the polls, yet did not vote on the liquor referendum, were drys. There is no known instance of a wet ever failing to vote for booze at every opportunity. Only the drys were urged to keep away.

SO WE are unquestionably justified in adding to the dry vote the number who went to the polls but did not vote on the referendum. The dry vote was 543,920. The number who did not vote was 551,274. The sum of these two figures is 1,095,194. That is the dry population of New York, in so far as the November election revealed it.

We now come in sight of some facts. With every wet voting at least once, the wets were able to muster 1,685,489 votes in favor of booze. The dry vote—cast and uncast—was 1,095,194. A majority for the wets, on the face of the November election, of 590,295.

You do not yet have the whole story. Almost 600,000, even in a great state like New York, is quite a majority. It is a big vote. But it is not four to one. It is not three to one. It is not even two to one. It is more like one and a half to one—a good vote, but nothing to write home about.

Both candidates for governor were wet. The Republican candidate, Ogden Mills, added to his wetness the fact that he was running on a dry platform. He was a little more objectionable to the drys than Al Smith, who was at least consistent and outspoken in his advocacy of looser liquor and more of it.

BOTH candidates for United States Senator were wet. The Republican candidate had been dry and become wet. He was too wet for the drys and too dry for the wets. The most the drys could do was to draw to a third ticket enough Republican votes to defeat Wadsworth, and they did that.

Many drys stayed at home and did not vote at all.

How many remained at home? How do we know that anybody remained at home? There are ways of knowing. Figures smoke out the facts.

The total vote for governor, at the recent election, was 2,780,683. With all candidates of both parties standing for booze and urging their followers to come out, that figure was the best they could do.

In 1924, the combined vote for governor was 3,244,839 and the combined vote for presidential candidates was 3,255,637. Taking the presidential vote as a basis of calculation, we may say that at least 474,954 voters remained away from the polls at the recent election. This figure represents the difference between the gubernatorial vote in 1926 and the presidential vote in 1924. New York has not shrunken any since then. On the contrary, it has grown. The wets, in 1926, needed no urging to go to the polls, yet they were urged—and the gubernatorial vote showed a falling off of 464,156 over the gubernatorial vote of 1924, and a falling off of 474,956 as compared with the presidential vote of 1924.

What is the next step? Add to the dry vote, as revealed by the November election, the number who were so disgusted that they did not vote at all. What was the dry vote, cast and uncast? Just 1,095,194.

Add to this the number who did not vote at all—474,954. The figure we get is 1,520,148.

That is the minimum dry vote of New York, which we must contrast with the maximum wet vote cast last fall—and everybody who lives in New York knows that it *was* the maximum vote—of 1,685,489.

The real wet majority in the state of New York is therefore 165,341 in a total vote of 2,780,683. The wets were able to muster a majority of only 165,341—not much of a majority. Nothing to get excited about. And this in one of the wettest states in the Union.

What a tremendous number of drys must be scattered through the state of New York so nearly to equal the hordes of foreigners in New York and the other great cities who always vote wet!

New York City is so crowded with foreigners that it does not look like an American city. They all voted wet. But in the wettest state of the Union the drys almost met the wets man for man.

No wonder the liquor interests had to lie about the New York election. They did not dare face the truth. The only thing to do was to get in their lie first and whoop it across the country. The whole New York liquor referendum was nothing but a piece of liquor propaganda anyway, and the only way to cash in on the propaganda was to make the country ring with reports of a great wet victory. It made no difference that the reports were false. Anything is good if it can be made to stick. The newspapers did their best to make the lies stick. They are doing it to this day. They will continue to do it as long as they can find anybody who will believe them.

BUT the facts—nobody can get away from them. The great liquor victory in New York was a great liquor defeat. It would have been a victory in Kansas or Arizona, but it was a defeat in New York. Nobody ever claimed that New York was dry. It contains too many foreigners to be dry. But nobody ever suspected that it is as nearly dry as it is. A margin of 165,341 in a voting population of more than three and a quarter millions is a small margin. It is a dangerously small margin, so far as the liquor interests are concerned, when one considers New York's great foreign population. It is dangerous because it so plainly indicates how dry are almost all the other states of the Union.

Happy New Year in CHINA

Means That All Must Pay Their Debts

By L. M. CRAMER

THOUSANDS of ancestors slumbered in their graves, unhonored and unheartened by the sound of exploding firecrackers on China's New Year's Day. In all the hundreds of years that some of them had lain buried in and about Nanking, this was perhaps the first time no male descendant had worshiped at their grave on this day. In China the living go to the grave mounds of their dead on China's New Year's Day to pay their respects.

It was because of those noisy popping firecrackers that General Han, civil governor of Nanking, had forbade the firing of a single one; they might be mistaken for machine guns and start war.

Of course Occidentals may laugh at the idea of the popping of firecrackers on top of ugly grave mounds starting war. But there is, in China's recent history, something even more unbelievable. In 1921 one war was actually started by a soldier beating a tattoo on an empty oil can which bore the single word, 'Socony' (Standard Oil Company of New York). It was one of General Chang Tso-lin's soldiers who beat that tattoo, and General Wu Pei-fu's black regiment, which had been ordered not to fire till fired upon, immediately opened fire on the enemy, claiming they thought the tattoo was machine-gun fire. Popping firecrackers would have been every bit as good an excuse for some overanxious soldier to have started a battle as was a tattoo beaten on an empty Socony tin.

That was why the dead were not heartened on New Year's Day by the sound of popping 'devil chasers.' That was why no paper money was burned at their grave mounds.

A few days before the Chinese New Year, every house in Nanking was swept and dusted. Bedding was washed, and new clothing was purchased whenever possible. The poorer classes save their money for the entire year, just to spend it at New Year's time. Faces of the coolie children, many of them unwashed probably since the last New Year, were scrubbed till they shone, and the matted pigtail of the carrier coolie was brushed and combed and rebraided. Food was prepared in amazing quantities—even the poorest had a meal a bit above his ordinary fare.

Seven days before, the kitchen god had been sent on his fiery way to the Pearly Emperor to report. His mouth had been firmly sealed with a sticky rice cake, that he might tell only the sweet things of his hosts of the fast-dying year. Sometimes, when a host realized that there was too much that was bad which the kitchen god might tell, his paper mouth was smeared either with wine, that he might appear before the Pearly Emperor in a drunken condition, thus bringing discredit upon anything he might tell, or with opium, that he might fall into slumber and be unable to talk.

For five days before the morning of the New Year, people were very careful of their speech; their tongue was at all times guarded, for it is on the fifth day before the coming of the New Year that the gods descend from heaven to inspect the people. What they see and hear determines what measure of happiness or misery they will mete out to the different families during the ensuing year.

On the last day of the year, called *San shih won shan*, the business man works long hours, checking his accounts, and collecting and paying bills. All night the street lamps are burning, and messenger boys and clerks from the different shops rush hither and thither carrying lanterns, (Concluded on page 24)

Celebration of the Chinese New Year's Day in Canton.

The Things I Should Do IF I Were in COLLEGE Again

By THOMAS ARKLE CLARK

SOMETIMES, when the winter night is cold and the storm outside beats against the house, and the wood fire inside burns cheerfully, I sit meditating as I look into the flames, and think over a not too well-employed past. I go over in my mind the years that separate me from my college days, and foolishly I wish that I might repeat the experiences of my undergraduate life. Sometimes I plan the things that I should do if I had the chance to live over again those pleasant days, and, like all men of middle age, I cherish the flattering hallucination that if I were granted the privilege of traveling the road of youth once more I should do it in a different way than I did the first time, and I should do it more successfully. Like most people, I am periodically given to regretting my neglected opportunities and my disappearing youth.

It gives one a very virtuous feeling in imagination to dodge all error, but it is extremely doubtful if many of us, even if we had a second chance, would avoid many of the pitfalls into which we stumbled, or follow a straighter path than that by which we have so far come. It merely gives us pleasure to conjecture what we should do if we had a second try at it, and it is barely possible that it may not do harm to the young people who may happen to listen to us.

'If I were given a second chance I should try to develop concentration.'

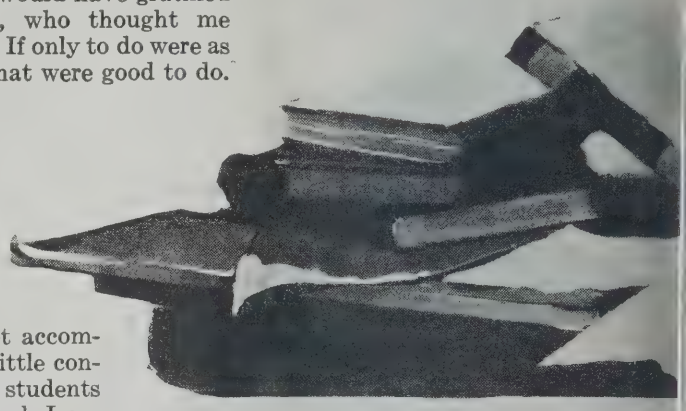
As I sit by the fire I can see clearly how I might have avoided all the errors into which I as an unsophisticated undergraduate innocently fell—how I might have won athletic honors which in reality never even came close enough to tempt me; how I might have become a clever writer and an attractive and ready speaker; how I might have carried off class honors which would have astounded the neighbors at home, who looked upon me as a very ordinary mortal, and which would have gratified my near relatives, who thought me quite the contrary. If only to do were as easy as to know what were good to do.

It seems to me now that if I were in college again I should not work so many hours as I did. I was not lazy; I put in enough time with my book in my hand, but I did not accomplish much; I had little concentration. Many students whom I know, though I am not sure that the practice is confined to students, spend a good deal of time in getting ready to work. With a book in hand and a feeling of virtuous satisfaction in their hearts, they look out of the window at the clouds, or at the pretty girls passing along the street, and all the time they deceive themselves with the idea that they are studying.

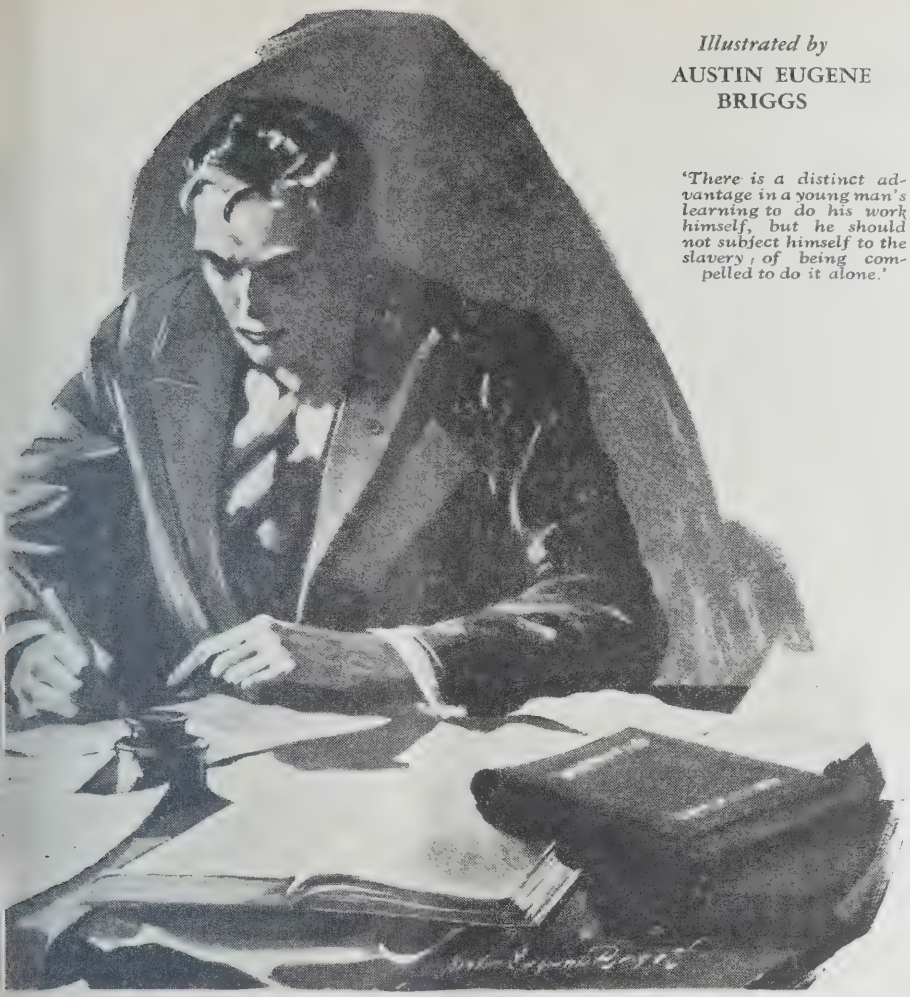
George Ade's characterization of the attitude of students toward matrimony—they don't marry; they just fool 'round—might be applied with equal appropriateness to their method of study. They don't study; they just fool 'round.

Many an evening, when the work was heavy, I would determine to begin early and get it over with. But I could spend half an hour in looking for my pipe, and in getting it filled and going well, and another half-hour in arranging my books, and getting myself seated in a comfortable chair, and all this time I imagined I was working. I spent as much time in goading myself on t duties that I should have liked t shirk, or in getting ready to work, a I did in actual labor. I did not realiz that having a plan, and getting t work with a rush and vim, is ofte half the battle. If I were given second chance I should try to develo concentration—I should work harde but not so long.

If I were in college again I shou



learn to work with people about m As it was, I lived a somewhat isolat life. I was one of the unfortunates for so I have come to look upon them who live at home while they go t college, and this fact shut me off fro some of the most valuable associatio with men, and took from me no lit of the independence of action whi the college student away from ho soon develops. I remember that I w always congratulated on being able enjoy the 'comforts of home,' and did not then realize what I have sin come to know, that not many you fellows under such circumstances well in college. I did my reading a my studying alone, and though the are some advantages in this metho there are also most serious objectio Now I must often work under ve different conditions from those which I was surrounded in college. I have work which must be done an noise and commotion, and I do t under those conditions with difficul As I tried upon a crowded railw train to put upon paper these wand ing thoughts, I was constantly annoy by the confusion about me, and by te spasmodic attempts at conversatn made by a well-intentioned but mi guided young man at my side. I I had learned to work under differ t



Illustrated by
AUSTIN EUGENE BRIGGS

'There is a distinct advantage in a young man's learning to do his work himself, but he should not subject himself to the slavery of being compelled to do it alone.'

nditions, I might have turned the nversation aside as a steep roof sheds e rain. I am sure there is a distinct lvantage in a young man's learning to his work *himself*, but he should not ubject himself to the slavery of being mpelled to do it *alone*.

I am sure, too, that I should go at y work with a very different purpose mind than that which I had when, as a eager, untrained country lad, I me to college. It was facts I wanted en—I had no thought of training. the work which I had been doing I d often been at sea as regards inciples and problems, and I had t yet come to realize that the knowlge of how to get information is often r more desirable than the information self; that the training of the mind is tter than the storing of the memory ith facts.

F I had my work to do over again should do more difficult things, or ings for which I have no special ndness. I like an easy time as well any one, and I have the greatest mpathy for the fellow who occasionly finds little inspiration in hard ork; but it is this very hard work hich we find so uncomfortable, and so sagreeable, out of which we get the eatest development of our powers. I do not wish to give the impression that I think it an error for a student to follow the profession he enjoys, or to do the work he likes. In point of fact, I believe that a student should choose to follow those lines of work along which his tastes lead him. Those things we do most easily we shall very likely do best, but I have found that training comes through struggle, and that those people are developed most who resist most, or who fight against difficulty and opposition, and overcome. I have known a good many geniuses, but they generally had the most commonplace careers, because they never could bring themselves to do difficult or disagreeable things. Students come into my office every day who want to get out of work, or to drop a subject, or to cut a class exercise, for no better reason than that they find the duty difficult, or the instructor or the subject dull.

Half the things I am forced to do during the busy days of the college year are things I naturally dislike doing, but I have been obliged to give these things my best attention whether I like them or not. I wish I had learned while in college to do more such things.

Just yesterday as I was sitting at the breakfast table talking to a young freshman, in whom I have a rather vital interest, as to his next year's course, I suggested a subject which I thought good for him to take. 'Is it easy?' was his first question. 'Going to have any snap courses this semester?' a frank, light-hearted junior quite shamelessly asked me last week. In the world in which I do my work today I have found few easy roads, few snap courses. We are all forced to do a great many hard things. I wish I had learned to do more of such things early.

LIKE a great many people, I suppose, I am not now doing the work that as a college student I planned to do. I am in no sense a fatalist, but I am convinced that men have their work chosen for them quite as often as they themselves choose it. The best chemist among my classmates is now an evangelist, one of the enthusiastic engineers is a missionary in India, while the man who was most determined on the extermination of the heathen has settled down to a quiet life on the farm. And I, if I had suspected that I should be called upon to speak upon the most unforeseen occasions, should have given myself while in college the practice which I believe is the method everyone must employ if he is to become a ready speaker. *(Continued on page 20)*

'The conception in college is that the instructor is a somewhat abnormal being.'

There IS Something in This *Art Stuff*

By It *the* Character *of* Nations Is Shown

By GAIUS GLENN ATKINS

THERE are six miles of gallery in the Louvre—on the authority of a guide who stands on the left of the steps where the cabs stop—say a mile and a half of pictures, two miles of statuary, much of it in bad repair, and the rest what you will, from such remnants of the crown jewels of France as escaped the Revolution to models of sailing craft from the Roman galley down. From the Louvre as a base line and making due imaginary calculations, I should say that Europe has art enough on public display to reach from the Grand Central Station in New York to Greenwich, Connecticut—and most of it worth seeing.

Seeing it is another matter; picture gazing by the mile is hard work. The Rubens in the Louvre might be done on a bicycle, but the natural conservatism of the French makes this impracticable. Rolling chairs would be a fair compromise but the effete civilizations of the Old World are slow to take over the methods of Atlantic City and Palm Beach; the galleries still have to be seen on foot. They can be done alone, in parties with a conductor, with a local guidebook, or by the light of nature, and all these methods are employed by visiting Americans with various personal reactions which still await scientific tabulation.

If you go in a party you do selected portions of the six miles in the Louvre, say, in two hours or under, at an average rate of two miles an hour, which is exactly what Baedeker allows for walking through Switzerland. An itinerary for such a tour would be about as follows:

'At the top of the first

—*Ewing Galloway Photo.*

—*Publishers' Photo Service.*

A gallery in the Louvre. Above—Gallery of Venuses in the Louvre, with the famous Milo in the center.

The 'Marriage at Cana,' by Paul Veronese.

—Print by courtesy of the New York Public Library.

ight of stairs turn to the left, thence own through corridor, five minutes, o the Venus de Milo at end of passage. Notice the Three Graces and various tatues of Aphrodite and Apollo on ther side. Return, through room of oman antiquities, seven minutes, and ake second flight of stairs to Winged ictory. Thence, two minutes, past ounters for sale of photographs and icture postal cards and Ingres' La ource to Salon Carré. Notice splendid xamples of Raphael, Correggio, Paul eronese, Guido Reni and Titian; best iew to the left.

'We now go, fifteen minutes, past a Vinci's "Madonna of the Rocks," Bacchus" and "John the Baptist" to Mona Lisa"—best view still to the left. fter a group of Raphaels, three inutes, the Murillos appear and the isitor is advised to notice the famous Immaculate Conception" and "Birth the Virgin" and the charming Angels in the Kitchen." Thence, ighteen minutes, past the Rembrandts nd other choice examples of the Dutch hool, to Van Dyke's "Charles the irst" and thence, twenty minutes, oing and return, past the allegorical aintings of Rubens. Side excursions ould be made on the return to the alleries of the French school and the rly Italian. Motor buses will be aiting at the door for the tombs of apoleon and the Unknown Soldier.'

More independent tourists take ne of the guides who offers himself ith becoming modesty at the entrance the gallery, and gives you a private, ersonally conducted tour. The aver- ge guide is a curious mixture of in- rmation and misinformation. He will give you the backstairs gossip of art and take care that you see the best pictures, though he will not or cannot tell you why they are best.

Well-trained American husbands follow their wives. Those earnest-minded ladies have been studying for years in the Neighbors, the Chatterie or some other woman's club which makes a specialty of art, history, home travel, gossip and tea; they know exactly what they want to see and they go straight to it with a look of determination which leaves their husbands literally and figuratively in the rear.

A docile president of the bank back home, being towed through the Louvre or the Uffizzi by the wife of his bosom and a polyglot guide, deserves more sympathy than he commonly gets. If he were left to follow his own natural impulse he would study art in its more animated and contemporaneous forms at the Folies-Bergére.

For these great canvases which are the priceless treasures of the old-world capitals need a deal of living with before you begin to see why they are there at all. The painter who did them must have had something; so much becomes apparent as you watch the expert copyists whose easels are a better guide to the masterpieces than most of the guides. The copyist gets the pictures but the untrained eye can see that something is wanting, some magic of light and shade, some fluid smoothness of brush work, some golden glow, something as elusive as atmosphere, as intangible as sunlight through mist.

The deep, rich coloring of old pictures, forgetting the vivid Italian for a moment, is one of the things which meets you on the very threshold of a great gallery.

I remember entering the Ruyks Musee in Antwerp of a dull afternoon when the whole place seemed aglow with a somber golden light coming from the canvases themselves. Something of this is doubtless due to many varnishings, but more of it to a skill in the mixing of colors which mellow with the years, and the rest, which is most of all, to the artist's touch, the thing which was all his own and which no reproduction can catch.

There is no denying a monotony of theme in any great gallery. The Church was the first great patron of the arts, especially in Italy, and the natural devotion of the artist, combined with the necessities of patronage, combined to make all art down to the Renaissance religious.

We naturally expect a picture to tell a story, and these pictures tell no story save the familiar and the conventionalized. They are compositions, not narratives, and it is only when we begin to see the significance of the composition that we begin to take in art. It is, after all, just the difference between a tune and harmony done in color instead of tone. There is in all such pictures a strange mingling of the temporal and the timeless, the childish and the mature. There are camels, painted by men who never saw a camel, with impossible heads and necks; elephants who have teeth in the ends of their trunks; and ladies by Botticelli who are the very spirit of a misty spring morning, but under their

diaphanous gowns is a better testimony to the artist's innocence than his knowledge of the way the human form is put together.

Historical consistency means nothing to a Paul Veronese. His 'Marriage at Cana' is set in Corinthian columns and a Roman palace. His men and women are clad in silks and brocaded velvets, and Jesus and His mother sit at a table which a doge might have spread in Venice. The musicians are portraits of Venetian painters and Veronese himself plays on the viol.

Such things as these try the literal minded. When a picture neither tells a story which appeals to the imagination—always assuming you have lost or never had the particular imagination to which it did appeal—and does not even tell the truth in detail, and has no originality in theme and is drawn like a gifted child would draw, what are you going to do about it?

Meanwhile outside there are the boulevards of Paris, or the Tuscan hills and the Arno under an old bridge lined with little shops where you may get cameos and beads for lira worth 25 to the dollar.

It is safe to assume, to begin with, that every canvas has a well-won and long-tested right to its place upon the wall. These galleries are the sifted substance of 500 years of painting. They are there by the common consent of the art experts of the world from their own time to ours, and this is a verdict not lightly to be set aside. They are the creations of a genius so rare that a single artist may make his generation or his country famous, or a hundred years go by with no substantial addition to the galleries of the acknowledged masters. They are so priceless that money cannot buy them. England would sell her navy as soon as her Turners; Holland her dikes as soon as her Rembrandts. Why?

If you are fortunate enough to have a companion who really knows what makes a great picture he will tell you how many elements combine to win a place in the company of the immortals.

The early Italians, as I have said, naturally chose religious themes; many of the pictures now in the galleries were originally in churches. After the Renaissance the Italians were under the spell of the beauty of the human form, the rediscovery of the splendor of life and the classic tradition. Michael Angelo, the master of them all, combined the devotion of the Catholics with an almost pagan joy in the purely physical, and calls up his souls to their last judgment unclothed and splendid.

The Dutch paint homely human things perhaps because their little land offered no wealth of landscape, their native puritanism forbade the unclothed, and their Reformation had broken with the old traditions of the Church. So they give us interiors of their houses with a gleam of light through a clear window, caught and reflected on a copper pot or a woman's face, or else some fields of grain and a rutted road and windbent trees and a wash of watery sunshine across it all, or else the faces of old men and women with all their lines and some haunting look in their eyes, nameless symbols of our general humanity worn by time and common fortune. The later Flemish painters show us coarse feasting and overladen tables and the sensely pleasures of their age with a relentless brush, but the very humanness of Dutch art gives it an appeal to which the student of the galleries is likely to respond before he gets a proper feeling for the Italian.

—*Print by courtesy of the New York Public Library.*

Rubens' 'The Descent From the Cross,' in the transept of Antwerp Cathedral.

The English love to paint the story pictures like Luke Fildes' 'Physician,' a copy of which hangs in most doctors' offices, very likely a present from some grateful patient with a sense of the fitness of things; or Millais' 'The Eve of St. Bartholomew's.' They paint horses and dogs with the fidelity of Landseer's brush, or poverty and carnality with the realism of Hogarth. Watts is the great symbolist of the 19th Century, and Turner belongs at his best to the chosen group of no time or place.

The French have always a dramatic touch and make much of battles and the long events of their brilliant and tragic history, with a flair for the nude which may be anything from pure beauty to a frank appeal to the flesh.

Thus, the subjects which an artist selects are themes determined for him partly by tradition, partly by the temper of his time, the necessities of patronage—for an artist must sell his pictures, though most of them protest that they don't want to—and greatly by his own natural genius. He paints what he sees and what seizes him, the one event of the history of his land or the devotion of his church, or the old adventures—not always reputable—of the gods and goddesses, or a face in the crowd, or a landscape he knows, or a king on horseback, or a beggar boy hunting fleas.

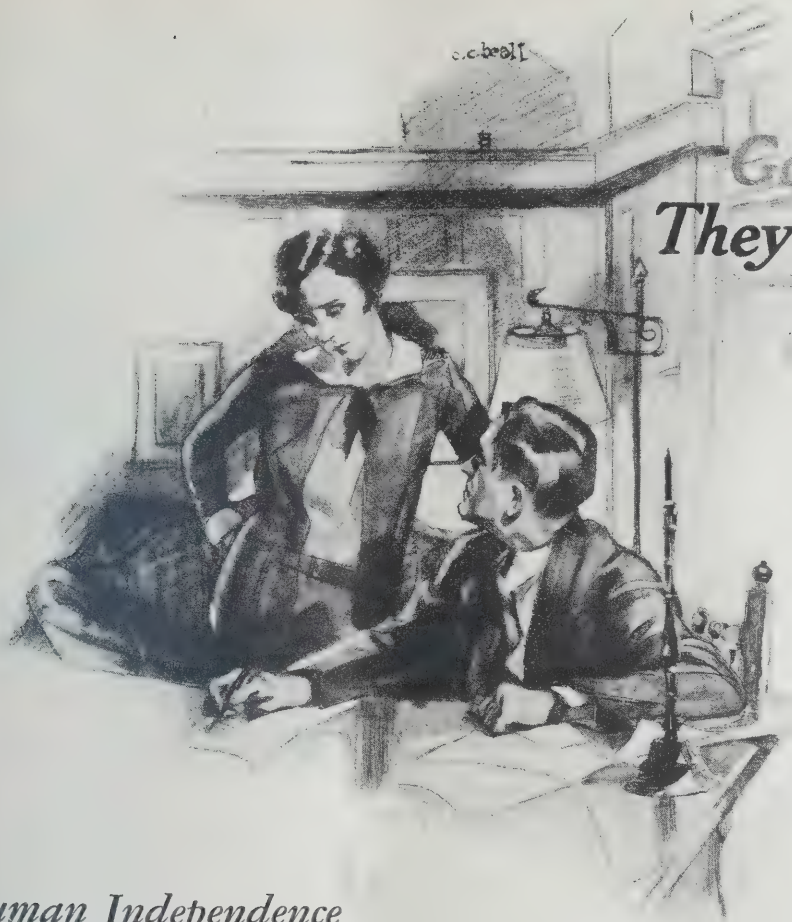
Composition comes next. The artist's genius must conceive the picture he means to paint before his brush touches the canvas. He must pose and group his figures. If he paint a landscape it must all be there. You see a landscape through a window and you know that the window frame cuts off what you want to see to complete the view. But a picture frame, if the landscape be rightly done, suggests no limitations—the picture is entire.

The copyists whom you watch always begin where the creator began, with outlines and masses. Any picture grows from a smudgy blur to the perfected work. Its arrangement is always a balance of full and empty spaces; it takes as much skill—or more—to manage the empty spaces as the full, which is true of pretty much everything including even the intelligent use of one's own head. The picture is, of course, in the full spaces, but the perspective and composure—the peace of it, so to speak—are in the empty spaces. They are anything you please—sky or shadow, or the walls and ceilings of a room, or some suggestion of distant landscape; but they are always there, the background against which the real picture emerges.

Then the artist draws his containing lines which hold what he wants you to see. Here is a test of skill which needs and bears endless study. Take one of the greatest creations of the world—Rubens' 'Descent from the Cross' in the transept of Antwerp Cathedral—there are nine figures in this picture almost life-size. They are letting down, in sorrow, labor and reverence, the body of Jesus from the Cross.

But the central lines of the painting are continuous from the lower left to the upper right, not a single figure outside the unity of the composition; line leads to line and carries the eye to the central figure.

I've a notion the great painters always painted with no particular philosophy of art. They had a free mastery which was their birthright; they saw a range and delicacy of color to which the untrained eye is blind, and left their canvases to the future to explain as it pleased.



Good Pay, but — They are Not Getting Ahead

Their Problem Solved by This Rational Worryless New Life

THESE harried people under this combination of best working and living conditions, can make a moderate savings account lead to real independence . . . It is possible to make one of these farms pay for itself in a few years. Add year-round outdoor life, a summer climate the whole year and an attractive location on the beautiful Gulf and next to one of the finest of modern cities.

Venice a Natural All-Year Resort

Venice life is divided between agriculture, industry and resort activities. Vacationists remark the variety of diversions. Here one finds the West Coast's only mainland beach and its most famous fishing grounds. Here is a modern city planned and built by experts, which fronts on the beach. Adjacent to it is the largest and most comprehensive farm development ever projected in America.

Venice hotels, with fixed rates at $5 to $15, and plenty of rooms at $5, serve fruit, vegetables, milk and cream received fresh each day from Venice Farms nearby. Conveniently located are well-kept golf courses, tennis courts, quoits and other games, and excellent hunting and fishing are found on the tropical Myakka River.

[We limit this advertising to demonstrable facts supplied by the Venice Farm Board and officials in charge of the City of Venice]

THE VENICE COMPANY
Owned by The Brotherhood of Locomotive Engineers

Human Independence as worked out by a 63-year-old Organization

HOW blindly do some people go along barely fighting off expenses! And yet how narrowly they miss a competence, miss independence. Capable and industrious, they occupy positions for which they are not suited and struggle against conditions which weigh them down.

Such a practical organization as the Brotherhood of Locomotive Engineers, whose financial operations extend from coast to coast, has for more than sixty years made a study of living and working conditions with a view to solving the problems of just such people as these.

If your earnings, though good, fail to yield a real margin above expenses, you can well investigate what the Brotherhood is doing on its farms at Venice on the Gulf, to provide a substantial basis of financial independence for families or a newer, freer life, in Florida's health-giving air and sunshine.

Venice Farms, in tracts from five acres up, offer a great variety of speed-profit crops, three or four a year if you like—which reach markets ten to sixty days earlier than other sections, and thus command highest prices.

Behind every Venice farmer stands the Venice Farm Board prepared to render helpful, intelligent field advice and service. The farms are sold by the Board, at moderate prices on liberal terms, with the land cleared and ready to plant. Near at hand are the facilities of the Venice Demonstration Farm, the Venice Nursery and the Venice Dairy Farms.

Mail this coupon for the Illustrated Booklet containing information and photographs supplied by the Venice Farm Board, and Resort Officials, describing the opportunity to lead a new free life under ideal conditions at Venice on the Gulf.

THE VENICE COMPANY
110 Venice Boulevard
Venice, Florida

Please send me the booklet, containing information and photographs supplied by the Venice Farm Board and Resort Officials, describing "A New Life of Independence" possible under the pleasant conditions at Venice.

If I Were in College Again

(*Continued from page 15*)

I have learned that, sooner or later, every intelligent man is called upon publicly to express his ideas, and no matter how congested his brain may be with ideas he will suffer much pain and have little success unless he has had pretty regular and persistent practice in speaking. If one has not had the practice earlier, the best place to get it is in college.

I RAN across an old classmate last spring, an engineer of no little repute, whom I had not met since the day of graduation. He has a son now halfway through high school, whom he hopes to give a college training in engineering. 'How are you going to make his course in college different from your own?' I asked, 'or what are you going to insist that he study that you left out?' I had no doubt but that he would say 'mathematics' at once, but he did not.

'I shall have him learn to write and to speak,' he answered, 'and I shall insist that he begin as a freshman. In my own college days I avoided every opportunity to do either, with the idea that only ministers and lawyers have need of such practice, and I suffer for it every day. My boy is to be an engineer, it is true, but I am going to see that he does not make the same mistake that I made.'

When I am called on unexpectedly to speak, and my knees shake, and my voice falters, and the word that I grope for I find with difficulty, or I fail to find at all, I agree with my classmate, and I feel sure that if I had again the chance I had in college, I should try to learn to speak correctly and without notes.

I wish that while I had the opportunity in college I had learned to play well some athletic game. The desire does not arise entirely from the fact that I should have derived pleasure from the game, or that I should have won honor in the exhibition of my skill, though I think that would have been worth while. My regret comes more from the fact that I am now missing a great deal from not having developed interest and skill in such a game. If a man succeeds after graduation, as all hope to do, he gets into a business that is likely to be cruelly exacting, and he demands some relaxation in which he finds pleasure.

One of the youngest old men whom I have ever known, and one of the busiest, still finds time every day to steal away from the cares of his business office to play around a golf course. He was a golf champion in his youth, and the game still lures him. He is better fitted to do business from being out in the open air, and the people with whom he comes in contact are happier because he is less irritable.

AS FOR me, it is no pleasure to me to hit a bag that simply bounds back to be struck again, or to pull a weight that drops stupidly and inertly down to be raised the second time. I should rather be in the garden, saw wood, or beat a carpet hanging on the clothesline in the back yard. I find no virtue in any of the machinery or in any of the 'systems' devised by shrewd inventors for keeping the human system in ideal working condition. If I am to have pleasure in exercise, and I find it pretty dull to take it from a sense of duty only, it must be in a physical contest where something definite is to be accomplished, where I have a goal to attain, or an opponent to beat. I should rather play a good game of tennis, or ride a horse well, than to have at my disposal all the exercisers, or systems, in christendom.

There are few things which help more to keep men young and strong and ready for the daily battles of life than good physical health; and the athletic game aids materially in bringing about that condition. One may learn, of course, after he is out of college; but pride and awkwardness, and the manifold duties of the day, come in and prevent one's doing so. If a man does not develop the habit with some skill while young, he is very unlikely to do so later.

If I could repeat my college course, I should determine to learn to do some line of work well. As I now remember, I was like many other young fellows who are now in college; I was principally concerned about 'getting through.' I think I was not quite so modest in my scholastic ambitions as the young fellow who told me, not long ago, that a 'pass' was as good as one hundred per cent to him; but at least I was not so much concerned about doing my best in some one line of work as I wish I had been. Every college man is rushed, or thinks he is rushed with work. He takes more hours than he should, or he neglects to prepare the assignments at the proper time, so that when he finally goads himself to the accomplishment of his tasks they are done hastily.

IT IS common habit for students to be behind with their work. I have known fellows even to go so far as to argue that it is an excellent practice to get behind, for if one catches up he must force himself to do a large amount of work in a short time. So he learns concentration which he (and also) argues is a good thing. But work done under such conditions usually shows all the earmarks of slovenliness and superficiality. In the courses which I now teach there are the regular number of fellows who get behind and beg the privilege of handing in the 'late themes.' I have no recollection now that such work is anything but commonplace and conventional. The student who waits for the tardy inspiration is likely to suffer the shock of disappointment.

There are many subjects in which I think it would be sufficient to do merely *good* work, but at least in one subject I wish I had made it a point to take time to give the matter careful thought, and to do it as well as it was possible for me to do. One has to rush through work far too often later in life; it would be a comfort to remember that at one period in my life, at least, I had deliberately taken time enough to do an assigned task well.

I should make more of an effort than I did to get acquainted with my instructors. The conception in the minds even of upperclassmen in college is that the college instructor is a somewhat abnormal being full of knowledge—sometimes—but without

'I wish that while I had the opportunity in college I had learned to play some athletic game.'

'Sooner or later every intelligent man is called upon publicly to express his ideas.'

uch of practical information or human mpathy. I believe that instructors, no atter what their ages may be, are almost ithout exception considered by under- aduates as old, or at any rate as past the riod of youthful enjoyment.

I remember one experience which ustrates my point. A number of young structors, the most patriarchal of whom as not far beyond thirty, were innocently ending the evening at a dancing party. me young undergraduates passing along e street were attracted by the music, d looked in to see who was so frivolous. hen they saw who composed the party one the fellows, more astonished than the st, turned to his companions and gasped t, 'Well, can those old things dance?'

A member of a recent graduating class, ho was the following year to act as an sistant in one of the college departments, me to me in some apparent distress to k me what attitude he should in the future sume to those undergraduates whom he d previously known, and who had been s friends. It was simply the case of a ally sensible fellow supposing that instruc- rs are different from other normal beings, d so should conduct themselves differ- tly. My friend seemed not a little sur- ised when I assured him that he would be ting entirely properly if he treated his iends in the future the same as he had me in the past.

AS A college student I thought that the ss I bothered my instructor the better, d if by some good fortune he was ill, or t of town, I put it down at the end of the y as one of the blessings for which to be ankful. I came in the end, however, to e that my instructors—even those who d seemed most impossible—were human eatures, with a wide knowledge and a nerous willingness to help. The trouble as with me quite as much as with them. count it the greatest pleasure and benefit my college life that I came to know one structor well, and that from this acquaint- ce there developed a friendship and an spiration that I value more highly an all the rest of my college course. or he had a heart of youth despite his xty years, and he knew better than any her man I have met how to stimulate all at was best in one. How much more it ight have meant to me had I come more osely into contact with the real lives of the her men and women with whom I worked!

I had always wanted to hear Henry ard Beecher, but when he came to town e dollar that was required to get into the cture hall seemed big to me, and I decided wait until the next time; but there was next time, for Beecher died soon after.

I think perhaps I might have been ofited had I heard, as I had many a chance do, the members of the faculty from her departments than those in which I as doing regular work when they occasion- ly talked for the general interest and en- htenment of students, but I generally oved to myself that I had no time for ch things.

If I were to go over my college course gain I think I should take fewer things that e strictly practical. As it was, I wanted cts, and these facts were such as I thought could use in increasing the salary that I ould draw when I got out of college. hen I contemplated registering for a bject, I weighed the probability of its helping me in after life to make money. Now I see that more than anything else, I should have obtained from my college course culture and training of mind.

I CAN appreciate the statement, which I read not long ago, of a practical business man who said that he was glad that while in college he had taken nothing that was practical, because his life was now filled up with such intensely practical things that it was a relief to have been given the broader view which his college course had afforded, and to have something else besides the narrow routine of his daily business to think about. As I think back over my own college work, I am convinced that it was those things which at the time seemed least practical that have helped me most in the work I have had to do, and those which on the surface promise the greatest return have proved of least value.

I am wont to say, when giving advice to young men in college, especially to those who are just entering college, that the main thing which is to occupy their time, and to which they should give their attention, is study—all other things are relatively unimportant; yet if I could be in college again I should show more interest in general college activities.

Social matters such as connect themselves with young women most college students may very safely postpone until the first half, at least, of the college course is over, for the affairs of the heart are seldom injured by waiting. Studies are the *main* thing, but not the only thing, and the student who fails to develop some outside interest is making a mistake. The mere bookworm, I now see, is not so likely to be successful as the man who gets out among his fellows.

Every student should have at least one avocation—one thing that should give relaxation from everyday work and bring him into close contact with men. What this side interest should be depends, of course, upon the individual student; it may be religion, or politics, or oratory, or athletics, but I believe he will be better off, as I should have been, with some side interest that gives opportunity for the study of men, as well as for the acquiring of facts.

It is a delightful experience, and a great opportunity, to be able to spend four years in college, but it is one I may not have again. I made some mistakes; I missed some opportunities; but after all I am not sure that the things I missed are better than the things I got. If suggestions I have given here, however, shall help some student to get more out of his undergraduate course, I shall be content.

Man's Flat Wheels

(*Concluded from page 6*)

alence of weak feet, the war showed us something still more important. Weak feet can readily be strengthened, and made less painful. Fallen arches, with all their accompaniment of misery, can be regarded as merely an unnecessary luxury, continued only as long as we desire to retain them. To understand how this was learned, we've got to look at feet for a moment from a military standpoint.

Army men know that the marching powers of troops are of great importance in the success of battles. The army with the best feet, so to speak, has the upper hand. Napoleon said he made war not so much with the arms as the legs of his soldiers. To bear him out, the Battle of Waterloo was lost and history changed because of delay in the arrival of French regiments, through lack of marching ability.

So it is important to develop marching power in troops. That's not so easy. A soldier's equipment usually adds something like fifty per cent to the weight his feet have to carry. Our United States Marine Corps pack, for instance, with full equipment, weighs nearly ninety-five pounds. No inexperienced man can start off and carry a weight like that any great distance without hardship. His feet give out.

Military statistics in general show that one-fourth to one-third of an army sustains at least minor foot injuries in the first few days of marching. In our Civil War whole brigades were temporarily disabled and prevented from marching by foot troubles and the lowered morals resulting from them. In the Franco-Prussian War more than 30,000 German soldiers were completely incapacitated in the first few weeks on account of injuries to the feet. European armies estimate an average loss, because of marching strain, of at least ten per cent in unseasoned troops. In other words, out of every million drafted troops, even with comparatively sound feet, 100,000 would soon be on the sick list because of foot troubles.

NOW add to this painful fact another. Because of the need for men, our own military authorities, when they found so large a proportion of weak feet among the recruits in 1917, did not feel free to reject the flat-footers outright. Although nearly fourteen per cent of the drafted men were found to have defective dogs, less than two per cent were turned down cold. Minor foot troubles with no particular history of discomfort were often not noted at all. This meant that altogether something like fifteen men out of every hundred of the American Expeditionary Forces had fallen arches or other foot defects. The problem immediately presented itself, how to make good marching units out of regiments that already had ten to fifteen per cent of weak-footers to start with.

An orthopedic corps was formed, as a branch of the medical service. Its task was to separate the limpers from the rest, and, with instructions in correct standing and walking, the right shoes, and proper exercise, build up the condition of the feet until they could run and jump and skip and hop and march and carry weight like their buddies.

It came as a shock to more than one old-line military man to know that this care of feet was anything that concerned a *doctor*. One army surgeon, assigned to the orthopedic corps, tells of being asked by his brigade commander what orthopedic corps were. When he explained that the chief job was the building up and care for the physical condition of soldiers' feet, the general's eyebrows went up in surprise.

'I can understand that all right,' he said, 'but what's that got to do with the *medical* corps? D'you call flat feet a *disease*?' It was a new one to him.

(*This is the first of two articles by Mr. Stearns. The next will appear in an early issue.*)

A Tale of Abyssinia

By P. BOULIGIN

IT WAS growing dark. I was sitting on the stones near the gate of my *hebi*, my palace—or hut—made of mud with thatch roof, and surrounded with a fence of prickly branches of the mimosa. Beside me sat old Abatchanaka, wrapped head and all in a dirty bed sheet (*kouta*) with a wide red border. He is respectful and well trained, having had the honor of being *delfani-ashker* (valet) to Mr. Michel who once had lived here.

Abatchanaka is not my *ashker;* I do not pay him. He is not even 'accustomed' to me according to the sense of the word in Addis-Abeba. When you look out of your window and see some stranger zealously shining your spurs or the stirrups of your saddle you must know that he has become 'accustomed' to you; but gradually you will get accustomed to him also and feel ashamed not to pay him for his service. Abatchanaka, however, serves because he is used to it and out of his respect to a Russian, such having been his beloved Mr. Michel whom he mentions with tears.

The natives hate Abatchanaka because he is a *fereng ashker*, that is, a servant of the foreigners. But I need him as a probable substitute for Dessalin, the foreman of my workmen, who gets drunk every evening, drinking with peculiar regularity a terrible native liquor containing tobacco, which causes blindness and degenerates the brain. Abatchanaka has an extremely ugly looking wife and a very white child.

Resting after a hard day's work I watched how below the place where I sat, beyond the poor huts of the workmen, beyond the wild jasmine blossoms and the straw roofs shining from sprinkled water-drops, which served to shade the growing coffee from the sun's rays, behind the irregular dark green wall of full-grown coffee shrubs, sank away and burned out the crimson, green and yellow sunset resembling the feathers of a fairy-tale bird.

Not far from where I sat sounded a 'hou-hou-houh'! It was not the exact howl of a hyena, for the latter sounds more stern and sad. 'What is that, Abatchanaka?' I asked the old man. 'Sow-Jip,' he replied, uncovering his bald head. I did not understand and asked him how it happened that a man could be a hyena. About half a mile from the station lived an old man. All faces turned to stone on my asking his name, and even Abatchanaka, though bribed by the offer of a chew of my tobacco, stopped coming to my gate where I usually followed the sunset with my eye. I lost the hope of getting acquainted with the terrible 'Sow-Jip.'

However, we met. It happened this way. With two spearmen, Tasso and Abatchanaka, and Wondermon, a boy who carried my gun, while going about the plantation I came into a cornfield and out to the river. We sat down to rest under a big baobab tree and then went along on our usual evening way. It was growing dark.

An indescribable silence pervaded the dusk in the dreaming desert. Thoughts became dreamy. A grayish-red pelt slunk along crouching behind the dry, bushy grass. *'Nabir,'* fearfully whispered my *ashkers*. *'Nabir!'* I had never yet seen a leopard at large—this was another thing! The leopard is lord of the native woods. People fear and respect him. They even worship him with sacrifices. His name is surrounded with the legends and superstitions of a dark 3,000-year past.

It was not more than ninety steps to the leopard. The wind was from his side and he did not scent us. Crouching like a cat and slinking along the ground on his stomach, he crept to the group of baobab trees growing by the river. Looking there I nearly forgot the leopard, so funny was the picture. About seventy lemurs were crossing the river. Some were already over and were giving help to those who remained. Apparently the former were the husbands of the latter. Carefully swinging the vines of liana to the side of the monkey mothers the latter also swing out on the vines from the opposite shore. The monkey mothers had their children clinging to their backs or chests according to the degree of bravery of the latter.

The waiting monkeys comically ran their little hands impatiently along the branches of the baobab trees. Apparently they were on a migration to a new home, being driven from the old by the too frequent visits of the feather-footed eagle or by an invasion of ants.

Toward these travelers sneaked the leopard. I felt justified in shooting him, because I was fond of the monkeys. I leveled my gun at the leopard but, warned by the sudden scream of a guinea-hen, he shrank back and, doubling up like a spring, leaped in two bounds into the dense thicket. I shot at random. The monkeys howled hysterically. I walked back smiling to myself over the monkeys' fright.

It was about fifteen steps to the road. There across our path hobbled an old bent man in a dirty *chama* (tunic). He had a graying beard and deeply sunken eyes set in a bony and haggard face. His gait was odd. Extremely bent, he seemed bowing to me as he walked. I thought he must soon be standing on all fours. He passed nearby. I looked back, not hearing the footsteps of my *ashkers*. All three of them had dropped far behind me dragging their heavy feet along the ground. I waited for them to come up.

'Sow-Jip!' whispered Abatchanaka in my ear, hiding his face with his *chama* from the old passer-by. Ordering them to hurry, I rushed to outrun the old man. I wanted to look at him. As soon as he heard our rapid approach, he sat down on the ground, looking at the dirty rags covering his feet. I looked at his face and met his raised eyes and . . . strange prejudice . . . I shuddered! Darkness, the darkness of a black desert, looked at me, the obscurity of fanaticism, of evil thoughts, terrible dreams and the vacuity of savagery. I went home, my *ashkers* disrespectfully outdistancing me.

The next morning I had bad news, Abatchanaka had taken very sick. I hurried to him and found the poor old man in the grip of the most severe dysentery. Only a double dose of opium and black coffee helped him to overcome the charms of the incensed 'Sow-Jip.'

Scorpion-Cloud

Frederick Clayton

THE tiny, silver scorpion-cloud has
stung the moon
So that she has gone quite mad.
Naked she flings herself across the
darkened sky
And catches her hair on star-points.

How shall I reach her?
She has run so fast and far.
Must I, too, await a scorpion's sting
That brings a madness—
Discard my heavy garments of desire
And run with her free across the sky?

How Primitive Was Prehistoric Man?

(Concluded from page 4)

there came another advance in the art of making stone tools. The new industry is called Acheulian, taking its name from the town of Saint-Acheul, in the Somme valley of France, where that type implements were first found.

Like the preceding culture, the Acheulian is characterized by the *coup de poing*. But it is distinguished from the Chellean *coup de poing* by much improvement in the art and skill of chipping, so that the implement is made thinner and with better and sharper cutting edges. The Acheulian man had learned by more delicate and rebounding blows to remove smaller chips in his flaking art, and he could quite control his blow, and could choose the exact spot from which he desired to remove the flake.

THE Acheulian man became a professional chipper of stone. Extensive workshop sites are found. One of them is at Coddington, Bedford, England, where Worthington G. Smith has reported such remarkable finds.

I saw in the museum of South Kensington, London, a flint nucleus nearly one foot long composed practically of every separate chip that the Acheulian workman had struck off from the original nodule, as with intelligent purpose and successful skill he struck away chip after chip—at last leaving in his hands a finished *coup de poing*. The chips were left at the workshop as they fell.

Plaster of Paris was poured into the central open core left in the nucleus after the chips had been reassembled. When they were taken away again, there lay in plaster a duplicate of the *coup de poing* the Acheulian workman had produced as chip by chip he skilfully shaped it from the original nodule.

With the Acheulian perfected *coup de poing*, chips are usually found in great abundance which were evidently struck off in the process of making the *coup de poing*. Many of them were retouched by chipping or in use to serve as knives, scrapers, piercers, and such implements.

The Acheulian culture finished the second interglacial period. The climate became cool, then cold as the extreme rigors of the Riss Glacier were felt. However, man survived through the Riss glacial period, but with no advance in his stone craft. The Weimar man lived near the close of this glacial period, and his bones were found with Acheulian culture implements. During those long periods of the Chellean and the Acheulian cultures their creators passed very extensively over the earth.

Just how far they went is today not known, but their cultural remains are obtained abundantly in the following countries: England, Belgium, France, Spain, Portugal, Italy, Germany, Poland, in Northern Africa they are in Algeria, Tunisia, Egypt and the Sahara. They are also in South Africa, and in Syria and Palestine east of the Mediterranean. They are also far eastward in Indo-China and in Japan.

The earliest Pre-Chellean implements show that the homing instinct was a part of the equipment of the people who used them, because the artifacts are found oftenest in strata of a thickness of a few inches to several feet, and covering areas of a limited extent.

It would seem that the people of the Pre-Chellean, Chellean and Acheulian cultures made their home in the open country, along the sloping river banks, and the sunny uplands. The amount of débris in known home-sites suggests that generation by generation groups numbering, say, up to one or two dozen persons, lived in a sunny spot, separated throughout life, except now and then by accident, from the few other similar distant groups. Nowhere is there evidence that the relationships between groups were of the sort that resulted in barter.

In the much later neolithic times flint stone of superior quality for chipping went widely in barter—as from the wonderful mines at Spiennes, in Belgium. But the paleolithic man made the local stone serve his purpose, even though it was only cobblestones from the creeks, as in some places of Southern France.

We thus have a partial picture of earliest man intellectually alert enough to pick up and use various types of stones naturally fitted for his needs. Gradually he acquired the cunning and skill to chip them rudely: By a long, slow process he advanced in better control of chipping flints and in technique of handling the chipping process until he could fashion and even perfect a few types of implements.

After this long apprenticeship, as we shall see, his control of material and methods progressed faster and faster, until he essayed the use of new materials—as bone, horn and ivory. His technique became new and daring, as he scratched, incised, and cut deeper into those finer textured materials. This new method of shaping hard things opened the way for crude works of art—which later, as incised and carved stone, bone, horn and ivory, played so large a part in the culture of prehistoric man.

All men who have used their hands in shaping the beautiful handicraft of the world owe a debt of gratitude to those early men who through long generations were schooling themselves to the ever finer coördination of hand and brain. The careful student of early man takes off his hat in profound respect to the men who first mastered the art of chipping flint.

THE finding of skeletal remains, and of cultural discards, rejects, or losses of men of the cultures so far mentioned, eolithic, Pre-Chellean, Chellean, and Acheulian, has been, in the main, accidental, because living sites were in the open country, and the men of those early races did not bury their dead.

Following those cultures, however, conditions changed. A new type of man appeared in Europe who often selected his living sites at rock shelters and in grottoes which still survive as definite, restricted sites, and which have often continued to be human dwelling places until today. This new man also frequently, if not always, buried his dead with care and religious practices. This is the Neanderthal man of whom we shall speak more in detail.

Happy New Year in China

(*Concluded from page 13*)

paying the debts of their firm and for themselves, or collecting debts from others. Even at daybreak these lights still burn, and lighted lanterns are carried, for if the lantern is put out, or the street lights cease to burn, one must say '*Kom shi kom shi,*' which means 'Happy New Year.' After this greeting no word of paying debts may be spoken, and the debtor is free from annoyance by harassing bill collectors, till another New Year's season has rolled around.

The main feast of the season comes on *San shih won shan* night, when the people eat food that is richer than on other days. Usually after this feast no one goes to bed. Instead Mah Jongg is played the whole night through, for they fear that if they go to sleep after such rich food they will dream bad dreams, and a bad dream on New Year's Eve is an ill omen for the ensuing year.

To greet the New Year, over every outer door of his home the Chinaman pastes a strip of red paper, cut in intricate designs, which looks like a strip of beautiful red lace. Over the gateway he will have pieces of red paper in which words or figures are cut out. On the back door—if the home is pretentious enough to have more than the one door—pictures of the door gods will be pasted. This is done to keep out evil spirits which would probably enter if the door happened to be left ajar and unguarded.

On the door posts of the homes of newly married persons another sort of picture is pasted, which invites a healthy baby boy to enter that house, riding on the back of the *Chi lin*, a sacred animal.

BUT if even they were unable to honor their dead in the time-old fashion, by firing off crackers at their graves, there was a way wherein Nanking Chinese were able to make their ancestors happy, and that was probably done in every heathen home in the city. The portraits of the ancestors, whenever they had left their portraits behind, were hung over a table in the great room, and on the table dishes of rice and vegetables were placed that the dead might eat.

On the eighteenth day after the feast for the dead, the rice is removed from the bowl. If any water is found in the bottom of the bowl it is looked upon as a warning of a season of floods within the year. If there is no moisture, a drought is predicted.

At midnight on the fourth day after the New Year, the family worships the money god, hoping he will make it possible for them to acquire much wealth. The poor coolie who thus worships must have great faith! It is a tradition that on this night the money god descends to earth. He is supposed to leave all his money in the first house where he calls and is welcomed. For this reason many Chinese stay awake till after midnight. It is also believed that the money god will take all the money from the other houses, and leave it in the last home in which he is welcomed. Some Chinese offer lighted candles on that night, hoping thus to curry favor with the wandering god.

The business men of China feast their clerks on the fifth day of the first month. The clerk who is going to be discharged is given a cup of tea. If it is the manager who is unsatisfactory, and who is going to get the 'sack,' then the fish is so placed upon the table, that its nose is pointed toward the manager. No word is spoken, but these signs give the employe an opportunity to tender his resignation, thus 'saving his face.'

It is etiquette on the part of the employer to refuse to accept this resignation, immediately it is tendered, and sometimes it is given three or four times before it is finally 'reluctantly' accepted.

Ordinarily, the Chinese New Year is a time of great rejoicing and happiness. There is an old Chinese saying: 'After New Year no man plays.'

Strange as the celebration of the Chinese New Year is to the Occidental, there are other things equally strange.

On Christmas day I was invited to the home of a missionary friend in Nanking for my Christmas dinner. Just before the close of the dinner, which was served in mid-afternoon, New England style, a caller was announced by his big red visiting card. He was invited in. A sleek, well-fed individual he was, wearing a stunning black brocaded silk coat, which came to his toes, and a round black silk cap, with a red button on top of it.

My friend's house was a new one, and the Christmas dinner was the first social function held within its walls. The visitor

Young Master Wong celebrating his people's New Year with firecrackers.

announced that he was sent as the ambassador of the King of Thieves. If the honorable foreign devil so wished, he would assure her positive immunity from visitation by any member of the Thieves Guild.

Did she want that immunity? She certainly did when she could be assured of it by the payment of a small sum of money—tea money they call it in Nanking. Of course no word of money was passed between them, for this missionary family has lived many years in China and knows its customs. Our hostess simply shook her own hands while her unique guest shook his own hands, and bowed almost to the ground before her, repeating the performance three times.

He asked to see the things in the house she most prized, and was shown a wonderful old red lacquer vase, a string of jade and silver beads, and her table silver. Bowing himself almost to the floor again, he slowly backed out of the room, saying complimentary things about her, her home and her guests the while.

JUST as though it were an afterthought, our hostess rushed to her desk, took out her purse, extracted a handful of silver twenty-cent pieces from it, and pressed them into the 'reluctant' hand of the ambassador of the King of Thieves, who had slowed up his exit nicely, timing it just so she reached him before he made his final bow on backing out of the doorway. At first he refused the gift, but when she said 'tea money' in Chinese to him—that was different. He could of course accept tea money—any gentleman could. He departed smilingly and evidently well satisfied at his reception.

That handful of small silver insured the house against thievery from the guild for an entire year. In accepting it the ambassador pledged his honor—and do not scoff at the idea of honor among thieves, for it exists. If a straggling thief, not of the Nanking guild, should come along and rob that house, the family would only have to report its loss to the guild, which is by no means a secret organization as it would be in the United States, but exists with a certain amount of protection from the civil authorities. Once the loss is reported the Thieves Guild is obliged to regain the stolen goods and to return them to their owner.

Another missionary family, also friends of mine, were solicited for tea money by this same ambassador. These people decided it would be wrong to encourage such a business, politely accepted the Chinaman's call, and as politely refused his proffer of immunity. It may be that it was just a coincidence, but the fact remains that they had so many things stolen in the next few weeks that they sent for the ambassador and pressed tea money into his hands. Never since then have they lost anything that they could not trace to some servant's desire for 'squeeze.'

Queer people, you say? Yes, queer and very revengeful. This peculiarity of theirs is nothing that has come upon them suddenly in the past few years. Back in 500 B. C.—so history shows—one Ts'u, a man of high standing, commanding great respect from his fellow men, caused the grave of the King of Wu to be opened, and the newly entombed corpse of the king taken out and flogged in public for some real or fancied wrong this dead king had once done to one of Ts'u's family.

High Diddle, Diddle,
The Cat and the Fiddle—

And WHO Wrote *Mother Goose?*

By LOUIS C. KARPINSKI

THE popularity of Mother Goose among English-speaking children extends over a period of one hundred and fifty years, and reaches ıe cradles of the poor and the rich. Who rote these rhymes? and when? and where? ſo one today can answer these questions ·ith certainty, since the early editions were ɔ much enjoyed by the children that the ooks were 'read to pieces' and no longer ɛist.

Certain it is ıat on May 16, 777, the English ublishing firm of 'arnan and New- erry published ıe seventh edi- on of *Mother oose's Tales;* cer- ıin it is that homas Carnan ı 1780, on De- ɛmber 28, en- ɛred for copy- ight *Mother oose's Melody, ', Sonnets for the radle.* Quite robably the first dition of the ales was pub- shed before 1767 y John New- erry.

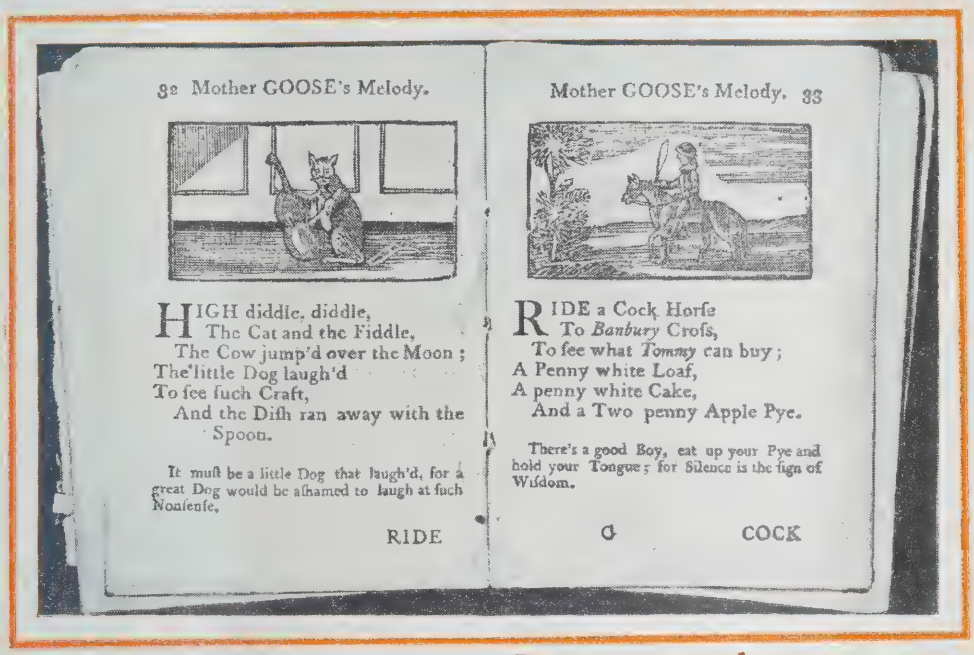
Of course the erses themselves ear witness to he fact that they ere written in ngland, but not ecessarily by ne writer. These rhymes are a growth, part of folklore handed down from eneration to generation. Nevertheless, ɔme one must first have put them to- ether. Who was that person? Oliver oldsmith wrote for Newberry between 762 and 1767 and Oliver had a real ɔve both for children and for their ursery rhymes. He has the greatest laim to be called the compiler.

However mayhap the rhymes were rst brought together in Boston, Mass- chusetts. The story runs that Eliza- eth Foster married a well-known sea aptain by the name of Goose or Ver- oose. Elizabeth Foster's daughter ıarried Thomas Fleet, the New Eng- ınd printer. The Fleets had a large ımily of children, not uncommon in hose good old days, and old Mother oose sang them to sleep with nursery hymes. Thomas Fleet, with an ear to usiness, listened to the rhymes and in 719, so it is said, published the book, *Mother Goose's Melody, or, Sonnets for the Nursery.* Up to this statement con- erning the printing every word of the tory is undoubtedly true! But the rinting of the book has never been stablished.

No copy of this supposed early American edition has come down to us. But neither has any dated copy of Newberry's work survived. Some years ago a gentleman claimed to have seen a copy of Fleet's edition, but it is believed that he was in error, as the copy itself has not again been seen. There is in the British Museum a single copy of the Newberry edition which *is believed* to have been printed about 1780.

Isaiah Thomas, father of American printing, published an edition about 1785. In the library of the American Antiquarian Society, loaned to them by the distinguished collector, Dr. Charles L. Nichols, of Worcester, there is a copy with title-page of the 1799 Isaiah Thomas edition. There is also without title-page a copy quite certainly of the 1786 edition.

Personally, I should like to believe that these fine rhymes were published first in Boston. I like this story about a real Mother Goose—or even Vergoose, as the name is sometimes spelled. Let our patriotic New England readers search their attics! and let some one find an edition of *Mother Goose* of 1719; or, indeed, find any edition printed in Boston before 1780. The search will be well rewarded, as such a copy would certainly bring hundreds of dollars! Best of all, Mother Vergoose's memory would be vindicated and Mother Goose could then be associated with Boston in that intimate way with which today we associate Boston and baked beans.



32 Mother GOOSE's Melody.

HIGH diddle, diddle,
The Cat and the Fiddle,
The Cow jump'd over the Moon;
The little Dog laugh'd
To see such Craft,
And the Dish ran away with the Spoon.

It must be a little Dog that laugh'd, for a great Dog would be ashamed to laugh at such Nonsense.

RIDE

Mother GOOSE's Melody. 33

RIDE a Cock Horse
To *Banbury* Cross,
To see what *Tommy* can buy;
A Penny white Loaf,
A penny white Cake,
And a Two penny Apple Pye.

There's a good Boy, eat up your Pye and hold your Tongue; for Silence is the sign of Wisdom.

6 COCK

Facsimiles of typical pages from 'Mother Goose's Melody,' the contents of which were 'calculated to amuse children and excite them to sleep.'

LITTLE BO-PEEP

LITTLE Bo-peep has lost her sheep,
And can't tell where to find them;
Leave them alone, and they'll come home,
And bring their tails behind them.

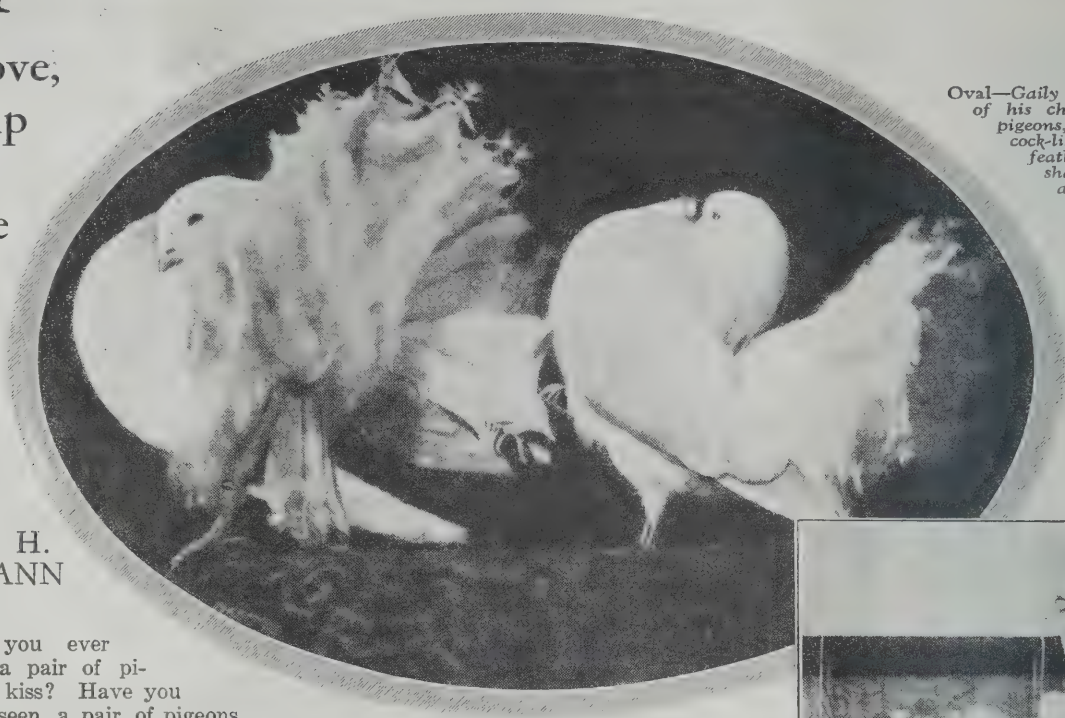
Little Bo-peep fell fast asleep,
And dreamed she heard them bleating;
But when she awoke, she found it a joke,
For they were still a-fleeting.

Then up she took her little crook,
Determined for to find them;
She found them indeed, but it made her heart bleed,
For they'd left their tails behind them!

It happened one day, as Bo-peep did stray,
Into a meadow hard by,
There she espied their tails side by side,
All hung on a tree to dry

Pigeons *Are Just Like* People

Their Love, Courtship *and* Marriage



Oval—*Gaily courting the bird of his choice. White fantail pigeons, which have a peacock-like tail of 40 or more feathers spread in fan shape, while the average pigeon has only 12 tail feathers.*

By FRANK H. HOLLMANN

HAVE you ever seen a pair of pigeons kiss? Have you ever seen a pair of pigeons go to housekeeping? And, furthermore, have you ever seen a case of divorce among pigeons?

Such questions may seem foolish to the uninitiated, but it is true, nevertheless, that the love-making and the family life of a pair of pigeons are much like those of human beings. Close study and observation of the faces and actions of the feathered beauties will show them capable of expressing all the emotions of human beings—love, hatred, remorse, charity, jealousy, vanity, lasting affection, fickleness, domesticity, a weakness for gadding and gossip and a love of playing jokes on one another—and all of these emotions are expressed to an astonishing degree of development.

Mr. Pigeon is well advanced in the art of wooing and courting; not only is he dashing and debonair, but he is as romantic as a movie hero. Having been wounded by Cupid's dart, he begins the process of flirtation and courting with the proficiency of a past master of the art. He looks about and selects a mate that suits his fancy. Then he woos her as only a pigeon can woo. With his head held proudly, he lowers his wings, spreads out his tail, and marches gaily in front of her, all the time cooing in a soothing tone. He will keep up these antics until successful or repulsed.

If our dainty Miss Pigeon is not pleased with his advances, or if she has already given her heart to another, she will remain quiet all the time the gallant suitor continues to perform his capers. Finally, when he halts for a moment, as if waiting for a reply, she will coo softly and move her head back and forth as if nodding a gentle refusal. However, should he persist, she loses her temper and strikes him sharply with both her bill and wing. As a rule that ends the matter, and in despair the unsuccessful lover retreats.

But if she should take kindly to his proposal, she will bow her head with all the grace and ease of her sex, wink her eyes, and tremble in the throat, all the while slightly fluttering her wings, as if trembling with fear, and then draw up her shoulders in a proud and haughty manner and spread her tail as if she owned the world.

Occasionally there are desperate cases of 'love at first sight' among pigeons and in that case the 'cooing of the doves' is the most melodious music that Cupid's deft fingers ever played on the heart-strings of a love-enraptured woman. A careful and patient observer occasionally finds a pair of pigeons billing and cooing. Daintily she will extend her beak to her love. Henceforth they remain true to each other, becoming faithful companions for life, sharing each other's joys, labors and sorrows.

After the courtship the bride goes into the nestroom and selects a nest. She indicates her choice to her husband, and as every dutiful young husband should do, he immediately provides the necessary furnishings for their cozy little home. He carries the straws and other nesting material while she arranges the love nest to her liking, and soon lays the first egg. Two days later she lays another egg, which completes the setting. She then proceeds to sit until ten o'clock, not a few minutes after or before the time when the husband arrives to relieve her. In fact, so prompt is he and so accurate is his mental timepiece that it would be safe to set a watch by his appearance on the landing board. The change does not consist merely in her getting off the nest and his getting on, but he first stands on the board outside the nest and coos and bows three times, and caresses her. Then she makes way for him and when he is on the nest, she stands outside and bows and coos for a minute or two.

Thus relieved she goes down into the yard, and first of all takes a bath and dresses her feathers. She is now ready to eat breakfast, sun herself and probably exchange views with the other lady pigeons on the best methods of bringing up a family and training a husband. She enjoys herself in this way until four o'clock, when, exactly on time, she presents herself at her home.

After seventeen days of incubation the eggs hatch. Both parents assume equal responsibility in raising the young.

Frank H. Hollmann, editor of the 'American Pigeon Journal,' with an armful of his feathered beauties.

A newly mated pair of Blue Hungarian pigeons about ready to begin housekeeping.

The French View of the French Debt

(*Concluded from page 7*)

England for having concluded an agreement with America . . . 'preventing . . . by this isolated and premature act, the formation against America of a league of debtor nations.' M. Homberg recalls the contributions of Russia, and the losses of England and France in loans to Russia; 'Is it not just that this loss should be shared in common,' meaning paid by Uncle Sam.

Had the United States at the outset waived payment of the entire French debt, it now appears that these French politician-financiers would have sought from America a further payment to reimburse France for her losses in Russia. Even beyond that the whole question of distribution profits of the war would have seemed reasonable to these politician-financiers. But of course no mention of the Sarre basin, no mention of the German colonies taken over by France, and no mention of an Alsace-Lorraine returned to France. Apparently these are trifles incident to a war in Europe in which your Uncle Sam should have no interest. Let Uncle Sam pay the reparations and for the next 62 years let Uncle Sam (i. e. the American people) pay cash tribute to France, to be dispensed, no doubt, like some of the money in the devastated regions, by French politician-financiers.

The French argument will not appeal to the American people and without the politics it could not appeal to the French people. But present this type of economic nonsense day in and day out in the public press and it will do much to affect the amicable relations existing between France and America.

FRENCH finance is in a serious state. The whole economic structure of France rests upon the achievements of workmen who do not receive a living wage. The great industrialists of France have as yet shown little vision in facing the desperate conditions under which their workmen live. When the French politicians begin to direct their energies to constructive measures to make possible decent living in France for the workers of France, then there will be hope for an economic rehabilitation.

In Belgium the leaders in politics are today concerning themselves with housing and with food, with the problems of the laboring class. France needs to show more concern for internal reforms necessary. This 'passing the buck' to America cannot long delay an appreciation in France that the war debts have little to do with that economic rehabilitation which is essential.

Going to the Movies With Tartarin

(*Concluded from page 8*)

Century shadow theater? Impossible! We brush the cobwebs from our eyes and decide to go along.

There are *two* cinema houses in Tarascon! We went to the 'sweller' of them.

It was a dingy building of uncertain great age on a dim street. There were two dim lights out front that barely revealed a colored poster on each side of the entrance. One announced a Gaumont picture:

FILS De ROI
Avec DINKY DEAN
(L'Emule de Jackie Coogan).

The second offering was none other than our own Tom Mix sitting astride a bucking broncho. All patrons paused before the picture of Tom and heaved sighs of admiration and then passed on inside the shadowy vestibule in excited conversation with their nearest neighbors about *'Monsieur Mees.'*

We bought the most fashionable seats in the house and had to climb up a narrow winding flight of steps to get to them. There were many single vacant seats, but we were three in number and no one would move along to let us sit together. They flinched and scowled and grunted and groaned but would not budge an inch.

ONE of them was a stout middle-aged woman, who seemed to expand as the evening grew longer and warmer until she occupied a seat and a half. She kept passing what looked like black beans from one hand to the other and mumbling over them. Another was a heavy gentleman who might have been Tartarin himself. The dome of his head was bald but he pretended it wasn't by letting the side fringe of hair grow until it probably came down to his shoulders—enough to make a spindly psyche, but instead of coiling it he spread it like a thin and deceptive coat of plaster over the bare weatherboards, and behold a sleazy bungalow of hair!

The third interference was two lovers who occupied only a seat and a quarter which was reduced to one seat as the evening went on, so closely were they glued together.

The hall itself was like a basilica and of undoubted antiquity. The great thickness of the walls was indicated by what threatened to be windows piercing it along the top, but just when they looked as though they might go through and ventilate the stuffy place, they stopped and didn't. So there was no ventilation, which made it a little hard to be fashionably seated up there. So, if you should happen along there of a summer's evening, forego your American desire to sit in 'high places' and buy a cheap seat. Try to imagine sitting in the dusty organ loft of a New England village church.

The 'orchestra' was half filled with soldiers from the local barracks. The village 'cut-ups' were there too, and lived up the last word of their calling.

In the orchestra, the gentlemen all wore their hats; while, strangely, the ladies in the orchestra seats took off their hats and those in the expensive seats kept theirs on. In front of the screen was a tin-panny piano confronted by a playing gentleman who knew how to imitate one. The scene was further enlivened by a few dogs—they are always with us in France—who were also 'cut-ups' after their own canine fashions. And the gentlemen in all parts of the house smoked continuously.

But it was enjoyable, nevertheless, from the moment the bell clanged and lights went out and Tom Mix and Dinky Dean took hold of the audience.

CHATS WITH OFFICE CALLERS

'An American in Paris,' said ***the Returned Traveler,*** 'was urged to attend the opera as giving a spectacle, even in the audience and the theater itself, hardly to be equaled elsewhere in the world. This American replied, "No, I want to see something really French, like the Folies-Bergéres." It happens, however, that the Paris Opera House is the oldest in the world of the great operas, and in the history of music the most famous. The productions are French more than anything else, so much so that in many other countries French is the language of the opera. The Folies-Bergéres, on the other hand, is managed largely by representatives of alien races whose notoriety for exploiting the salacious in the theater is well known. The girls of the Folies-Bergéres are largely English and American, the former being trained in Lancashire, England. Indeed they are well trained as dancers, but not for a moment to be compared with the French dancers at the opera who make of dancing a serious profession. The audience at the Folies-Bergéres is largely American and German and Jewish; the program is printed in English, German and French. Go to the Folies if you wish!—but do not believe that you are seeing something French. The Folies and the Moulin-Rouge, and a dozen worse, could not exist a week in Paris on the French patronage. For one thing, Parisians have no money for such entertainment. For another, their tastes are as decent as ours.

'The opera is French and within its spacious portals you see on every hand the monuments to the great figures who have, as composers and as artists, made the world of music which we have today. Upon that royal staircase the lovers of music have ascended for two and a half centuries. The opera is a glorious tribute to the artistic ability of France; the opera is really French.'

* * *

The Office Caller reported a talk with a librarian of a German city library. 'I understand,' the German said, 'that there is no family life in America. The husband takes his meals downtown, lives at his club, and rarely sees his family. So it has been told to us by some who have been in America.'

Great was the amazement of the German to be told that restaurant meals are far less frequent for most Americans than for Europeans. This is the kind of nonsense retailed in European newspapers by some foreign journalist who has been as far into America as 59th Street in New York City. In point of fact, New York is far less American than Berlin is German, or than London is English. But even in New York there is considerable family life, particularly above 59th Street.

* * *

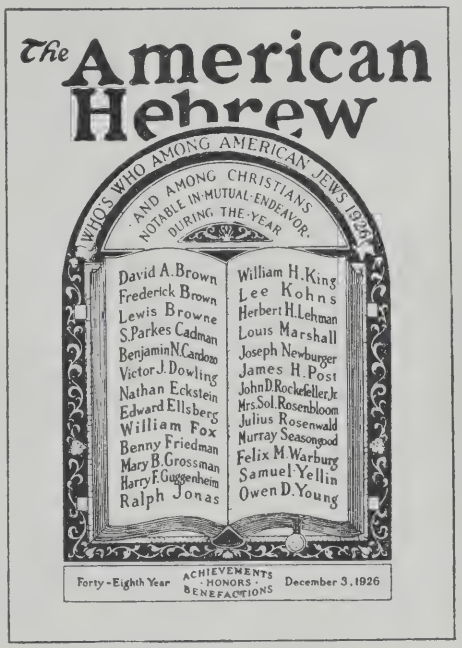
'Although they bear signatures valued at five millions of dollars, not a single parchment of the early proceedings of our first Congresses has been found missing,' said ***the Man from Washington, D.C.,*** who brought us news of the steps being taken by Uncle Sam to preserve those early records.

'For more than a century these historic documents, including the laws passed by the first seventeen Congresses, have been kept in their original, crumbling leather bindings; and were stored here and there in Government buildings. These sheets have been available to generations of clerks, but no one has ever tampered with a single one of the signatures.

'On some of the earlier sheets appears the signature of George Washington in his own hand—"Approved, G. Washington, President of the United States." The Department of State is now having them placed within loose-leaf binders which will be closed with Yale locks.'

* * *

'I just want you to print this in your paper so that all Americans may know who's who in this country,' said ***the Magazine Reader from the City*** as he laid a Front Cover on the desk. It was the front



cover of *The American Hebrew*. We see no harm in reproducing it, as suggested.

'It only occurs to me to wonder how Dr. Cadman, Mr. Rockefeller, Jr., and Owen D. Young must feel in that crowd. Imagine the type of mind that must have made that list! But will the three gentlemen named say anything about it? I very much doubt if they dare.'

* * *

The talk turned to politics and ***the Texas Politician*** was asked whether the 'Solid South' was really solid. As is always true of typical politicians, that reminded him of a story. He related the following:

'On the day after the election of 1908 a cowboy out in Western Nebraska mounted his powder-faced cayuse and rode sixty miles to Chadron after the election returns for the gang.

'While making a night ride on the return trip, the lone bearer of great tidings drowsed in his saddle, the result being that his malevolent broncho executed a coup long contemplated and often deferred by throwing the unsuspecting rider high and far.

'Two weeks later, the cowboy regained his faculties in a hospital with a white-clad nurse bending over him. Smiling up at her he said:

' "It shore do beat hell how Missoury went!" '

That last conscious thought, etched deeply on his brain, had survived two weeks of coma, still standing out vividly.

And small wonder, at that.

Missouri had been a bulwark of the democracy, and her apostasy came without warning, fairly taking the breath of a nation which had been wont to consider the border states as staunch as any south of the line.

It also furnished the first proof that no state is fixed eternally in a political division.

Since the advent of Missouri within the Republican camp, you will remember that the banners of the border states of Kentucky, Tennessee and Oklahoma have swayed precariously there, while Iowa, Michigan, Kansas, Nebraska, and the Dakotas have shown a growing tendency to incline a kindly ear toward the Democratic orators.

The political thought of the country, formerly fixed in two sharp divisions, with a border zone of doubtful states between, has softened to a flux within the last decade, but we have continued to refer to the 'Solid South' as a known quantity.

There are no reports of icebergs having been sighted in the River Styx, but Texas got her Republican Congressman.

More than that, just to prove that his first victory was no fluke, he walked through by an increased majority in 1922, and in 1924 piled up a cool 12,000 over his nearest opponent.

That doubting editor must have taken the returns off the wires in much the frame of mind of the lone cowboy night riding among the sere, dun sandhills of Northwestern Nebraska, holding communion with the stars and attempting to accustom his jarred mentality to the grotesque fact that old Missouri had been and gone and done it.

Perhaps a similar experience awaits those who see here a forewarning that Texas, Gibraltar of democracy, monument of partisanship, holy of dogmatic holies, realm of political witch-burning Cotton Mathers, is in a mood to jar the political seismograph pen clear off the roller, at the first favorable opportunity.

That opportunity may not present itself next year, or the year following, but the old state has viewed the incredible. Before her eyes Democrats of life-long standing have voted for opposition candidates, unscourged of the law, unostracized by their neighbors nor did lightning from the skies strike them dead.

The same uneasy itching for emancipation from political overlordship which shuffled Iowa and Nebraska and Ohio and Kansas into the doubtful column is fermenting in Texas, as elsewhere south, and skeptical editors and ruminating cowboys may as well prepare for additional shocks.

No 'if' is involved; the only question is 'when?'

CAN YOU TELL ME?

QUESTION: What was done with young Rosenbluth who was charged with the killing of Major Cronkhite in 1921? Did he and Pothier remain in the military service of the United States? If so, is either officially promoted to the place of Major Cronkhite?

ANSWER: Major Cronkhite's death occurred at Camp Lewis in 1918. The Military Board of Inquiry returned a verdict of death by accidental discharge of his weapon, and the murder charge was not brought up until two years after his death. M. Pothier was acquitted of the murder by a jury in Federal Court, and the case against Rosenbluth, former captain and jointly accused with Pothier, was dropped. Neither of these men remained in the military service of the United States.

QUESTION: Where did the state of Texas get its name? Where did Idaho get its name?

ANSWER: Texas is an Indian word meaning friends or allies. It does not have an Aztec origin. It applied originally, in the Indian usage, to the Indian tribes about the early Spanish missions around Eastern Texas, and later to tribes ranging as far west as the Rio Grande to designate a large number of tribes who were ordinarily allied against the Apaches. Idaho is derived from the Indian words 'Edah hoe' meaning 'light on the mountains.'

QUESTION: What class or nationality of people are imprisoned in the United States?

ANSWER: There are 45,124 adults in 78 penal institutions. Of these, 18,784 were native-born whites, 11,325 negroes, 1,313 other colored groups, 6,586 foreign-born whites. The native-born whites contributed 88.44 per cent of their quota as determined by the percentage of native-born whites in the country; the blacks 34.86 per cent of their quota; other colored groups 96.82 per cent and foreign-born whites 65.44 per cent.

Northern and Western Europe fills but 78 per cent of its quota, while Southern and Eastern Europe furnishes 141 per cent of its quota. The figures for the different countries are:

Great Britain	24
Ireland	31
Germany and Scandinavia	35
Austria-Hungary	68
Russia and Finland	126
Italy	218
The Balkans	278

QUESTION: What two ex-Presidents of the United States died on the same day?

ANSWER: John Adams and Thomas Jefferson; both died on July 4, 1826.

QUESTION: What was the date of John Morgan's raid through Ohio, and how many men did Morgan have?

ANSWER: John Morgan started on his raid into Ohio on July 2, 1863, with 2,460 men. He surrendered, with 364 of his men, on July 26, 1863.

QUESTION: Of the 77,771 men in the A. E. F. who died abroad, how many were brought back to the United States?

ANSWER: 46,276.

QUESTION: Does a Spanish-American War veteran have to be disabled in any way to receive a pension? If not, how would you go about it?

ANSWER: If the veteran has reached the age of 62 years, he may receive a pension on account of old age. If he has not attained this age, he must have suffered some disability to entitle him to receive a pension. A letter addressed to the Pension Bureau, Washington, D. C., will bring full information.

In this department we shall do our best to answer questions concerning Government and kindred matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

QUESTION: Who serves as Vice-President in case of the President's death when the Vice-President assumes the office of the President?

ANSWER: There is no Vice-President chosen until the next presidential election. The President pro tempore of the Senate presides over the Senate, a regular duty of the Vice-President.

QUESTION: Has Congress at any time in the last thirty years appropriated any public money for either Catholic or Protestant mission schools for the Indians?

ANSWER: No. After Congress has made appropriation for the education of the Indians, contracts are sometimes made with both Protestant and Catholic schools for the carrying out of this educational program. These schools constitute only a small part of the educational work carried on by the Bureau, as in a majority of cases the department maintains its own schools on the reservations.

QUESTION: How many soldiers were there in the Union Army? How many in the Confederate Army?

ANSWER: Enlistments in the Union Army during the war totaled 2,898,304, but the number actually serving was considerably smaller, owing to the large number of men who reënlisted at the expiration of their terms. The number actually serving varied from time to time. There are no official figures for the Confederate Army, but the number is estimated by reliable historians as between 1,000,000 and 1,500,000.

QUESTION: When was the first one-cent coin issued by the United States Treasury? How did its size compare to the current one-cent coin? If the size has been altered, in what year was the present size penny adopted?

ANSWER: The first one-cent coin, made of copper, was issued in 1793. It was much larger than the present one-cent piece, weighing 264 grains, whereas the present coin weighs 48 grains. The first bronze coin, like those used at the present time, was issued in 1864.

QUESTION: At the Washington Conference in 1922, what nation refused to forego the use of poison gas in warfare?

ANSWER: The treaty to prohibit the use of poison gas was signed by representatives of Italy, France, Great Britain, the United States and Japan, at the Arms Conference of 1921-22, with the understanding that their governments would ratify it. The French Government alone refused to ratify. No nation was bound by the treaty unless all signed.

QUESTION: Please tell me the date and year the old settlers' money was paid to them? Also the lawyers that got the money for them and how would a person find out if money was left them in Washington years ago?

ANSWER: Under authority of an act passed June 16, 1880, and subsequent acts, repayments are made to homesteaders in cases of lands erroneously sold, or where the payment made by the homesteader was in excess of the lawful requirement. Application for repayments are handled singly, and each case is decided on its own merits. A letter to the Commissioner of the General Land Office, Washington, D. C., will bring full information. Repayments have been made since the passage of the act, up to the present time.

QUESTION: What was the total book stock valuation of the Chicago, Milwaukee & St. Paul Railroad prior to bankruptcy and what is the total mileage of the system?

ANSWER: The receivership of the Chicago, Milwaukee & St. Paul Railroad was effective March 18, 1925. The figures as of December 31, 1924, are given below:

Common Stock	$117,406,000
Preferred Stock	115,845,800
Total Stock	$233,251,800
Premium on capital stock	36,814
Par value of funded debt actually outstanding December 31, 1924	$440,807,115

Mileage

	Owned	*Operated*
Road (single track)	10,180.83	10,990.97
Additional main track	1,082.65	1,266.40
Industrial tracks	734.73	828.38
Yard track and sidings	2,757.07	2,994.83
Total	14,755.28	16,080.58

I READ IN THE PAPERS

Gertrude Stein has published a book, very learned, very original, very much of a sort 'to engage the illuminati and the illuminati only.' Here's a sample, torn from no context which would distort it:

Does Anyone Know Its Meaning?

'November the fifteenth and simply so that simply so that simply in that simply in that simply so that in that simply in that simply in that way simply so that simply so that in that way simply in that way, simply in that way so that simply so that simply so that simply simply in that, simply that so that simply so that simply so that simply in that, so that simply in that way. Actually the fifteenth of November.'

Do you understand it? And not understanding, do you grieve, feeling that you are debarred from the company of the giants of literature? Or is it an evidence of genius on a high plane? . . . But fear not, good reader! Ask yourself this question: Does it stand the test of intelligibility? Has it logical coherency? Be your own critic of literature as you are your own critic of hats and shoes. Safety lies in self-reliance.

And here is George Sterling dead. A poet he: a true poet. More, a gentle, affectionate character with the cheerful heart of an unselfish man. He was fastidious in his literary tastes, with little use for free verse and no use at all for fantastic stuff of the Gertrude Stein order. He had the true gentleman's instinct which made him shun all lionizing, and he probably took as great pains to shun notoriety as others take to cultivate it. In a recent issue of THE DEARBORN INDEPENDENT he was referred to as one of the modern poets who expressed in direct and simple style many of the questions that present themselves to thoughtful men, and he was characteristically graceful in acknowledging the notice.

A Poet He: a True Poet

The South loses a good man in C. P. Mooney. He was editor of the Memphis *Commercial Appeal,* one of those editors who did not subordinate all aims to the aim of enlarging his circulation. He had opinions and expressed them. What he had to say was reached by a process of serious reasoning. His journalistic methods were dignified and decent.

A Distinct Loss to Journalism

He was in his early sixties at the time of his death, but he had been one of those men devoted to a career of public usefulness who age before their time. His life was a battle and a march. You trace it through his boyhood days as telegrapher, as school-teacher, as editor of a country paper, as reporter in his twenty-sixth year, then to New York where he held responsible positions on the *Daily News,* and as editorial writer on Hearst's *American,* and so to Chicago editing the *Examiner.* Then there was his interest in politics as delegate to national conventions; his directorship in the St. Louis Federal Reserve bank; his trusteeship in the University of Tennessee; his directorship in the Red Cross, to say nothing of activities in Memphis. He had rare qualities of candor and courtesy. He had what is still rarer, a faculty for constructiveness.

The British golf championship is held by an American and the American tennis championship is held by a Parisian. The occasion seems to be ripe for an Hawaiian to grab the ski-jumping title.—Detroit *News.*

❦ ❦ ❦

A secret formula for the production of salts of copper, found in one of Roger Bacon's alchemical works, has been proved effective by the University of Pennsylvania chemists, but too complicated to be of commercial value today. This formula has lain unused for more than 600 years. It was written in cipher, as were all Bacon's other secret formulas, as in the period in which he lived charges of witchcraft and sorcery brought against those who pursued science research were by no means uncommon, and Bacon had to suffer long imprisonment on account of some of his writings.

Roger Bacon's Secret Formula

Roger Bacon is regarded as the greatest scientist of the 13th Century. He was a Franciscan monk and studied at the universities of Oxford and Paris. He is credited in Europe with the discovery of gunpowder, and he was one of the first to find out and test the principles of the telescope. He left behind him numerous scientific works. Roger Bacon is frequently confused with Francis Bacon, Viscount St. Albans, who lived several centuries later and was a contemporary of Shakespeare.

The old controversy as to the correct pronunciation of Samuel Pepys' last name has been revived as the result of the christening of Pepys Avenue in Barnet, England.

Peeps, Pips or Peppis

Some years ago, A. H. Blake, after an investigation of evidence, reported to the Library Association in London in favor of 'Peeps,' but this was in direct opposition to the practice of the Cottenham Pepys, one of whom, when addressed as 'Peeps,' retorted, 'My name, sir, is Peppis.' One, at least, of the diarist's contemporaries would have recognized neither of these. James Carcasse, clerk in the office of Pepys, in his *Lucida Intervalla,* published in 1679, rhymes Pepys with lips, clearly suggesting, that he knew his chief as 'Pips.'—*Manchester Guardian.*

A correspondent of the London *Times* has unearthed the following story from the *Hatters' Gazette* of January 16, 1797:

First Top Hat Created a Big Riot

'John Hetherington, haberdasher of the Strand, was arraigned before the Lord Mayor yesterday on a charge of breach of the peace and inciting to riot and was required to give bonds in the sum of £500. It was in evidence that Mr. Hetherington, who is well connected, appeared on the public highway wearing upon his head what he called a silk hat (which was shiny luster and calculated to frighten timid people). As a matter of fact the officers of the Crown stated that several women fainted at the unusual sight, while children screamed, dogs yelped and a younger son of Cordwainer Thomas was thrown down by the crowd which collected and had his right arm broken.'

VENTRILOQUISM, THE PRACTICE of making the voice come from a particular point, is believed to have played an important part in the magic and ceremonial rites of early peoples.

PORTABLE TIMEPIECES have been in use for 400 years.

THE LION'S MANE AND ruff serve to protect its neck when attacked by enemies.

AN AMERICAN EAGLE WITH a six-foot wing spread was recently found dead after a battle with a porcupine, its head filled with quills.

NOTES - COMMENTS - CRITICISMS

MR. FORD'S Page this week discusses the connection between the working of the hand and the brain.

Violent politicians and newspapers are striving to stir the French peasant to hatred of the United States. The peasant so far has paid little heed. 'Tell the Americans we love them,' he has said. But such a campaign is bound to bear bitter fruit in time if it is allowed to continue. It is a phase of the debt situation that cannot be ignored. (p. 7)

After four years of the iron rule of Mussolini, Italy is once more at the crossroads. The new decision rests not so much with the dictator as with the people. Mussolini has established his own elaborate machinery of government, but will the turbulent Italian character permit this machinery to function smoothly? (p. 1)

It is seldom that an unbiased story comes out of Italy these days. Here is one which shows both the benefits and the defects of Fascismo. Written by a newspaperman long a close observer of Italian affairs, it interprets Italy—and Mussolini—to Americans as few other articles have done. It consists of facts rather than opinions. (p. 1)

One of the great blunders of our educational system is that students are suddenly injected into college with little or no real knowledge of why they are there. They are supplied with an imposing array of theories, but they are not told how to apply those theories to life. (p. 14)

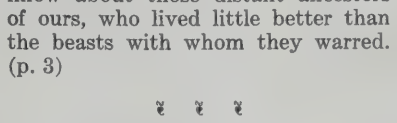
The dean of men in one of the largest universities in the country places himself in the position of the student. He tells what he would do if he were in college again. He tells how *not* to waste time; he explains why he would choose the hard tasks rather than the easy ones; he stresses the value of contact between students and instructors. (p. 14)

Stones were of utmost importance to prehistoric man. He used them first to *pound* and to *crush*. Then as he gradually advanced in intelligence he used them to *cut*, then to *chop*, to *scrape*, to *pierce*. Some of the stones he used still exist. From them the anthropologist pieces together the fascinating tale of early human life. (p. 3)

In this issue is begun a series on earliest man, and how he lived. The articles set forth what we actually know about those distant ancestors of ours, who lived little better than the beasts with whom they warred. (p. 3)

That 'big wet victory' in New York doesn't stand up so well under analysis. With the ballyhoo of the referendum over, politicians are beginning to scan the returns and revise their first estimate. (p. 12)

China has one New Year custom that the Occidental world might well copy: all debts of the old year are paid before the celebrating begins. And there are other customs, equally interesting. (p. 13)



Strange about feet: we seldom think of them unless they hurt. One of the most useful bits of human equipment, they are shamefully neglected by most of us until such time as they complain of the neglect. Then, however, they have ways all their own of calling our attention to themselves. (p. 5)

The movies are truly universal. Wherever one goes—Iceland, the Barbary Coast, the heart of India—one will find 'picture palaces.' Here is a story about a little theater in an old French provincial town. (p. 8)

Another thing almost universal is the appeal of Mother Goose. Surely the rhymes are familiar wherever the English language is known. (p. 25)

Doing art galleries by the mile is hard work. But it is well worth while. For the great galleries are the sifted substance of 500 years of painting, and the pictures are hung in them by the common consent of the art experts of the world. (p. 16)

Glenorm Revisited

Edward Davison

TO THY wild bosom, dark Glenorm,
I brought a deeper woe than thine
When all night long the thunderstorm
Tore moaning from thy crags the pine,
And, where the central wrack was spread,
Ploughed the black heaven round thy head.

That madman whom thou sawest stride
Below thee up the deep ravine
Was I; the midnight could not hide
Thy bulk, or crouch alive between
The lightning's blaze and thee: I saw
Thee cower then and shared thine awe.

Ten years have healed us, though the scars
Remain, not yet forgot somehow;
I watch thee shepherding the stars
And not a grief can touch me now;
After the worst remains the best;
After the journey, food and rest.

Belgium *Tries to Get* on Her Feet

But a Ninety-Four Million Dollar Loan *Will Cost Her* Two Hundred and Twenty-Six Millions

By LOUIS C. KARPINSKI

HE devastation of war continues long after the conflict has terminated. For the con-
rors, no less than for the
quered, the destructive
es released for the strug-
impress themselves for
years upon almost every
se of the economic life
ictor and of vanquished.
one can measure the
al and spiritual losses of
, but the economic de-
uction is no less a con-
ing process.

To understand in any
ree the process of stabi-
tion in Belgium it is
essary, particularly for
American reader, to keep
mind not only the im-
liate effects of the war
even more the long con-
ied after-effects as indi-
ed above.

The exchange situation
Belgium, as in France and
Italy, is only one phase
the problem of money.
wever, certain definite
precise elements of the
rency problem in Belgium
e now been clarified,
plifying in a measure the
rn to economic sanity,
much desired.

In every country the
rency has fluctuated, but
such devious ways and
such small stages, that it
curs without notice except
the financiers. In Amer-
the dollar buys of the
inary commodities about one-half
t it did in 1914; this is fluctuation
depreciation. However, with ref-
ence to gold the dollar buys as much
t did in 1914 and so we assume that
have a stabilized currency.

—*Press Illustrating Service*

The Belgian city of Louvain, showing war's havoc.

THE Belgian Government effected a loan of one hundred millions of dollars for a period of thirty years. It is interesting to note that the loan is stated in terms of DOLLARS *while the stabilized currency is in terms of* POUNDS STERLING. *The consortium granting the loan consists of the Bank of England, the Bank of France, the Reichsbank, the Federal Reserve Bank of the United States, the banks of Holland, Sweden, Hungary and Austria, with the Imperial Bank of Japan. The loan was issued at 94, and a large portion of this six millions difference remained in the hands of bankers. The interest is at 7 per cent whereas before the war the Belgian Government could borrow money at 4 per cent. The Belgian pays. He will pay in all 226 millions for the use of his ninety-four millions.*

The causes which have operated in America to produce the dollar worth about fifty cents have also been effective in Europe. However, in Belgium, as in France and Italy, other factors have entered further to complicate the situation. These factors will be discussed for Belgium and the reader will see that quite similar factors have entered into the debasement of the Italian and French currencies.

The tremendous expenditures required by the destructive forces of war involved the widespread use of millions and billions (or *milliards*) in affairs of business. Before the war Belgium had in circulation less than a billion and a quarter (1.120) of francs. During the German occupancy of Belgium the Germans put into circulation over six billions (6.111) of marks at the rate of 1.25 francs to the mark. At the close of the war, the Belgian Government decided with great courage to redeem the German marks in Belgian francs, making a total of more than seven and a half billions of francs.

In consequence the money in circulation increased from 1914 to 1918 in the ratio of more than five to one. In France and in Italy a tremendous increase in money in circulation was brought about by the purchases of the war. It is worth considering that destruction of real wealth, not the creation of wealth, brings about an enormous increase of money in circulation. As the money is only a symbol for goods, for real things, and as the goods have not increased, these symbols become of less value per unit.

At the close of the war the budget of the Belgian

WHAT *Is the* Matte *With* MEXICO?

By GEORGE A. MILLER

BISHOP OF THE METHODIST EPISCOPAL CHURCH

—P & A Photo.

IS THERE religious persecution in Mexico? Re mob demonstrations have resulted in burning property and death for several victims. Witness affairs of Irapuato, Oaxaca and Guadalajara du the summer of last year. The only part that Mexican Government has had in these demons tions has been to disperse the mobs and mete justice to the guilty parties. In every case the tims of the beatings and killings were law-abi non-Catholics, supposed in some mysterious wa be involved in the issue between the governr and the Vatican. This statement is a proved torical fact, devoid of religious bias. What is ba this unpleasant situation?

Mexico is probably the most misunders country of the Western Hemisphere. To unders what is happening next door south, one must lear think a little in Mexican values. For modern Mex past revolutions and present evolutions are not the r of political accidents or Latin cussedness.

To begin on top, the facts concerning the purpos the Calles Government are very illuminating, in view o widespread propaganda of misrepresentation in the U States. The Calles Government, as a continuation of of Obregon, is the first Mexican administration dedicat the education and economic uplift of the so-called 'Ind the common people. This Mexican Indian is the mo successor of a remarkable, primitive civilization. He by agriculture, built stone cities and stupendous monum (the Teotihuacan pyramid is larger than Cheops), h complex government, a developed religion, an acc astronomy and left written records which were destr by the Spaniards (who could not read them) on the gr that they contained references to the devil.

After three hundred years of Spanish colonial rule Indian of Mexico was worse off than before the conq Such accepted historians as Lucas Aleman, in his *H of Mexico* published in 1830, Augustin Rivera in his *Pr pios Criticos* of the Spanish rule in Mexico, and the au itative *Mexico Across the Centuries*, agree that in 1821, ninety-nine per cent of the people were unable to re write, the Roman Church owned and controlled about third of the property values of Mexico. The Indians been 'baptized but not Christianized,' according to Ri the accepted Catholic historian.

To this the Archbishop in Mexico replies tha Church has always given education to such part o people as were able to appreciate it; also that if was not done for the Indian, it was only for la opportunity. With exclusive control of all educa public and private, for three hundred years, one-third of all the financial values and with an a revenue of some fifty-two million a year (Lucas man), one wonders just what might constitute 'opportu

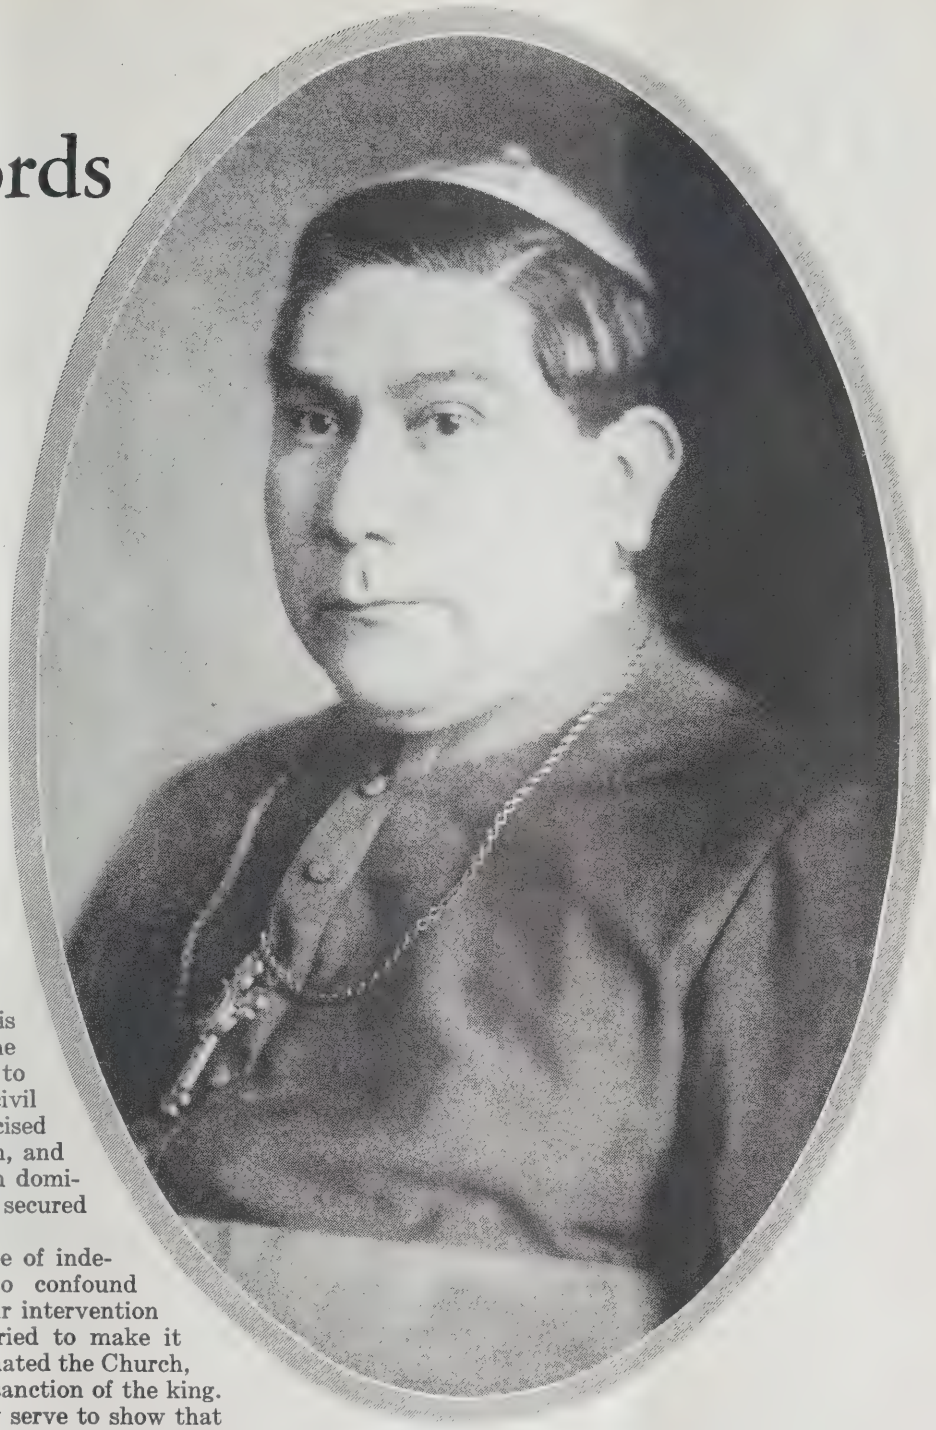
FACTS, *Not* Words

RT. REV. PASCUAL DIAZ

ECRETARY OF THE EPISCOPAL COMMITTEE OF THE ROMAN CATHOLIC CHURCH IN MEXICO



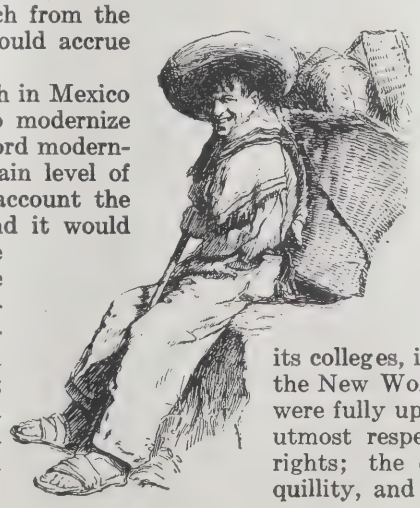
THE Mexican Government, when it became aware of the voice of disapproval raised throughout the entire civilized world against its policy religious matters, thought that it ild fully satisfy public opinion and tify its conduct by sending a circu- to its representatives in foreign ntries, through the Minister of reign Relations, accusing the Catho- Church of having accomplished thing toward the modernization of e Mexican nation and of failure take any step whatsoever to im- ve the people's lot, although it held solute domination over Mexico for ir centuries.

Even if we should admit that this usation is justified, it is plain to that this would not constitute any ical reason for such a cruel persecu- n of the Church.

The fact of the matter is, and this not be denied by any one, that the tholic Church converted Mexico to ristianity; that it never held the civil wer over the nation, as this was exercised three centuries by the kings of Spain, and ch less has the Church held any such domi- ting position since independence was secured 1821.

Mexican governments, since the time of inde- ndence, have always endeavored to confound olitics with religion, and to justify their intervention the Church's affairs, have always tried to make it pear that the monarchs of Spain dominated the Church, that it could do nothing without the sanction of the king. these facts were true they would only serve to show that e Spanish monarchy had abused its power, but on the other nd it would entirely free the Church from the usations made against it, which would accrue lusively to the Spanish kings.

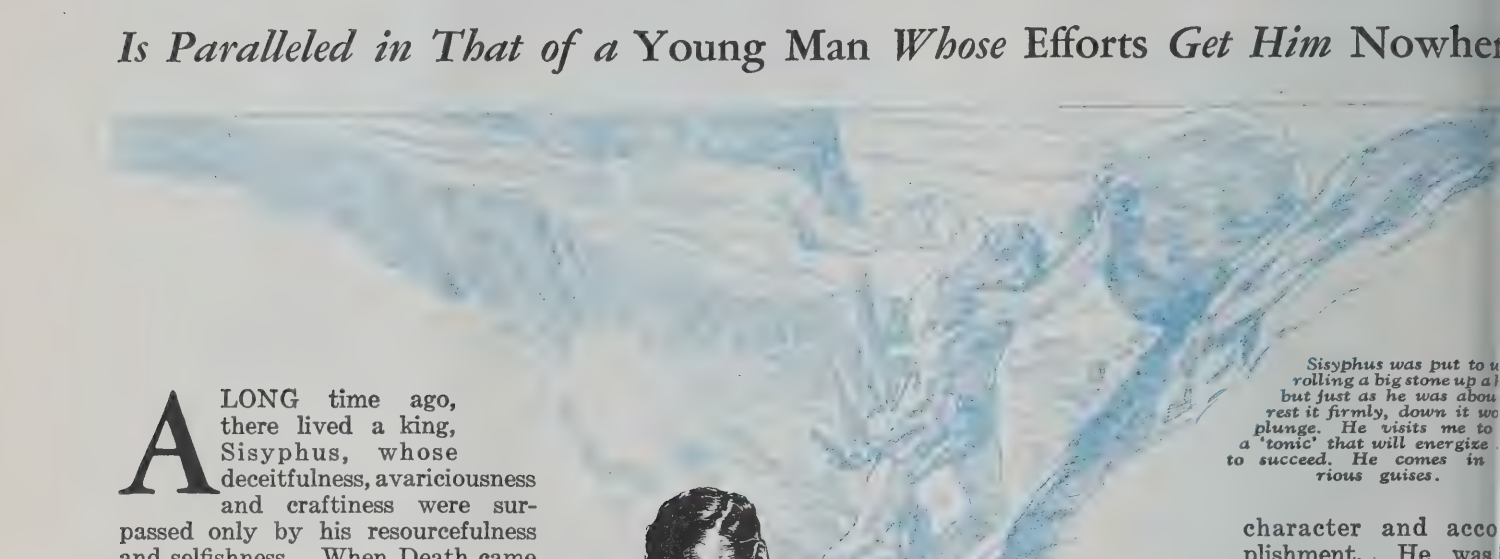
But is it really true that the Church in Mexico s done nothing in four centuries to modernize e country? In the first place, the word modern- ng means the attainment of a certain level of lture and civilization, taking into account the rticular epoch to be considered, and it would ly be ridiculous to claim that the exico of the 16th Century should have joyed the advantages of the tele- ph, that of the 17th Century loco- tives and railways, and in the 18th ntury airplanes and automobiles; at in the 16th Century there could ve been bred the notions that caused e French Revolution, or in the 17th d 18th centuries Bolshevist ideas.



Now to get down to the historical facts, admitted by everyone, it is easily proved that as regards culture and civilization, the Church fulfilled its mission in a most efficient manner during the three centuries of Spanish rule. During that time it Christianized the major portion of that great extent of territory that reaches all the way from Guatemala to the northern boundary of California; it introduced moral customs according to the Christian doctrine; was the teacher of generation upon generation in its university, its colleges, its schools; it brought the first printing press to the New World; performed works of art in all branches that were fully up to the standards of the time; it inculcated the utmost respect for civil authority, personal and property rights; the country enjoyed a period of peace and tranquillity, and though it was not highly *(Concluded on page 27)*

The Punishment *of* Sisyphus

Is Paralleled in That of a Young Man *Whose* Efforts *Get Him* Nowhe



Sisyphus was put to u rolling a big stone up a h but just as he was abou rest it firmly, down it wo plunge. He visits me to a 'tonic' that will energize to succeed. He comes in rious guises.

By JOSEPH COLLINS

Illustrated by W. W. CLARKE

ALONG time ago, there lived a king, Sisyphus, whose deceitfulness, avariciousness and craftiness were surpassed only by his resourcefulness and selfishness. When Death came to conduct him to the underworld, he thrust fetters upon the Styx boatman and kept him in them until a god intervened. Then Death had his way and Sisyphus was put to work in the underworld, rolling a big stone up a steep hill. Each day he would get it to the top, but just as he was about to rest it firmly, down it would plunge to the bottom. He is still at the task. Every now and then, he is allowed to come up for air, and when he does, he visits me to ask my advice as physician. He is keen to get from me a 'tonic' that will energize him to succeed with his task, or to find out if I cannot suggest some ruse by which he can outwit the devil.

He comes in various guises: a man in early maturity, a lusty youth, a faded spinster, a girl to whom the flower of womanhood is belated. One feature he never succeeds in hiding: his psychopathic personality.

He cannot disguise it. To it he owes his impotency, and from it flows his punishment.

I am often asked: 'What is the psychopathic constitution?' And when I reply, 'A constitution that furnishes both seed and soil favorable to mental disequilibrium; one that does not withstand the storms of life or parry the blows of fate; one in which it is impossible to keep the emotions on an even keel, or anything approximating it; one in which there is great disparity between effort and output; an unbalance of urge and inhibition; one which conditions or permits conduct that excites alarm or pity in others,' only the shadow of the picture is conveyed. To convey it, it is necessary to give examples.

If the whole world were aligned, those of psychopathic constitution would be found conspicuously in two places: at the top of the line and at the bottom; geniuses at one end and wastrels at the other, the latter vastly predominating. With the former I shall not concern myself in this writing. They have had much notoriety. They excite our envy, not our pity, as do their brothers at the other end of the line. I propose to let a few of the latter tell their stories, that readers may have their attention diverted from the exploits of highwaymen and legislators, the promises of prophets and the plans of promoters.

It is not easy for a physician to say which is his most pathetic 'case.' He has had so many that have drained the reservoirs of compassion and pity. But I have rarely been more deeply touched by anyone's story than I was by the one that is here submitted. There was such profound disparity of appearance and accomplishment. His lithe figure, finely chiseled features, clear eye and winning smile would have singled him out in any small group as a man of breeding and of parts. The curious onlooker would conjecture: is he a screen-star, or the vice-president of a trust company that has recently absorbed a rival. Should chance convert the onlooker into a listener he would quickly realize that looks belie character and acco plishment. He was human bank, strongly bu beautifully furnished, appro ately equipped, but without fun

And here is his story:

'I am thirty-two years old, married, and have no profession particular occupation. I was pai takingly and persistently educat My means are not great, but if I keep from further squandering th I shall always be beyond want. I a failure, complete and absolute. don't know what to do, nor how to it. I torture myself fifteen hours of the twenty-four with the questi "Am I doing what I should do tha may be useful and happy?" Whe attempt to put into effect any co of conduct which has been sugge to me, or which I have persuaded self will lead to happiness and succ then the torturing question becor "Am I doing right?" Proportionat my persistence comes the convic that had I adopted another cours procedure, everything would have b all right. I drag my existence painf from a question mark to an adv judgment; then back again.

'I have lived nearly half the s of man's life and I have not tributed an iota to the welfare of world, to the happiness of any hu being, least of all to myself. The ear of my desire to cast my infirmit my appeal to you. I am unlike o men and I want to be like them least like some of them. The ques that confronts me is not "If a man shall he live again?" but "Should go on living if life mocks one, clo him in misery and crowns him failure?"

'I have never heard or read case like mine. I am consumed ambition to do something worth w something spectacular and dram I can feel myself doing them if know what I mean, but when I atte

'I have a cruel streak in me. I take delight in knowing that my conduct causes pain to my mother.'

put any plan into effect I am power-
. I am a Prometheus who sees
iself in a marathon contest.

'I first realized that I was not like
er boys when I went to —— School.
as then thirteen years old. I was an
y child and until I was twelve I
lived in a small city less than a
dred miles from Chicago. I went
he public school there for three or
r years, but I never got on well
n the boys of my class or of the
n. They either laughed and jeered
me, or they were contemptible of
and cruel. When I was twelve, my
her sent me to a well-known private
ool in the environs of Chicago, but
r three months there, I was so
nesick that I could not stand it, and
came and took me away.

'I was entered for —— School, to
ch my father had gone, shortly
r I was born. I looked forward to
g there because I was convinced
t I should have a good time and
e friends. I remember that I used
write on slips of paper rules and
monitions that I copied out of books
ch, if followed, would lead to
ndship and success. Not only would
opy them, but I learned them by
rt, and when I was alone in the
se or in the fields, I would repeat
m often aloud.

'Once this habit nearly got me into
uble. It was during the Christmas
days and I was walking in the
ds. Some hunters heard me shout-
and gesticulating and, convinced I
gone crazy, they got the town
stable. When I refused to explain,
y nodded to one another knowingly.

'Whenever I heard of a book on
racter building, I would get it and
our it, and attempt to put into
ctice the things it suggested, but all
no purpose. No one ever liked me,
one sought me out, and even my
chers showed no particular interest
me, though my school work was
quently praised. I was not a
gular guy," I was a "queer duck."

'Though I was fond of exercise,
lking, running, skating, baseball, I
never able to make any of the
ool teams. I don't recall that I
ght them, but I wanted to be asked.
metimes I played scrub baseball,
I remember that when I went up
bat, some of the boys would jeer at
me. All the time, I was trying to find an answer to the question, "What shall I do to be like other boys?" and everything that I did or tried to do seemed to make me more unlike them.

'During my last school year, I was obsessed by the thought, "Where shall I go to college?" and "How can I do everything right at the right time?" There were so many reasons for going to this college, and to that. How did anyone ever decide?

'I finally hit upon a plan. I got a copy of *Who's Who in America* and picked out the names of a hundred men to whom success had come abundantly. I wrote to them and asked which, in their judgment, was the best college. I soon began to get large mail from various parts of the country and this made the principal and some of the teachers who learned of it suspicious; but when I told the principal quite frankly what I had done, all he said was, "Well, you are a queer boy, and no mistake."

'Finally, I decided to go to ——. No sooner was I there than I began to ask myself, "Did I choose the right college after all?" I worked myself into such condition that I could not sleep or work. I went to the dean and got a dispensation that permitted me to go to ——. There I stayed two months investigating. At the end of that time, I went back to —— and stayed there until we entered the war, all the time trying to decide, "Am I doing the right thing?"

'I had never any difficulty in keeping abreast of my studies and passing the examinations creditably, and I was given my degree. I felt that my college life had been a failure and no matter what I should do now, it would be equally fruitless.

'All during my college life, I had looked backward, never forward. I sat in adverse judgment upon my conduct and questioned every decision that I had made. "If I had only done so and so, then so and so would have resulted and I should have been of some use in the world. I had not been invited to join any fraternity, though in a measure they were the lure that had directed me to ——, and I had made no friends with pupils or professors. I was always very fond of literature and rather specialized in English, but none of the teachers seemed to be attracted to me. One day, soon after the war broke out, a Signal Corps instructor came to the university to talk about the attractiveness of the Naval Re-

The NEGRO *As the* Lucky Child *of* Destiny

By
TOWNSEND BOYER

Copyright, 1927, by TOWNSEND BOYER

THE ethnologists tell us that for untold centuries Africa has been soaking up the blood of other races that have sought to establish a foothold on the continent, thus causing the various tribes of Negroes to vary widely in appearance and mental qualities. The pure-blooded Negro, the aborigine of the continent, a timid, gentle-spirited, subservient creature, was pushed by his aggressive brethren, the mixed bloods, away from the more habitable parts of the continent into the tropical jungles of the Congo and the western coasts. Here where he was most accessible to the trade routes between Europe and the New World, hemmed in by the sea and his immemorial enemies, the mixed-blood tribes, these Negroes were simply waiting to be plucked when the era of African slavery was ushered upon the stage of human affairs.

Although the Negro had been in America since 1619, he was not brought here in considerable numbers until just before and after the American Revolution. The clause in the Constitution declaring an end to the slave trade, effective after 1808, was so designed that those interested financially might have time to save themselves; as with the Volstead Law of the present time, this Constitutional decree gave unwonted activity to the slave trade. The bulk of America's slave stock was brought here during this twenty-year period.

Right at the time all this activity was going on in the slave trade, a change in the hearts and minds of people was taking place: the 'rights of the individual' demand was supplanting the 'divine rights of kings' theory as indicated by the French and American revolutions. The stage was being set for the next act in the great drama of African slavery. It is a curious fact, however, that these great spiritual changes in people are nearly always coeval with great material changes; as soon as the nations interested in the slave trade saw the handwriting on the wall in America's Constitutional decree that closed the world's greatest slave market, they began to shove one another, so to speak, to get to the basin to wash their hands of the stain of slavery.

Britain declared the trade with her colonies ended in 1807 thus beating the American date by one year, and went America one better by setting free the slaves in her colonies. Whether this change in the white race was due to pricks of conscience or to the fact that slavery was ceasing to be profitable made no difference so far as the Negro was concerned; he was brought upon the scene just in time to share the white man's long-fought victory for 'rights of the individual.'

Had we followed Britain's lead in setting free our slaves as she had followed ours in ending the traffic, the Negro population of that time would in all probability have been wiped out by absorption, by economic competition with the white race—for which he was totally unfitted—and by repatriation, as in the Liberia colonization movement, for history shows that a free Negro was wanted as a citizen almost nowhere in America. But destiny had other plans for him. In the South where the climate was kind and his physical well-being, at least, was not neglected, he throve and multiplied; moreover, his numbers were added to by illicit traffic right up to the Civil War.

The white races having passed through 'the divine rights of kings' and the 'rights of individuals' were ready for the next step in this trend of thought, 'the brotherhood of man.' In America, however, only a limited group as yet felt this new spiritual change because too many Americans—the shipowners, the traders, the southern planters—were still profiting by slavery.

BUT this small group, together with the English-speaking groups in the other parts of the world, were seized during the first quarter of the 19th Century with a great religious zeal; they felt they were responsible for the moral and spiritual welfare of all the rest of the world and missionaries were sent out to the remotest corners of the globe to preach Christianity and to tell the cannibal, the barbarian and other men that they were the brothers and coequals with these all-powerful white men who had taken over the world for their domain. In some parts of America and South Africa this zeal was carried to the extreme of preaching 'one blood' also, a most unfortunate thing, for it carried with it the seeds for the most difficult phase of race problems.

Finally all the forces that had been gathering for centuries—the restl spirit that sent men exploring on seven seas, the need for power to velop these new lands at a time wh only human power was available the African the only human who co be made to serve, the many c flicting religious, moral and racial ide —gradually concentrated in Amer and exploded in the Civil War. lowly black man from the West Co who had seen nations fighting for privilege of enslaving him was n seeing brothers fight to determine he should be slave or free. And wh he became free they still wrangled o the matter of his becoming a citiz He who had maintained his existe in his homeland only by submiss or flight into the jungle where n but he could live was having amazing experience of white r literally forcing upon his shoulders duties and privileges of citizenship white man's country.

BUT grim fate smiled and inser new threads into the fabric on loom. Great wars usually kill fore something of the old order in hu affairs but always give birth to and unexpected problems and ide Upon seeing what human slavery the one hand and an intempe 'brotherhood' zeal on the other cost America, white races in Ame and elsewhere began to feel sated the brotherhood ideal. People be to ask if, after all, men of diffe races were really brothers—Good maritans to one another they m and should be, but not brothers, brotherhood implies a similarity development, interests, origin. C the races of the world become blood' and civilization survive hopeless submerging of special r qualities into a dull, monotonous, i mass of human beings?

For three-quarters of a cen white races had been preaching trying to practise these princi yet race problems everywhere grown greater and infinitely more c plicated; the white man had about the world trying to better economic and spiritual condition lowly peoples only to have then soon as they were strong enough b shoving him for his place in the And the white man thinks he can well use all the sunny space himse

Thus out of that war to end hu slavery and to establish an ideal all men are free and equal was

at which is the very antithesis of se things, the white race's belief in right to rule by virtue of its achieve-nts, and which was to have effect race relationships everywhere. As African was stepping out of slavery o citizenship he found himself caught a great tide-rip of race feeling, the otherhood of man' ideal and the rdic superiority' ideal. But 'brother-od' zeal was ready for the wane and Negro soon found himself once re in the backyards of the South.

WAS he defeated? Not this lucky ld of destiny.

Without intending it or even realiz- it, by segregating and disfranchising Negro the Southerner simply aranteed his future. It was guar-eed economically because a condi-n was created whereby immigration white races was discouraged and the gro was left in possession of the d of southern labor, which carried th it the opportunity to strike deep ts into the soil of the country.

The Negro's future was also guar-teed racially. When he became free was yet too close to slavery and its posed stigma to be proud of his or or to have any pride in race rity. Had he retained his political wer, naturally he would have con-ued seeking by every means avail-le intermarriage with the white e. The South could no more have isted the effect on its blood of Negro mination than the rest of America ld have resisted the dragging effect a mongrelized South. Even today th all our laws against it, our segre-tion, our outspoken antipathy, race xing goes steadily on. Through olesale race mixing the Negro uld have damaged greatly thout having added anything the general race stock of nerica. Biologists tell us that is not the special highly de-loped qualities of either race at survive race mixing, but e general qualities such as are mmon to all peoples, hence the vering effect of mongrelization.

As things turned out, about e-half—probably two-thirds— the Negro race in America ve no white blood in their ins. It is these pure bloods o hold in themselves what-er the Negro as a race has to offer nerica and civilization, for of course e achievement of a mixed blood is not be accredited wholly to the Negro.

In his isolation, freed from com-tition or molestation by other races, e Negro had time to mature more ly and to take stock of himself and s surroundings. Gradually he came to less ashamed of his skin and less ter about slavery, and as the race gan to accomplish things for itself felt the commendable pride of a race in its creations and achievements.

For the greater part the Negro came to see that his job was not to spread whitewash over himself in an attempt to simulate ivory, but to polish the ebony that was him until it shone brilliantly and was valuable because of its own intrinsic worth. These Negroes felt that in the race's bitter experiences and the peculiarly fortunate turns which the race's progress so often took, was the working of an Unseen Hand shaping things to a good end, that out of the African jungle the lowly black man had been lifted to prepare him for the task of making the black man great.

But hidden from the eyes of most white people a germ of radicalism had been developing among the Negroes—a thing hardly surprising, however, since no race is absolutely uniform in its feelings, desires and ambitions. Something of the nature of the desires of this class can be determined by the activities of one of its societies, which in 1913 is said to have blocked, in eleven out of twelve states, legislative measures looking to the prevention of Negro-White intermarriage.

LITTLE of the activities of this group was apparent to the general public until after the World War, when in the general disorder and hysteria that was sweeping over the world these Negro radicals were emboldened to step forth and proclaim their creed. Their numbers were astounding and the support they could command and the power they wielded no less astounding. White radicals skilled in the art of propaganda joined their forces and the campaign waged was truly astonishing.

Drawn by GERALD VAN DER HEYDEN

Many of the leading magazines of the country began to carry articles subtly attacking the white South and the barrier of race—whether the editors intended this or merely took what appeared to be good news stuff I do not pretend to know. The 'Nordic myth' was 'exploded'; the Negro's skull was shown to be greater in brain capacity than the 'common white trash' of the South; the cramped Negro genius of the South was shown expanding its wings in the warm, congenial atmosphere of the North; Harlem 'high-brown' weddings were contracted with ragged cotton pickers as the measure of social advancement; Methodist camp-meeting songs of the days when masters sat under brush arbors surrounded by their slaves were held up as America's one notable contribution to music, the Negro Spirituals; the Negro was proclaimed the wonder child of history, encompassing as much in fifty years as the white man had in two thousand years; a distinct Negro culture was shown to be neither possible in America nor desirable for its best interests.

WHICH side in this division of the Negro race will win? Only the future can tell. Many things portend success for the radical: there is the general spirit of the times, the willingness to flout the old order of things and try something new not only in material things but in morals and religion as well.

Since a few incidents of history have been proved errors there is a loss of faith in it; the one great lesson that stands out from the history of every race from ancient Egypt to modern times—that national decay is largely due to lowering of race stocks through mixing of divergent types—is lost upon this generation of iconoclasts and unanchored souls. Only people of vision can see things in terms of race, for it is a matter of years and centuries, and life today is essentially a thing of the passing hour; the average person is not interested. Many of the radical group are mixed bloods whose natural endowments fit them for work of an aggressive nature.

On the side of the pure-blooded Negro there is a race consciousness that is in the ascendant and will go higher and higher with intellectual progress and racial achievement. There is the satisfaction that goes with knowing he is one of the elect, so to speak, one of the units in the human scheme, a black man whose race lineage goes back to the dawn of creation; there is the moral strength that goes with knowing he is a pure blood.

While the World War gave birth to a radicalism and a general unrest favorable to the cause of the Negro's radical brethren, it also gave birth to something favorable to him, the intense racial spirit among other races which tends to solidify the interests and sympathies of people of the same race.

There is the encouragement to be derived from the race's history: no matter where in all the wide sea of humanity he drifts he never becomes submerged but always rises to the surface, laughing triumphant, enjoying mere existence as no other people can.

Any Mother to *Any* Daughter

By LADY CYNTHIA ASQUITH

'What are we coming to?' the 'old fogies' moan, staring aghast as round she dances with bobbed hair and defiantly well-shod feet.

MY DEAR, now that you are what is called 'grown-up,' we shall, I gather, be considered conspicuously exceptional if our relationship continues as happy a one as it has always been. For have you not joined the ranks of the 'modern girl,' who, if we are to believe the verdict of contemporary fiction, regards her parent as her natural enemy—or as a scarcely necessary evil?

Continual commentary can be most inflaming. By the time this so greatly exaggerated 'servant problem' ceases to fill our newspapers, every 'tweenie will consider herself a *femme incomprise*.

In the same way the girl of today is puffed up into defiance by the publicity of continual abuse. If she is susceptible to suggestion, how much—how very much—the hysterical attacks on her must have to answer for! What a multitude of heads are shaken, what innumerable sighs breathed, over the girl of today!

To those whom she would label 'old fogies' she is a target for dismayed opprobrium. 'What *are* we coming to?' they moan, staring aghast as round she dances with bobbed hair and defiantly well-shod feet.

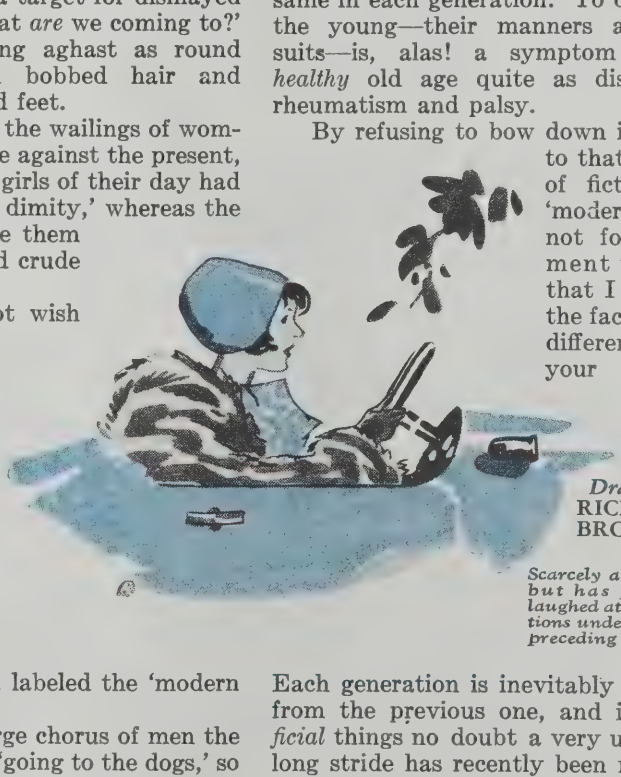
To judge from the wailings of women with a prejudice against the present, it would seem the girls of their day had been all 'dew and dimity,' whereas the present ones strike them as all 'cocktail and crude cretonne.'

Now, I do not wish *you* to take a pained pride in being an unprecedented freak; so, if it be not too great a blow to your dignity, I want you to realize that in every age there has always existed the type, by some shudderingly, by others admiringly, labeled the 'modern girl.'

Just as to a large chorus of men the country is always 'going to the dogs,' so to many women their more emancipated sisters are ever on the brink of social suicide. There have always been the girls who, as pioneers, appeared to their seniors and more conservative contemporaries to be torpedoing the privileges and charms of their sex by repudiating its disabilities in their defiance of convention and their crusade against cant. Scarcely a generation but has pityingly laughed at the restrictions under which the preceding one so contentedly lived.

Comic, no doubt, the fetters on your mother's girlhood, as some day those on your own will seem to your grandchildren; but the *pity*, I fancy, is uncalled for. I doubt whether 'fun' depends on changes in custom, and probably the sum of enjoyment is very much the same in each generation. To deprecate the young—their manners and pursuits—is, alas! a symptom of *unhealthy* old age quite as distinct as rheumatism and palsy.

By refusing to bow down in horror to that figment of fiction, the 'modern girl,' do not for a moment imagine that I question the fact of your difference from your mothers.



Drawings by RICHARD BROECKER

Scarcely a generation but has pityingly laughed at the restrictions under which the preceding one lived.

Each generation is inevitably different from the previous one, and in *superficial* things no doubt a very unusually long stride has recently been made. I think there certainly is more discrepancy between the girls of 1923 and the girls of 1913 than could be claimed between those of 1913 and those of 1903. Space forbids an inventory of your developments, but for one thing I think that, to a certain extent, you have lost the art of leisure. I wonder in what deg this is due to the war.

In that furnace of stress and str conventions, prejudices, and shyn melted like snow in the sun. Owing conditions, anything other than in pendence became a practical impossi ity and chaperones perforce as exti as the dodo. There was no longer lingering on the threshold of wom hood, but an immediate plunge into breathless arena of war work and equally strenuous war play.

Can it be wondered at that, those years of melodrama, ever work and dancing in emotional excitem girls never acquired the graceful ar 'lotus-eating'? They never knew leisure, and now they do not know h to make use of it.

Who shall pronounce whether th is the loss or the gain? It is ind —circumstances considered—no ma for surprise that the embroidery fr has been relinquished for the stee wheel, accomplishments for athlet the *chignon* for the 'guillotine ch No, here there is direct cause and eff and under new conditions there m yet be a violent reaction.

In my opinion, this revolutio mainly one of manners and dress. I see no symptoms of the reported change of heart or mind qualified threaten 'romance.'

Romance is triumphantly prot and, changing ever, is not to be ki by fashions.

MR. FORD'S PAGE

OF THE DEARBORN INDEPENDENT

THERE is a saying, wise in experience, which runs to this effect: 'Woe unto you when all men shall speak well of you! For so did their fathers to the false prophets.' The latter part of the saying is history; it is true of every century and nation that false prophets have reaped great harvests of popularity. The first part of the saying is wisdom, the ripe juice of experience, for the popularity that crackles like a pleasant fire is often fed with the fuel of evaded duty and abandoned ideals.

False prophets are usually honest gentlemen. They have no intention of being false at all. They honestly believe that the true prophet is a fool. Probably there is no doubt anywhere in the world that Isaiah and Jeremiah were true prophets, but they were but two individuals widely separated in time and completely surrounded by a continuous and established order of false prophets. The false prophets were, of course, the ordinary clergy, the ordinary lawyers, the ordinary scholars and rulers of the time. They were the better classes of society and no doubt performed useful service. But they are everywhere described by the Voice of Truth as false prophets, and the heart of their falsity seems to be in the fact that they were not prophets at all; they were professional men. They read in books what other men have read in other books; they study people to see what pleases them most; they note the hard, rough road of the man who insists that the people must *think* and put old familiar things to a more thorough analysis; and they choose the easy way. There is, of course, plenty of routine service to be performed along the easy way, but it is not road-building. The race is on the move, and there is need of road-builders.

False prophets are not to be blamed for not being true prophets, for the truth about them is that they are not prophets at all, and should not pretend to be. But because the instinct of the people is to look for prophets, these others offer themselves to fill the gap. That is the height of their offending. They cannot be true prophets for the simple reason that they are not called to be prophets at all.

It is assumed, of course, in all that has been said here that the term prophet is understood as denoting the leader in any vital course, whether invention, industry, politics, science or religion.

One difference between the true and false prophet is found in this matter of popularity. The false prophet cannot live without it; the other can do very well without it because he must. The reason for his ability to do without it is that he has quite other motives to master him. One who seeks popularity must obey the laws of popularity; but when this is no vital part of one's program one may disregard it.

The true prophet is mastered by other considerations. He is charged with something he must deliver; he is sent on an errand he must perform. He may not talk much about his destiny, but he is conscious of its burden, of the inescapable urge which forces him to the thing he was born to do. He may shrink from the consequences, but he cannot shrink from the duty. It is not to be supposed that he is a joyous rebel flaunting his message to the world for the sake of the pleasure which the subsequent upheaval gives him. No, the rebels who rise for the fun of it and send their insurgent shouts gleefully across the world are almost always false prophets. The true prophet is apt to be keenly sensitive to the offense and pain which the truth so often gives when it first makes contact with falsity. If his word concerns the doom of a system, he feels the suffering of timid souls who do not care to march with progress. The evangelist who sends multitudes to hell with great unction and gusto is a false prophet, and his first falsity is that he does not believe his words enough to feel them; he is repeating a rote.

THE false prophet is usually an honest gentleman whose main error is in posing as a prophet. One fundamental difference between him and the true prophet is in the matter of popularity: the false prophet cannot live without it; the other must. One who seeks popularity must obey the laws of popularity. But the true prophet is mastered by other considerations. He is charged with something he must deliver. He may be keenly sensitive to the offense and pain which truth so often gives, but he has no choice. Acceptance is not his problem; his whole responsibility rests with utterance. Utterance is so important to the Truth that he cannot rest until he speaks.

The true prophet has no choice about his message. It is not given him to pick and choose among the things which the crowd will most readily accept.

Acceptance is not his problem; his whole responsibility rests with utterance. Utterance is so important to the Truth that it does not give him rest until he speaks. And his ability to speak, the force of what he says, is founded in his vision of the truth of it.

His link in the chain is *utterance*. The resulting offense, and, it may be, persecution, is not his affair. He knows that utterance is the sharp flying wedge of truth which must infallibly cleave its way, through all opposition, to a general acceptance. He may not see this at once; he may only see through all his career the gathering forces that oppose his truth; but he *knows* that this very gathering of opposition is providential, for it is being gathered and headed up that it may all be destroyed together.

Goat of the Universe

SOME day it will be generally known that the Washington Disarmament Conference was one of the greatest hoaxes ever perpetrated on the American people. Indications are that that day may not be far distant. One after another those officials who blindly carried out the program of the conference are awaking to its true implications; and some are honest enough to tell the people how they have been fooled. The United States set out to be the beacon of world good will. She ended by being the goat of the universe.

In an exuberance of post-war benevolence, America scrapped millions of dollars' worth of warships, hundreds of thousands of tons of live ship steel. It was the greatest sacrifice ever made by any nation in the history of the world, and it was made with the understanding that the world race for naval supremacy should end. But it has not ended; all that has been accomplished has been the elimination of the United States as a potential world factor. From first place in naval power this nation has slipped to third or even fourth place. Limitation was placed only on those classes of ships in which this nation excelled. America has voluntarily demolished those classes, only to find the other countries forging into supremacy with those types of battleships not mentioned in the treaties. The failure of the other powers to abide by the spirit as well as the letter of the naval agreement has at last aroused Congressional leaders to action. Perhaps no better summary of the situation has been given than that of Chairman Thomas Butler, of the House Naval Affairs Committee.

'The ratio of 5-5-3 was understood by everybody concerned to apply to all classes of warships,' he declares. 'While those powers have not gone back on the promise contained in the bond, they have evaded the spirit of the document, and we can no longer overlook the work of naval construction going on in Great Britain, Japan, France and Italy.

'Having succeeded in inducing the nations to destroy some of their great ships, I supposed that a friendly relation had begun, and that when America sank some 800,000 tons of good steel, those other nations would appreciate the generosity expressed in our willingness to make such an enormous sacrifice.

'But when I learned that those other nations have built more ships than they sacrificed, and that the spirit of the 5-5-3 treaty was not observed, through the construction of smaller vessels than those limited by the treaty, I began to conclude that America had been fooled. I plead guilty to being among those who were deluded, for I reported the bill to the House, and asked the House to pass it, which requested the President to destroy more than $300,000,000 worth of good ships.

'I voted for the reduction of the amounts of money that those nations abroad admitted they owed us. I was delighted to do it. Indeed, I believe there was a time when I would have been glad to have remitted all of the debt. And now I see they have been using those remissions we granted for the building of ships, and thereby compel America to spend several hundred millions more in order to create a fleet comparable to theirs. Our eyes are open, as far as I am concerned, and will not be closed.'

The Modern Bucketeer

IN THE last quarter of the 19th Century the bucket shop made its appearance. At its inception it was boosted as a sporting proposition. It has developed, however, into a swindle shop, with the cards all stacked in the bucketeer's favor.

If members of a stock or commodity exchange were forced to make good the losses of their wayward associates they would keep strict watch upon one another to the end that the customer would have the best of protection. As it stands at present, even the leading exchanges are associations which do not come under law except as any dealer in stocks is affected by blue-sky legislation. At present the bucketeer either plays the market for his own benefit with his customer's money, or executes the forbidden 'wash sale' through which he buys stock for his client only to have it immediately sold and the fund accredited to himself.

In any event the broker, as member of the exchange, receives a healthy toll in the way of commissions from the bucketeer, despite the fact of the Wall Street tradition that any broker who deals with a bucket shop shall be deprived of his seat. Few are the individuals who 'beat the Wall Street game.' The individual who has beaten the modern bucket shop is yet to be found.

In late years the bucket shop has made a practice of appealing to the man of small income to become an 'investor.' Certain worthy financial houses had previously invited clients to purchase sound securities on an installment basis and this was seized upon by the bucketeer to use to his own advantage. While seeming most attractive to the wage-earner, the so-called partial payment plan of stock buying presents a great pitfall. If he falls into the hands of the financial parasites who ape the practices of the better class financial houses, the erstwhile investor will come out with only experience to show for his money.

The partial-payment bucket shop offers stock to its clients on ten payments or more. It is most desirous of obtaining customers when prices are high, for then there is the prospect of buying the stocks when they have become cheaper. The company has six months or a year before the client will be able to demand his stock certificates

—meanwhile the money keeps coming in on payments, and money, according to the philosophy of the bucketeer, can always be put to use.

It is obvious that a period of advancing prices with customers calling for stocks that have been purchased at lower prices makes it exceedingly hot for the bucketeer. But he usually can stave off the evil day until the stocks can be purchased on a lower market. If this cannot be accomplished, there is just another crash and hundreds, maybe thousands, of small investors awaken to the fact that they will not become rich through the partial-payment plans of buying stocks. These would be protected if the company had been compelled to insure against loss to its customers in event of failure.

Cobb and Landis

JUDGE LANDIS may be a good 'czar' but he is not much of a judge, either of men or of the proper way to handle a situation. THE DEARBORN INDEPENDENT has gone further into the facts and causes of baseball scandal than any other publication in the country, and its opinion of Judge Landis' action in the Cobb-Speaker-Leonard sensation is that it violated every canon of judicial fairness. Not only has he pulled a 'boner,' but he has allowed himself to be the tool of vicious intentions in other men. Cobb and Speaker will emerge with the O. K. of the baseball public upon them, but Landis and Leonard will remain a bad taste to all lovers of the game.

Where Light Is Needed

MORE light is needed on the Nicaraguan situation. The haste with which the United States recognized a *de facto* government there, the alleged attempt of the State Department to color news relative to Nicaragua and Mexico, and the keen interest shown in the situation by New York bankers, are all deserving of more careful attention.

Senator Borah has charged that an attempt is being made, through the Nicaraguan situation, to get America into 'a shameless, cowardly little war with Mexico.' Borah is chairman of the Senate Committee on Foreign Relations. His statements are important; they cannot be lightly tossed aside as inconsequential. 'I think it is well recognized,' he has said, 'that the Nicaraguan revolution is being instigated by certain persons in this country who are not Nicaraguans, and this is for business and other reasons.'

Central American politics are ordinarily so complicated that few Americans can follow them. The facts in this instance, however, seem fairly clear. In the 1924 elections Emilino Chamorro, Conservative candidate, was overwhelmingly defeated by Carlos Solorzano, National Liberal. A year later Chamorro executed a *coup d'etat*, and last January he assumed office as president after Solorzano had been forced to resign. But Dr. Juan Sacasa, vice-president under Solorzano, refused to give allegiance to Chamorro, declaring that under the constitution the presidency devolved upon himself. Two months ago Chamorro was persuaded to resign by a United States naval officer, and one Adolfo Diaz was designated president in his stead. The United States recognized Diaz; Mexico recognized Sacasa. So much for the admitted facts.

The disputed facts are also interesting. Diaz claims that Sacasa is bolshevistic; that he is receiving aid from Mexico. And Diaz declares that unless aid is forthcoming from the United States his own government must inevitably fall. Sacasa, denying that he is bolshevistic or that he has any agreement with Mexico, points to the National Railway of Nicaragua, which, he declares, is the prize to be sold on Wall Street. American armed forces have been landed 'for the purpose of protecting American lives and property.' The situation is highly explosive. The American people have the right to know *all* the facts.

Boobs and the Ballot

SENATOR CAPPER'S proposal to impose a fine on all persons who fail to vote serves a useful purpose largely in calling attention once more to the amazing apathy of so-called good citizens toward the affairs of their Government. It can scarcely be given serious consideration as a piece of legislation; you cannot hale a man into court for failing to take advantage of his opportunities and privileges, else you would have most of your population in jail most of the time. This nation affords its citizens probably the greatest opportunities and privileges ever known to man; but it also affords those citizens remarkably wide latitude for making boobs of themselves. And it is a regrettable truth that they seize the latter far more often than the former.

Splendid examples of the outcroppings of boobery have recently been manifested in Pennsylvania, in Illinois, in Indiana. Of what use is it to remind the people of, say, Pennsylvania, that their sovereign rights are imperiled? Their sole answer is to complain that they are powerless against political gangdom. To point out—as Senator Capper does—that less than one-half the possible vote is cast even in presidential years, is a waste of breath and time. A political gang can, of necessity, control only a small proportion of the potential vote at any election. But the gang sees to it that that vote is cast! (In Philadelphia even names from cemetery tombstones have been found as duly qualified and active voters for the gang.)

The boob citizens of Pennsylvania, the citizens who stay away from the polls and then complain at the way the gang runs things, could overthrow the gang at any time. Instead they prefer to remain supine. The blame is theirs and the cross is theirs. Fining them for their own foolishness would be a useless gesture. Boobery cannot be abolished, nor can intelligence be increased, by law.

How Primitive Was Prehistoric Man?

The Hunter

By A. E. JENKS

Copyright, by A. E. JENKS, 1927

IN OUR study of prehistoric man, it must be borne in mind that throughout the times of recurring glaciers there was also the return of glacial animals. Similarly, throughout the recurring warm interglacial periods, the glacial animals largely perished, or migrated, and their places were taken by forms of life fitting the temperate or subtemperate climatic conditions. Among the most important large glacial animals were the mammoth (or woolly elephant), the musk ox, woolly rhinoceros, reindeer, horses, bison and cattle. The horses and reindeer became very abundant during the last glacial period, the Würm, and were a very common source of food supply.

Neanderthal man appeared in the third interglacial period and continued far into the period of the fourth or Würm glacier. Scores of separate fossil remains of individuals of the Neanderthal race have been found scattered geographically well over Continental Europe, England and the Channel Islands. The race was named after the specimen found in 1856 in the valley of the Neander River, Germany.

There is great similarity among all the Neanderthal specimens which are available in child and adult, male and female. Practically every bone in the body has been recovered—bones of arms and hands, legs and feet, vertebrae, ribs, shoulder blades, pelvis, skulls and jaws. Everything is known as to the skeleton of the members of that extensive Neanderthal race of man who lived for forty or more thousand years in Europe.

The skull is low, flat, long, and has most pronounced brow ridges. The eye sockets are circular. The face is large and long. The nasal bones show a low, almost bridgeless nose. The lower jaw is massive and chinless. The *foramen magnum* is farther back than in modern man, showing that the head was carried forward over the chest. The thigh bones are curved and rotated, and, together with the ankle bones, show that the Neanderthal man did not have as completely erect a carriage as the modern man, but walked with a sort of sprung-knee gait—like the very tired pedestrian who drives himself forward in a shuffling walk.

All the bones are heavy, robust and stocky. The vertebral column was quite of one curve, convex on the outer surface, instead of having the triple curve of modern man made necessary for the adjustment to the more erect posture and of getting the trunk directly under the head whose *foramen magnum* is farther forward. The average cranial capacity is about 1,400 cubic centimeters, and the average stature of both men and women is about 5 feet and 4 inches.

Paleolithic man hunted some sixty-six species of mammals, besides the birds, reptiles and other animal forms of life. He was successful only because he was intellectually their superior.

The following specimens are frequently mentioned members of the Neanderthal race, and bear names of localities or sites where found: The original Neanderthal type specimen from Germany, the two specimens of Spy from Belgium, the Gibraltar from Spain, the Krapina in Croatia, and the following from France: Naulette, Le Moustier, La Ferrassie, La Chapelle, Aux-Saints, and those of La Quina, where between 1908 and 1921 twenty different specimens were found. Besides these are the new specimens announced in 1925: The Palestine man from the Robber's Cave at the north end of the Sea of Galilee; the two found by Professor Bontisch-Osmolovsky i the Crimea of Southern Russia; an the several found in Western Siber near Krasnoyarsk, as announced N vember 14, 1925.

Besides these specimens of i dividuals of the distinctive Neanderth race, a very primitive type of Neande thal man was found in 1921 in Norther Rhodesia, Africa, and known as the Rhodesi man. Neanderthal m lived also in many are where no bones have be found but where his in plements are found. Sto implements made by Nea derthal men have be gathered in the Go Desert in Central As and brought back Andrews from his thi Asiatic expedition duri the summer of 192 There are also the imp ments brought by Ab Teilhard de Chardin fro Northern China, and st others from several sit in the British Isles a the neighboring Chan Islands.

Let me bring a br description of the ty site which has given

name to the culture of the Neandert race. It is called 'Mousterian cultu.' Close beside the old village of Moustier on the Vézère River, in Dordogne, France, near the town Les Eyzies, is a typical lime r escarpment not unlike a small bu of our Southwest. It has grass and ot plant growth, so that its rock is bare. On the southern end or expo face of this escarpment is a cave n the top. Below the cave are shelters beneath the over-sloping r face, one below the other. Each these rock shelters was the home for many generations of Neandert men.

In the lower shelter is a bott stratum of the earliest Mouste culture containing discarded stone plements, bones from animal fea and other débris. On top of it

ratum of the second stage of Mouste-
an culture in which the implements
e slightly better made than those of
e lower and earlier stage. In the
per shelter, about thirty-five feet
gher, there are no strata of the first
o culture stages, but the upper
elter began to be occupied in the
ird stage of the Mousterian culture.
th the lower and the upper shelter
ve strata of that third stage. Also
ch has a stratum of the fourth stage
d also of the fifth or last stage.

The stone art of the Neanderthal
an was a very distinct improvement
er that of his predecessor. He
rned how to prepare the flint
cleus or core by chipping until he
d created a plane of percussion or a
tform for striking—so that a single
w removed a deeply concoidal chip
the size desired, and from the exact
t on the surface he wished.

HOUGH the characteristic *coup de
ing* was abundant in the early
ges of Mousterian culture, yet the
anderthal man by his skillful art of
pping refined the earlier, coarse
up de poing until it disappeared,
coming, on the one hand, a fairly
od double-edged knife, and on the
ner, a sharp-pointed implement quite
ke an arrowhead. Perhaps it was used
an arrowhead, or as the head for a
rt, light javelin. He also perfected
scraper, used perhaps in dressing
imal skins. He had another stone
plement which suggests the bola of
uth American Indians; in one site
ree small rounded stones were ac-
ally found side by side, as though
y had been placed there leashed to-
her—as the bola stones are leashed
ether for hurl-
ng at the legs of
hunted animals which trip when entangled in the leather leashes.

Bones were employed for the first time by the Neanderthal man as implements. They were employed as anvils on which other implements were held to be worked by the sharp-edged stone tools. The Museum of Toulouse has a rich collection of those anvils, each the phalanges of a horse. All but two of the score I examined there had two areas about an inch across, thickly hacked as the sharp tool passed on in its downstroke, and was halted by the anvil. The other bone implement was made of the fibula, or lower leg bone, of the cave bear. The fibula was broken diagonally about midway in its length. The upper end, or knee-joint end, of the fibula offers a good handhold, so the Neanderthal hunter used only the upper half of the fibula whose broken end became smooth and polished in continued use. It was a dull, smooth, chisel-edge, and probably was employed in working the surface of skins in the process of tanning.

By the time the Neanderthal race lived in Europe the security and comfort of the home or the habitual nest had greatly changed. Man still now and then lived in the open, but he also lived protected by rock shelters and rock caves. Habitually also he used the protecting element of fire. In what manner he made fire is not known, but he constantly used it, and it was the means by which he wrested the rock-cavern from the cave bear and cave lion, and by means of which he could also prevent the dangerous reëntrance of those monstrous beasts.

THIS protecting fire gave also warmth, light, and cooked food. Cooked food meant the rudiments, at least, of self-control and of social intercourse as the members of the little group sat around while even a few minutes elapsed during even the slightest cooking of the flesh of animals whose broken and split bones are found charred in the ancient fire-hearths of the Neanderthal man.

The rock cavern also contributed to the more rapid increase in the population by protecting and saving life.

Man possessed the protection of roof, back wall and side walls against the periodically destructive elements of nature, wild beasts and enemy men. Life was secure as never before within such rock-sheltered nests. For the first time man's (*Continued on page 26*)

Man's Own Flat Wheels

By MYRON M. STEARN

PART II

When rookies receive the shoes assigned to them there is usually a howl of protest.

A FEW thousand men were weeded out and put in weak-foot battalions, both in this country and in France, during the winter of 1917-18. The plan was sound. Good results were obtained. Although the demand for men was so sharp that the work was never finished, although only a small proportion of the men with weak feet ever got into the flat-foot battalions, and although most of those who did were sent on to the front long before the course of sprouts calculated to give them healthy feet could be completed, the work soon chalked up this big footnote: Fallen arches, so prevalent and so troublesome, can ordinarily be 'built up' by anyone willing to take a reasonable amount of effort. Our soft and suffering feet, even after all the centuries of neglect and shoe-pinching, will still respond splendidly to a few kind words and a square deal.

It's time we began to put this idea on its feet. Our foot problems are not getting any simpler. Foot conditions in this country are considerably worse now than in 1914, among men as well as women. With men the difficulty is usually with the long arch of the foot. Long-arch trouble is fairly evenly divided between the sexes. Forward-arch troubles are far more frequently encountered among women. Styles, particularly those that emphasize narrow toes and high heels, are one great cause.

There are two main causes of fallen feet. The first and foremost is improper shoes. According to a restrained and gentlemanly *Marine Corps Manual* on the proper care of the feet, 'The average individual, upon being measured and subsequently fitted, almost invariably asserts that the shoe given him is too large and that he has worn such and such a size without suffering any inconvenience. From this he deducts that he is the most competent judge of his own size. Furthermore he declares that he can never wear the shoe fitted him, and predicts with all earnestness the direst calamity that will befall him if he does. This man is a fair example of those who, ignorant of their own size, . . . endeavor to jam their feet into anything made of leather, because of the prevailing style. This is a result of the haphazard pernicious system of demand for appearance which has ruined more feet than can be estimated.'

When recruits are fitted with shoes, they are first given the full weight of the equipment they will have to carry on the march. Then they have to stand with the weight thrown forward on the ball of the foot while it is measured. When, after such a measurement, they receive the shoes assigned to them, there is usually a howl of protest. In France it was not unusual for rookies to hunt around and, if possible, swap shoes with someone else in an effort to get something smaller, that they thought would fit their feet better.

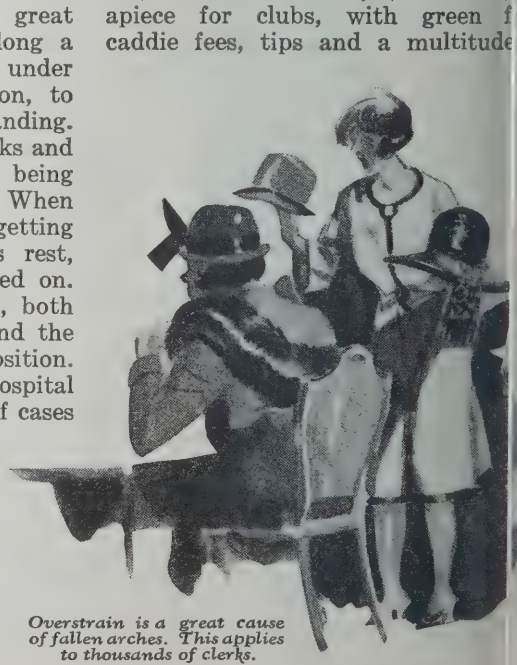
Overstrain is the second great cause of fallen arches. Too long a walk, on feet unaccustomed, under conditions of modern civilization, to extended hiking. Or too long standing. This applies to thousands of clerks and office-workers, accustomed to being on their feet all day long. When walking, one foot at least is getting the advantage of a moment's rest, while the other is being tramped on. But when a person is standing, both feet usually take the weight, and the muscles are held in a strained position.

In one large metropolitan hospital it was noted that the majority of cases of foot trouble among the nurses developed after they had been on duty in the operating room. That is when, ordinarily, the strain on nurses' feet is greatest, since there is no opportunity for even a moment's rest, sometimes for hours together. One of the consulting physicians of the hospi was a foot specialist. He was called to make suggestions that would reli the excessive foot troubles. He p scribed proper shoes. He insisted rest periods and proper foot exercis No nurse was allowed to go on d without having specially fitted sho

These measures gave results. T hospital—one of the comparativ few in the country that have tak such an advanced stand—has n adopted as a definite part of its pol the idea that all its nurses must fin their training with feet at least as g as when they came.

A long walk on hard pavements t often break down arches in a sin afternoon. Fat men, because they a disproportionate burden on th feet, are particularly apt to break do their arches by subjecting them sudden excessive strain—say a walk several miles beyond what they accustomed to, or standing for unusual number of hours.

Business men who play golf o occasionally should see to it that t do not play too many holes in a sin day, and that they have comforta well-fitted shoes to play in. But golfers realize that need for the ri shoes? They do not! Have a glan the next time you are in a coun club, at the line-up of shoes in the m locker room, and see the flattened o one-sided, run-over collection of p man's cast-offs that are usually show. The average golfer, after pay a $200 initiation fee, $100 dues, apiece for clubs, with green f caddie fees, tips and a multitude



Overstrain is a great cause of fallen arches. This applies to thousands of clerks.

inor charges balks at treating his et, that alone make the whole game ssible, to half an hour extra in a shoe ore, and the right pair of shoes.

It is usually only necessary for a an unaccustomed to much walking to e to it that his shoes distribute his eight evenly, and give room for the ll of his foot and toes to spread out they should, to increase his walking radius ough to cover all ordinary requirements.

A train-announcer no is on his feet for any hours each day has opted the simple expedient of having two irs of shoes of different sizes. During the y, when he is at work, wears Number 9 shoes; the evening he wears lumber 8's, that fit his et more snugly.

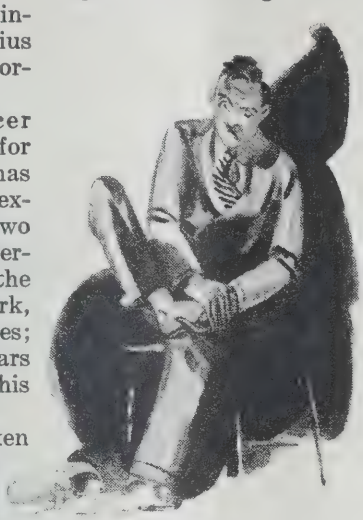
Feet can be broken own by use too soon ter recovery from me debilitating disse or weakness. ervousness or worry, fecting the general alth, puts an extra burden on the feet.

A sporting goods salesman, after a riod of three months of worry concerning his wife's condition—she was a hospital undergoing a serious eration—found his feet hurting and, though he had an apparently strong, gh arch, put arch supports in his oes. They stopped the pain, and ve him relief. With the improvement in his wife's condition his own alth bettered, and after a little ile he threw the supports away, periencing no further trouble.

A sprained ankle, a cut, a foot renched in an automobile accident, ay any of them cause irregular alking, starting a habit of throwing e weight on the foot incorrectly, d perhaps permanently weakening injuring the arch. Corns and bunions me under this head, since, by the in they cause, they make free, althy walking difficult. Even blisters, ough usually only temporary, may use the beginning of bad walking bits, throwing the weight from its oper balance on the tripod.

FOOT specialists do not like the rm 'flat feet.' They're quite fussy out it. They prefer to say, 'weak et.' That is because the height of the ng arch from the ground does not cessarily indicate the health or rength of the foot. Colored people e a low-arch race, yet have, usually, et that will do a lot of work.

During the war one troop in a lored regiment was examined with rticular care. The regiment to which ey belonged was one of the best marching units in the entire army and that particular troop was the best in the regiment. They gave a splendid account of themselves in France. Yet without a single exception the men had what, under the old classification, would be called 'flat feet.' The answer to that riddle lies in the fact that the long arch in the feet of those colored fellows was in every instance so low that the foot seemed flat—and was yet sound and healthy. The old test of fallen arches, a wet footprint made on a hard surface showing whether or not the part of the foot under the long arch touches the floor, is no longer regarded as a sure indication of foot trouble.



If your feet are giving you trouble, read what you must do to strengthen them.

The bad foot is the foot that rolls outward. Physicians have a fancy word for such a foot; they say it 'everts.' The inner edge of an everted foot, instead of the outer edge, rests on the ground. The weight of the body, instead of coming squarely on top of the foot tripods, falls at a slight angle, so that the ankle is thrown *in*, while the bottom of the foot slants *out*. People who toe out unduly are apt to have everted feet. It's your pigeon-toed friends who are the lucky ones. Toeing in tends to throw weight on the outer edge of the feet, and straight down the tripod. In a barefoot boy, or the savage American Indian he reads about, the weight is also carried correctly; they both toe straight ahead. The foot joints are more flexible, the foot muscles are better developed, and the toes spread and grip more in walking in the case of negroes, savages, barefoot boys and monkeys than with civilized man wearing a perfectly good and respectable shoe.

If your feet are already giving you trouble, here are the things you must do to strengthen them. Incidentally, the same things, if your feet are all right, will make them still more serviceable.

The first thing is a properly fitting shoe. That may sound easy, but it's not.

Army surgeons say that men can no more pick the right size shoe for themselves than women. They pick sizes that are too small, and toes that are too narrow. A shoe that pinches gives no chance for the muscles to do their work effectively, and grow strong in doing it.

The second thing is rest. Foot muscles that have been unduly strained have to recuperate. They mustn't be walked on any more than is absolutely necessary.

Then, the third thing, as soon as the foot is rested, comes proper development.

Walking, within the limit of strength and without over-straining, a little more each day.

Walking with the weight on the outer edges of the foot, and the toes pointing straight ahead, the ball of the foot expanding, and the toes spreading out, with each step.

In addition to this, rest the feet frequently. Bathe them in cold water at night.

RUB them briskly and twist them about in every direction, to exercise the muscles still further.

Massage is excellent for the feet, as it tends to stimulate blood circulation.

During the war one of the orthopedic corps doctors gave orders that the troops in his care should take off their shoes and socks in the course of a long march and rub the feet briskly, to stimulate circulation and give them a new lease of life, before putting the footwear on again. It was a rainy day, wet overhead and still wetter underfoot.

Many of the men were without the extra pair of dry socks that the regulations called for. The language, when the marchers found that they were expected merely to take off their wet shoes and hosiery, and then put the same soaking things back on again, was said to be memorable.

Learn to sit in a position that always relaxes one foot at least—say with the weight on the back of the heel, or on the outer edge of the foot, or with the knees crossed.

Better health, fuller vitality, and greater efficiency will be the result.

Rest the feet frequently. Bath them in cold water. Massage is excellent.'

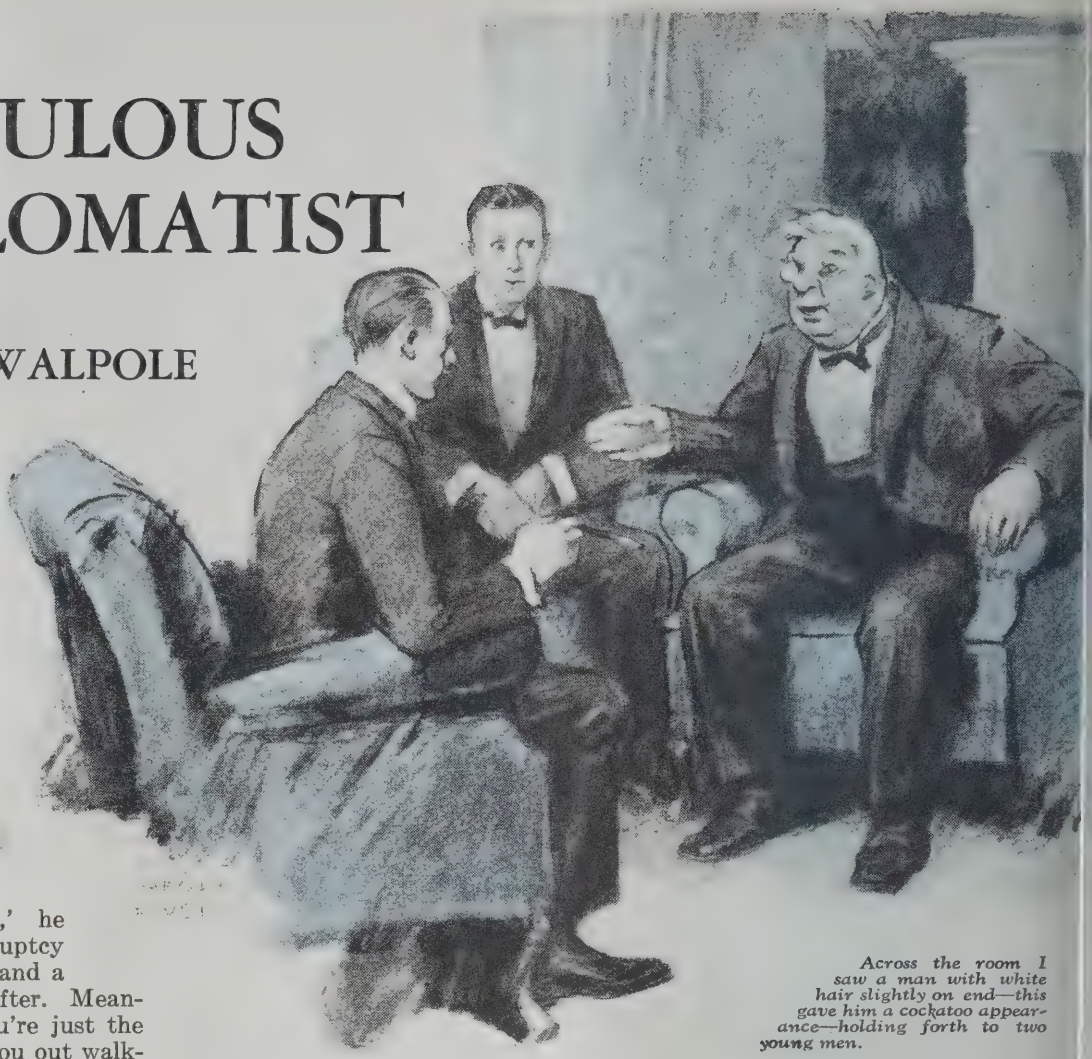
The GARRULOUS DIPLOMATIST

By HUGH WALPOLE

Copyright, by HUGH WALPOLE



Across the room I saw a man with white hair slightly on end—this gave him a cockatoo appearance—holding forth to two young men.

Illustrated by HAROLD FLUCKE

ON A beautiful afternoon in May, as I was walking down Piccadilly, just in the arcade of the Ritz Hotel I was touched on the arm, and, turning round, saw the round, highly polished countenance of Pom Banting uplifted toward me. 'Hullo, Pom,' I said, 'how goes it?'

'It goes very badly,' he answered. 'The Bankruptcy Court sees me next week and a pauper's grave the week after. Meanwhile, young Johnson, you're just the man I want to see. Are you out walking, or is your nurse waiting somewhere round the corner with the pram?'

'I'm allowed to take a little gentle exercise on condition I don't go too far and wear myself out. Meanwhile, that famous club, the Saucepan, is all agog with excitement because I'm about to lunch there, and the windows are hung with flags.'

'That being so,' said Pom, 'we will walk along together. I have something extremely important and mysterious to impart to thee.'

'Impart on,' I said.

'Well, old cream and custard,' Pom continued, 'is it truth or not that some months ago you and one or two other innocents scattered broadcast a letter, the import of which was that you would remove bores from the heart of Society at a moment's notice, demanding but a modest fee in return?'

'I don't know about the modest fee,' I answered. 'We've been such a success during the few months we have been at work that our fees have gone up.'

'The devil they have!' said Pom. 'What are they, anyway?'

'Seventy-five quid in any case,' I answered, 'and a hundred and fifty if we succeed.'

'Well, it might be worse,' said Pom. 'Several of us would be willing to give more than a hundred and fifty if you helped us in our present trouble.'

'Who's "us"?' I asked.

'"Us," ' said Pom, 'are me——'

'Good Heavens!' I interrupted. 'In what language do you imagine you're speaking at the present?'

'Oh, hang English!' said Pom. 'Don't you know I went to Eton? Well, anyway, there are Millie Drake, Huxter, Crawshay, and a lot of others in this, and we'll raise the coin all right if you'll do the job.'

'Well, what is the job?' I asked.

Pom dropped his voice into a mysterious and secretive whisper. 'Do you know old Marcus Pendyce?' he asked.

'What, Pendyce who was Minister at Constantinople and all sorts of other places years ago, who published his reminiscences last year, *People Who Have Seemed to Me Worth While?*'

'The very same,' said Pom.

'Yes, what about him?' I asked.

'Have you ever seen him?' Pom asked.

'No,' I answered.

'Then the Lambs must entertain you very seldom,' he replied.

The Lambs, I need scarcely mention, was that famous and most exclusive of clubs, entering which was harder than camels piercing the eye of the needle, whose wine is a miracle, whose history goes back almost to the days of Adam, Eve, and the Serpent.

'I've been to lunch there a lot of times,' I answered, 'but I don't know old Pendyce by sight. Describe him to me.'

'Five chins, two stomachs, and a face like a beetroot,' said Pom. 'But the strangest thing about him is his voice, which is now deep like the rumbling of a gun, and suddenly shrill as a peahen in anger. He is the greatest bore that the world has ever seen.'

'Tell me more,' I asked. 'How old is he? Is he married?'

'He's well over seventy,' said Pom, 'and ought to be silently contemplating his latter end. He's a widower with no children. He's the greatest bore——'

'Yes,' I interrupted, 'you've said that already. What is it you want me to do?'

'Why, to remove him, of course!' cried Pom. 'Didn't your old letter say that you'd remove anybody so that they'd never come back again?'

'Do you mean to tell me,' I replied, 'that there are all you strong and healthy men, and you're unable to deal with one poor old one over seventy and a widower? Ought to be ashamed of yourselves.'

'One poor old one?' ejaculated Pom. 'You wait until you see him. He's got the strength of five hundred horsemen and then some. He's absolutely unbeatable. He's eternal, inevitable, everlasting. Why, do you mean to say in your clubs you haven't got bores whom no one can get rid of?'

'Try being rude to him,' I said. 'I've known rudeness work wonders before now.'

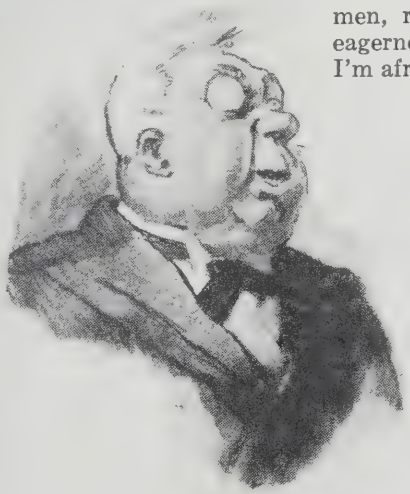
RUDE!' cried Pom. 'You can't be rude to him. He says he's deaf, which, of course, he isn't, and when you say anything to him especially nasty, he thinks you've paid him a compliment, thanks you for it, and clings closer than ever. The fact is, Johnson, that he's ruining our club. Like everyone else, we're in need of money. At the same time we try to keep our membership as decent as we can; but half the fellers we'd like to have now have got wind of old Mark-My-Words, as we call him, and half the other decent fellows don't come into the club simply because they're terrified of finding him there.'

'But what does he actually do?' I asked.

'In the first place he sits on all the papers. Then, when he's read them, he wanders around seeking whom he may devour. Then he begins. "I remember in seventy-two," he says, and then you're done. Of course you can get up and leave him, but before you know where you are, he's at your elbow again, and it's a silly thing to see members wandering through the club like lost spirits, with that old thing pottering after them. It's ludicrous.'

'It's very difficult,' I said, shaking my head, 'to cause to disappear one of our most prominent men.'

'Well, there you are,' said Pom. 'Take it or leave it. You might, in any case, come and have a look at him. Come and take lunch with me there tomorrow.'



That the Lambs is a very agreeable club, everybody knows. Its old rooms, its aroma of Russian leather and the best cigars, the spirit of peace that broods over it, make it one of the best escapes from this new democratic world conceivable. Pom is an excellent companion. I enjoyed my luncheon enormously. It was when we went into the smoking-room afterward that Pom suddenly whispered into my ear: 'Look! That's him over there, talking to those two unhappy youths.'

I looked across the room and saw a stout, red-faced man with white hair slightly on end—this gave him a cockatoo appearance—holding forth to two young men, who were staring at him with the fascinated absorption of rabbits in front of a snake. He was leaning forward a little, and every once and again I caught the boom of his voice and then a reassuring murmur as though his audience were trying to placate him.

'We will join them,' said Pom firmly.

We went across, and Pom, in his sweetest voice, said: 'Pendyce, I want to introduce you to a clever young friend of mine, Mr. Seymour Johnson, the future leader of the English novel. I hope we're not interrupting.'

'Oh, no, no, no, indeed,' said one of the pale young men, rising with exceeding eagerness. 'I must be going, I'm afraid. Appointment—' And the rest of his sentence took place in his boots.

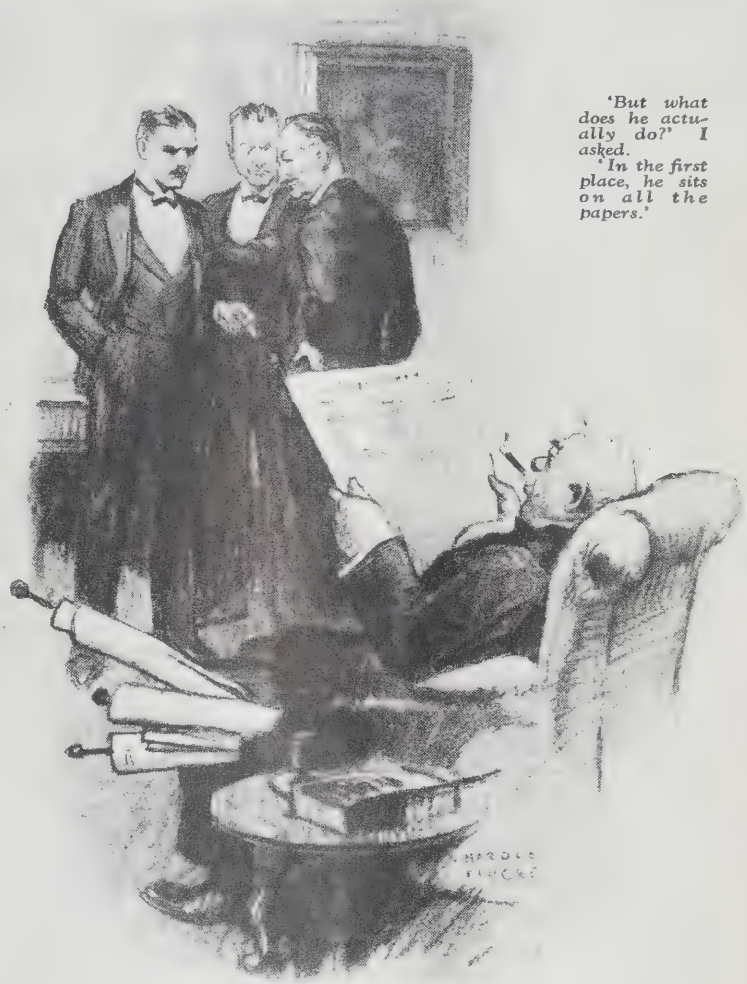
'No interruption, no interruption,' said Sir Marcus heartily, fixing his eye upon the other pale young man as though defying him to move a finger. 'I was just telling our young friends here about the eruption in seventy-eight.'

'The eruption?' said Pom, rather puzzled.

'Yes, of Mount Paphanotis in the Fijis.'

'Oh,' said Pom, 'I beg your pardon. I thought you meant that something was the matter with somebody's face. Very silly of me indeed.'

The remaining pale young man feebly giggled and made an attempt to move, but Sir Marcus's red gout-thickened fingers were on his arm in half a second. 'Just a moment, my dear fellow,' he said; 'allow me to finish my story. It was a perfect miracle of luck that I was there at all at the moment. If it hadn't been for old Casey, of the Bellerophon, turning up just in the nick of time——'



'But what does he actually do?' I asked.
'In the first place, he sits on all the papers.'

'I beg your pardon,' said the pale young man, rising now firmly, 'I really have an appointment. I'm a quarter of an hour late as it is. You must excuse me.'

Sir Marcus's red-veined eyes nearly started out of his head. 'Very well, very well,' he said huffily, 'good day, good day!' And when the young man had gone, he turned around to us, saying: 'What's happened to these young fellows nowadays? Haven't got any manners and haven't got any interest in things, either. Why, that was a most remarkable affair, that eruption. I remember it as though it was yesterday. I can see now just the shape of the island, with the bay running from east to west——'

'Yes,' interrupted Pom, 'there's nothing I'd like better than to have your account of it, Pendyce, but I see Blackstone over there waiting for me, so I'll just leave you with my young friend for five minutes and come back.'

Pom rose and started across the room with what, I afterward found, was known as the Pendyce shuffle—that is, the walk that was common to all those escaping from the embraces of Sir Marcus.

LEFT now only with myself, he was forced to consider me, and he turned round, moving with some difficulty, and his face slowly fell upon mine. I was, as it were, dragged gradually into his comprehension, first a nose, then a chin, then an eye or two, and finally all of me caught, fixed, nailed down.

'Well, well,' he said, 'everyone seems very busy today. And so you're a painter, young man?'

'No, no,' I hurriedly retorted, 'I'm a writer.'

'What do you write?' he asked. 'Blue Books? I wrote a Blue Book once on the condition of the potato disease in Eastern Manchuria. I remember at the time——'

'No,' I said, very loudly and distinctly, 'I couldn't write Blue Books. I have a very inaccurate mind. I write novels.'

'Oh, novels,' he exclaimed, 'novels, novels, novels. Now, that's a funny thing. What do you write novels for? Aren't there enough in the world already?'

'Oh, yes, there are,' I agreed with him fervently. 'Unfortunately, it's the only thing I can write. One has to earn one's living, you know.'

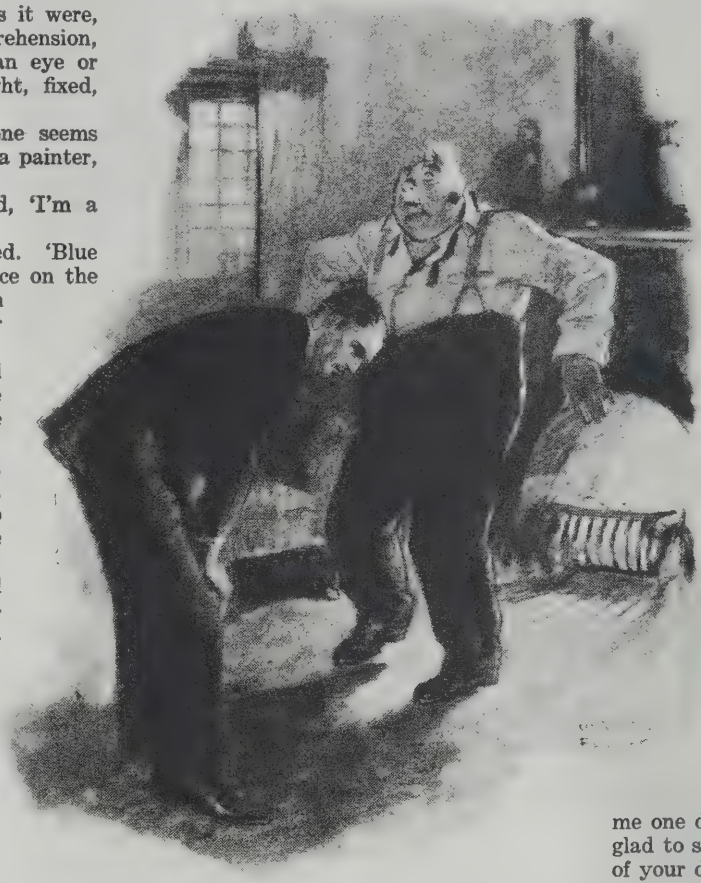
'Has one, has one, has one?' he replied.

I may remark, in parenthesis, that I was already discovering two of Sir Marcus's most irritating peculiarities, one being that he said everything three times over, the other that he was curiously absent-minded except when he was talking about himself, so that when you were at the most thrilling point of your own narrative you would see his eye wandering like a greedy pirate, wondering upon what new victims it could seize.

'Talking of novelists,' he went booming on, 'I used to know a feller called Trollope who wrote novels. Big, heavy, stupid man. Went out hunting a lot, and had the worst seat on a horse I've ever seen on anybody.'

HERE he began to chuckle over some joke which was slowly coming up to the surface of his mind, which he already perceived in the dim, blue waters far below.

'It must have been in the late eighties,' he sputtered, 'that I said a good thing to that same feller Trollope. I was in the Garrick one day, lunching with old Bony Hackett. Bony couldn't stand writing men, and when Trollope came up and joined us, he was as rude as he could be. When I was introduced to him, Trollope snorted, and that put my back up. I wasn't going to be snorted at by one of those writing fellers, so I said something about novels, you know, hadn't any time to read 'em, better things to do, and all that sort of thing, and Trollope got as red as a turkey cock, and said to me some cheek about thinking that diplomatists had plenty of time for everything, and I said'—here he began to chuckle again, and chuckled such a long time that all the clocks in the club were able to take breath, strike the hour, and recover their breath again before he'd finished—'I said—Heavens, what did I say? Well, I don't know. It was something clever about writing and all that sort of thing; and I remember old Bony Hackett was devilish amused, and told me afterward he hadn't heard anything so



I then enjoyed one of the strangest sights I've seen for a long time, Sir Marcus in his shirt and trousers shaking himself up and down.

funny for ever so long. The writing feller didn't half like it, I can tell you. Wish I could remember what it was I said. I'll remember in a minute. It was something about writing, and I know it must have been funny because Bony told two or three fellers afterward, and they all thought it was jolly good. I'll remember what it is in a minute. Oh, yes, I know—no, that wasn't it. Anyway, I could see Trollope didn't half like it.'

Here I felt compelled to interrupt.

'Must have been very interesting,' I murmured, 'knowing Anthony Trollope and all the men of his time.'

'Well, yes, it was interesting,' said Sir Marcus. 'Not that I think much of writing fellers as a whole, you know. They're a lousy lot. When I was Minister in Constantinople, there was a chap there who said he was going to write his memoirs. Furnival his name was, or Fernbanks, or Turnbull, perhaps. I can't remember exactly, but I know he had an awfully pretty wife. She was pretty, By Jove! We were very good friends, she and I. I remember one evening dancing with her at old Crawford Romanes's, and she had a rope of pearls on as big as pigeon's eggs. Finest pearls I ever saw in my life. She asked me whether I liked her pearls, and I said: "I like the neck they're on better." Ha, ha, ha! That was good, wasn't it? Ah, one was young in those days! The things one could do then! Swim, hunt, shoot, ride.

'Swim? Why, I swam five miles one night with the water so hot it fairly blistered you. That swim was talked of afterward, I can tell you. I remember a young cousin of mine there, Bertie Pendyce. Poor feller, got eaten by a shark afterward, lower half of him bitten right off. Left a wife and four children. Pretty little woman, she was, and they hadn't a penny. She married afterward young Sparkes, who ran off with that opera singer in Paris. What was her name? Large, fat, red-faced woman. She was always unlucky—Mrs. Sparkes, I mean. Devilish pretty, too, but never seemed to hit on the right man. She married a third time.'

HERE I was compelled to interrupt. I saw Pom making signs to me from the other end of the room. 'Very sorry,' I said, feeling weak as water, but determined to prove my courage, 'but I must be off. I've enjoyed very much what you've been telling me, and hope we'll have another talk one day.'

'We must, indeed,' said Sir Marcus, rising, too, and putting his arm through mine. 'I haven't had such an interesting conversation for a long time. Come along and have a meal with me one day: 5, Half Moon Street. Always glad to see you, and you shall tell me more of your doings. Hullo, Banting! Just been hearing all your young friend's adventures. Very interesting. Very indeed. I was just telling him about poor Milly Sparkes. Did you ever know her? Married a young cousin of mine. Eaten by a shark, poor feller. All the lower half of him bitten right off. She married again afterward. Some woman in the opera at Paris—can't remember her name—large, fat woman——'

'No, no,' said Pom hurriedly, 'I never knew her.'

'Well, so long, Pendyce. Glad to have seen you.'

We left the diplomatist staring after us in indignant surprise. When we reached the hall I gripped Banting by the arm. 'I'll do what I can,' I said. 'I don't know that we can bring it off, but it's a public duty. We'll do our best.'

'By Jove, you'll be a public benefactor,' said Pom, 'if you do. What are you thinking of? Leaving him on a Scotch moor, or something?'

'It will need considering,' I answered, 'but I have an idea. We'll see.'

* * *

The week that followed was one of the most miserable of my young life. I saw that to carry this through successfully it was

absolutely essential that I should make a thorough study of my subject. It was not difficult to climb into the affections of Sir Marcus. I telephoned on the morning following my first meeting with him and asked him whether I might see him again. He cordially invited me to dine with him that night. His rooms in Half Moon Street must have been among the smallest and the untidiest in London. He was in his bath when I arrived, and the table in the little sitting-room was laid for two. I will honestly confess that my heart sank when I saw that I was to spend the evening alone in his company. He shouted to me from his bath, and I saw through the open door a large red face, a large mottled red arm, and an enormous sponge. He talked then for the next ten minutes through the sponge, into which he seemed to bury his face in successive frenzies of excitement. Then, as he dressed, he continued to shout at me, and arrived at last in the little sitting-room, his white hair all on end, struggling with his collar and shouting for the valet. 'Where's Crundle? Crundle, Crundle, Crundle! Sorry I'm so late. Met an interesting feller as I was coming along from the club. He was just back from India. What he said reminded me of a thing that happened in Bombay once. What the——. This collar's too small. Where's that man got to? Would you mind helping me a moment? Just slip your finger in there. Give the stud a push, will you? That time in Bombay—oh, look out, the thing'll go if you don't take care! Got it! Take care, don't pinch my neck. Oh, Heavens, it's gone! Wait a minute.'

I THEN enjoyed one of the strangest sights I've seen for a long time, namely, Sir Marcus standing in his shirt and trousers and shaking himself up and down like a danseur learning the latest and most erratic developments of the shimmy, his eyes, as usual, bursting from his head, both of us watching in agony for the appearance of the stud. There was a little tinkle as something struck the floor, and we were then both on our knees searching the carpet. But I will not continue through the varied eccentricities of that amazing evening.

Some bores are bores because they remember so much. Some are bores because they remember nothing at all. Some are bores because they say the same things over and over again. Some are bores because their views of life are so simple that they reduce everything to nothing, and then reduce it all over again. Some are bores because they love you so much. Others because they hate you so much. Others, again, because they are not thinking of you at all, but only of themselves. Others, yet again, because they think of you so much that your natural modesty is disgusted. Some are bores because of a trick of the voice or a movement of the body. Some because they're industrious, some because they're lazy, some because they're ugly, and certainly some because they're handsome. All these bores, except the very last, was Sir Marcus Pendyce. When, after our not very appetizing meal, we were seated in front of the fire, I began to suffer with that strange desire to scream, hit somebody with a mallet, or burn the house down, which is supposed to arise only from the condition of overwrought nerves. My nerves were excellent, but there was an inevitability, a monotony about Pendyce's voice that was like the howling of a dog in the night-time, or the screaming of a peacock upon the walls of the ancestral home. Pendyce's exultation as he discovered that he had here at last a victim apparently willing, helpless, and invertebrate, a victim for whom he had been searching through so many years, was an awful thing to witness. He led me from Constantinople to Berlin, from Berlin to the Caucasus, flung me from the Caucasus into the National Sporting Club, and thence back again to the waters of the Bosphorus; then, taking me by the hairs of my head, breathless and exhausted, took me to the highest peaks of Mount Everest, hurled me thence into the purlieus of Whitechapel, then dragged me, broken and beaten, into St. Peter's at Rome, gave a final stamp across my prostrate form, then boomed away like the sea on a rocky coast.

'Well, well, it's pleasant to have a chat and find out what a man really thinks. You've opened my eyes to a lot of things tonight. One day I'll tell you a few things, too. After all, there's something in age and experience. We old 'uns know a thing or two. What says Horace?'

There began then the most dreadful pursuit of the Latin language, which, ending in a kind of apoplectic convulsion, produced only the words 'Eton, education, classics, fine thing for a boy.'

The result of this evening was that I was determined to put the plan that I had conceived into execution as soon as possible. 'Look here, Chippet,' I said, 'have you seen Charlie Black lately?'

'No, I haven't for a long time,' said Chippet. 'Why?'

'He's got to help me,' I said. 'I suppose he's in the same old place.'

He was. I paid him a visit that very afternoon.

(To be concluded in an early issue)

Belgium Tries to Get on Her Feet

(Concluded from page 1)

Government which was before the war something like 800 millions rose to approximately seven billions. Even this increase did not take into account the Belgian war debts.

For a time the deficits in the budget were covered, apparently, by foreign loans and by the activity of the government printing press. However, the Belgian Government realized the futility of these measures and proceeded with courage to the measures necessary to establish the currency upon a sound basis as compared with the money of England and America.

A first attempt at stabilization in Belgium failed largely because the loans upon which the success of the venture depended were of too short duration. The loans upon which the successful stabilization is based run for thirty years and permit the country to take at some leisure the steps to return to economic sanity.

In the first place, the Belgian Government balanced the budget by making provision, largely by taxation, that the income for 1926 and succeeding years should equal the outlay.

Americans pay 20 per cent on lodgings; English and French residents pay a 10 per cent tax. Every advertising notice is taxed, every automobile pays a heavy tax; when you get a letter at the general delivery window or when you send a telegram you pay a tax. Your restaurant receipt is taxed, and a tax stamp is affixed to the stub which the waiter keeps. In a hundred ways the visitors and the natives pay the taxes which make possible a balanced budget. In particular, also, the income tax and taxes and surtaxes upon manufacturers are designed to give the necessary income. A great protest is being made by manufacturers against certain surtaxes which cripple trade. Naturally some revisions to facilitate trade and commerce will become inevitable as the machinery of taxation gets into full motion

THE second step necessary for stabilization was to establish a credit, based upon tangible resources which would be recognized as collateral by the lending nations. To this end the Belgians mortgaged, in effect, the railroads, telegraph and telephone systems of the country.

A further feature of the stabilization is the creation of a new unit, the belga, at present wholly for the purposes of foreign exchange. The stabilization is effected at 35 belgas (or 175 francs) to the pound sterling, which is approximately 2.80 cents per franc. However, the belga is redeemable in gold, but the internal francs are not so redeemable. As belgas are redeemed in gold the francs in circulation inside Belgium must be reduced to avoid inflation.

While the belga is now only a device or a symbol and is not yet represented in actual money in circulation, it is evident that some day a new unit must replace the franc worth less than three cents. The absurdity of coins of five centimes, about one-eighth of a cent, is apparent to thoughtful Belgians. In some later revision of the units of currency it may well be that the belga will become an actual coin. The gold franc normally was worth 19.6 cents of American money; the belga is equivalent to about 14 cents. Of course to have the belga founded upon gold and the franc not so founded may create difficulties.

Fixing the franc at 175 francs to the pound sterling constitutes in terms of gold a confiscation of six-sevenths of the loans and securities issued by the Belgian Government before the war; these were issued in francs at 19.6 cents and are paid in francs at 2.8 cents. Germany did even better (or worse, as you please) by allowing the mark to dwindle to millions and trillions and quadrillions to the dollar. In this way Germany wiped out her internal debts, war debts and pre-war debts. The Belgians could not take this step without grave risk of Bolshevism.

The Belgians have been constrained by the force of circumstances beyond their power to repudiate, in a concealed fashion, their debt. But it is safe to say that no economist would advocate today for Belgium a return of the franc to 19.6 cents in gold. It was impossible and the situation 'as is' has been faced frankly by the stabilization at 175 to the pound.

Today the outlook for fundamental prosperity in Belgium is brighter than ever before. The workman works honestly and there are few unemployed. The problems of giving the laborer a living wage is agitating the best minds of Belgium and a solution leading to the general welfare of the whole working public may be confidently expected.

A South Sea Island King

An Up-to-the-Minute College Athlete *Who Plays* Baseball, *Not to Mention the* Ukulele

By WILLIAM LEE CALNON

Tufele's team in a siva-siva dance on Flag Day, Manua Island.

KINGS are in the discard the world over, and the old Tuimanua has gone the way of the rest. The last one is dead and there is on record in the chief court archives in Pago Pago a decision by Judge Sydney D. Hall that the title of 'Tuimanua' is a dead title, too.

In the Samoan language 'tui' means king, or ruler, or overlord. The remainder of the title refers to the Manua group of islands, which are now a part of American Samoa. They lie sixty miles to the east of Tutuila, on which Pago Pago is located, and consist of Tau, Olosega and Ofu, a trio of large, fertile isles closely clustered together and with plenty of sea-room between them and the other Samoan islands.

The Manua group, in olden times, was famed for its independence and the way it held aloof from the wars waged by the kings of the other islands. Strong enough to stand alone and command the respect of the others, their reigning king was always a force to be reckoned with in South Sea affairs. While Tutuila recognized the authority of the United States on April 17, 1900, Manua did not do so until July 15, 1904.

Today, under American protection, the group still is intact and like the other islands largely manages its own affairs, under the general guidance of the American governor. It has its own district governor, who is a high chief of the islands. He no longer is a king and he cannot be called Tuimanua, but he has practically all the authority of the old king and in addition to that has the backing, in his position of district governor, of the United States of America.

Tufele is the hereditary name of the county chief of Fitiutu County, Island of Tau, and a Tufele has been the district governor of the Manua group since the last Tuimanua died about 1909.

The present Tufele is a novelty—and a most modern novelty—in the line of South Sea Island rulers. There are many who wonder if his rule will last, and, if it does, how much he will succeed in modernizing his fellow Samoans. There is plenty of room for modernizing, too, as was instanced during the writer's visit to Tau on the U. S. S. *Ontario*, on which Tufele returned to his domain after a month in Pago Pago. Tufele gave a feast in his guest house, with roast pig, chickens, lobster and other delicacies on the bill of fare. Other natives gave a feast of their own in connection with the general celebration, at which seven dogs furnished the *piece de resistance*.

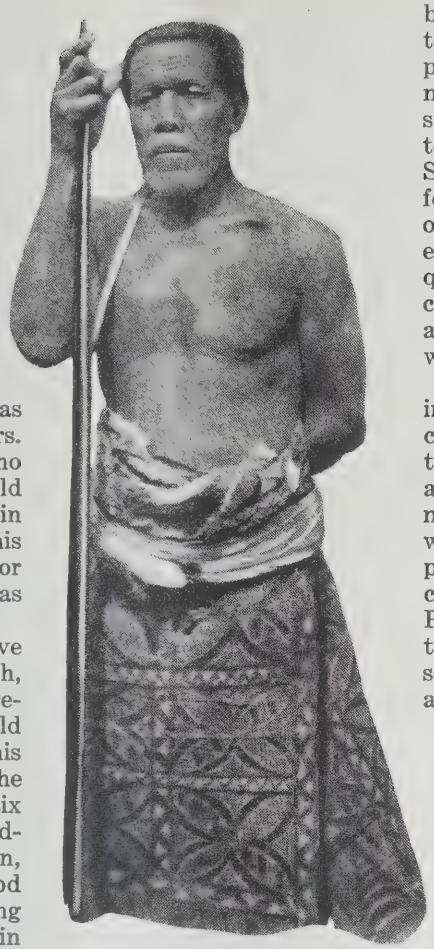
Tufele is of the type of the up-to-the-minute college athlete. Were he a student at an American university the coach would have in him a sure-fire All-American star football player. He also is a star baseball player, tennis player, boxer and swimmer; surprisingly agile for a man of more than 200 pounds' weight at the age of twenty-six. He still further resembles the campus variety of young man in his ability to play the ukulele and guitar and sing the latest song hits.

It is no accident that he possesses these qualities, for he was a high-school

Residence of the Governor of American Samoa, as viewed from pier on beach below. Center—Tufele, district governor of the Manua group, American Samoa, in 'undress,' wearing only a lava-lava.

tar at Hilo, Hawaii, n whom more than ne university scout ad his eye, when he as called home at he end of his high- chool course by his ather, 'old Tufele,' as e is termed by every ne here. The last Tuimanua was the irst district governor f the Manua group fter the American lag was raised there n 1904, and remained as uch about five years. The elder Tufele, who ucceeded him, was held n the highest esteem in ll the islands and his ule of a dozen years or nore was as successful as t was long.

Samoans often have premonition of death, nd when such a pre- nonition came to 'old Tufele' he sent for his on in Hawaii, where he ad been at school for six ears, receiving a mod- rn American education, nd under his boyhood ame of Faatoia winning ame as an athlete in nany lines.



Mauga, a district governor and one of the old order of high chiefs.

Faatoia was not the eldest son of Tufele, hav- ng a half brother who was the son of his ather's first wife. But titles among Samoans are not necessarily hereditary hrough the eldest son, and the elder Tufele showed before his death that is preference for his successor was Faatoia. When his premonition of leath was fulfilled, the family named Faatoia to be Tufele. The American governor followed precedent and made Tufele, the younger, district governor f Manua.

So the college type came into its wn in the South Seas. But it has not ad smooth sailing at all times during he past two years that it has been in ower. The clash of new ideas with ld still is going on and the questions ersist: Will Tufele win out? Will pponents succeed in ousting him? Will e become disgusted and quit?

The Samoan is long on ceremony nd dignity. He loves to have his high hief in full regalia seated in his big guest house and presiding over an im- posing ceremonial occasion. He loves o see him walking with dignity on the each, accompanied by his retinue of alking chiefs and chiefs.

Tufele the younger gave the lovers f ceremony and dignity an awful jolt fter his return from school in Hawaii. He played baseball, he played tennis, e rowed in races and otherwise acted p along athletic lines. He also got a bunch of young men together who could play musical instruments and sing. Now singing also is close to the heart of the Samoan, but he prefers chants that tell of ancient war prowess or the wooing of queens by kings, not college campus songs and the latest Broadway hits.

Further, according to all custom, chiefs should flock by themselves and keep aloof from the commoners. But Tufele when in Pago Pago, played ball with the civilian team of the Pago Pago league, the civilian team sometimes being shy a player or two because they were in jail at the time a league game was scheduled. Tufele is catcher of the team when he plays and he certainly knows how to run a baseball aggregation.

But the Samoans do not all like it. Many of them are critical of the loss of dignity occasioned by it and by other athletic stunts. They say that Tufele never will have the hold over his people that his father had. But Tufele is going ahead in his own way and his islands are prospering. The American authorities like him and his athletic prowess does not injure his standing with them.

Several years ago the Manua Islands were visited by a hurricane which practically destroyed their copra industry by wiping out the coconut groves. The groves were replanted and in 1922 produced 200,000 pounds of copra. In 1923 they produced 400,000 pounds and in 1924, the crop passed the 600,000 mark. Tufele expects that the normal mark of 800,000 to 900,000 pounds will be reached. On this subject he is all business and the prosperity of his islands and of himself depends on success along this line.

TUFELE is a bachelor. Many of his people believe that marriage will settle him down and cause more dignity to descend on him. In connection with this marriage he will follow the ancient custom, which resembles that of European royalty and its state marriages. Tufele, accompanied by his talking chiefs, will pay a visit to Western Samoa, the islands under British control. Tufele's mother lives there and has a girl picked out that she thinks may be the right kind of a wife. The talking chiefs will do the talking that is necessary with the girl's family. When they are satisfied with all arrangements, Tufele will be furnished with his bride and a gorgeous wedding will take place, with a triumphal return to Manua.

Then Samoa will see whether or not its college student variety of ruler will settle down, acquire dignity along with increased weight, and gladden the hearts of the lovers of ceremony and ancient custom by less baseball and more kava rituals.

But some of Tufele's modern ideas are bound to stick. He has his personal retinue eating with knives and forks and using napkins and finger bowls, and table manners are coming to be recognized in Tau.

The Samoan village of Aua, at the foot of the 'Rainmaker.'

The Punishment of Sisyphus

(*Continued from page 5*)

serve, and like a flash it came to me: "This is my opportunity. This is what I have been looking for: adventure and an arena to display my qualities and courage."

'The two months I spent in the Navy could not have been more uncomfortable had I spent them in hell. The moment I arrived at —— Station, I knew I had made a mistake. I became so absorbed in the conviction that my conduct was remarked upon and after a month or so I was sent up for mental examination. I recall that everything was meaningless, that any determination or attempt at exercising my will power was futile. I was like a person detached from his immediate environment. After a few examinations, I was discharged as unfit, lowered efficiency I think they called it.

'Then I went in the Flying Corps and exactly the same program was repeated, after exactly the same length of time, two months. Finally, I was drafted and went to camp in Tennessee. At the end of two months they gave me an honorable discharge.

'All the time, a voice shouted to me, "You must do something"; but I did not know how to do it. I thought possibly there was something wrong with my mental make-up, so I consulted several physicians, but without successful issue. Then it occurred to me that I would study medicine and particularly psychology. So I went to England and matriculated in Cambridge University. I stayed there a year. I had a notion that I must read and digest all the philosophers, but I got so many divergent points of view that finally I despaired of ever accomplishing the task.

'I decided to go home and think it over before going any further. I stayed home a year and went in for golf and riding and exercise and all that sort of thing, thinking that if I were to become harder and heartier, I should be able to make more sensible decision about my career. Then at the end of the year I returned to Cambridge.

'After four or five months of it I saw I was getting nowhere, and I went over to Paris, thinking I might take courses in the *Ecole Libre des Sciences Politiques* which would lead me into the diplomatic service. I arrived there in the summer and the registrar was not to be seen, so I went to the Sorbonne and matriculated for a course in psychology and ethics. After a short time, it did not seem to me that I was getting very much out of the courses, and it occurred to me that perhaps I might make for myself a career in art.

'So I began to frequent the ateliers and I got some instruction at Julian's. I kept at this during the winter and came back in the spring, stopped in New York and did some drawing and copying at the Metropolitan Museum and took some instruction from a professor in Brooklyn. In the summer, I went to the woods of Northern Michigan and lived an outdoor life, and when I returned to my home in the early autumn, I convinced myself that an artistic career was not for me.

'I was now approaching my twenty-seventh birthday. I began to ask myself insistently and continuously: "What shall I do? What ought I to do?" And I have asked myself that every waking hour for the last four years, and still I do nothing.

'What is my complaint? It is the aimlessness and futility of everything for me. My whole life is a mood of alternating depression and elation. I am either convinced that I am incapable of doing anything worth while, or I am convinced that some dramatic and spectacular career is open to me if I only can find out what it is. Everybody else in the world seems competent and confident. Only I am a failure. Is this due to a mental or a physical condition, and what means shall I employ to get a proper viewpoint and to lead me from this morass into which I am sinking on to a bit of solid earth where I can build a little temple and fulfill some of my destiny?

'I wish I could succeed in conveying to you some of my harassments. I have mental pictures of myself as a success; a well-known figure in the sport world, an applauded actor, a famous painter, a successful promoter, and realizing that I can accomplish none of them, I become more depressed and more overwhelmed with the sense of inadequacy. Added to this is a heightened self-consciousness. I can never get myself out of my mind, and all the time I feel that I am inferior in some way; and at the same time I have something constantly telling me that I am not. I realize that that seems contradictory, and it is because of the obvious contradiction that I despair of ever being able to convey to you just how I feel.

'I look like a man, I dress like a man and such acts of mine as come beneath the public eye would, I think, be called manly acts. But I know I am but the simulacrum of a man, and that is the thing that is killing me. Self-analysis is my besetting sin, and I have no urges, no desires to create the image of God, no herd urge, and I am constantly making experiment with food, alternately starving and stuffing myself, now a vegetarian, now devoted to carnivorous food. Nothing satisfies me. Idleness increases my hopelessness, activity drives me to despair. It all sounds insane, doesn't it? And yet, I am not insane because I have one quality of sanity to a remarkable degree I have insight.

'No one, no matter how deeply versed in psychopathology he may be, can see the depth of my problem and the intricacies of my predicament as I see them, and I have neither delusions nor hallucinations. My logic may be faulty and I may think or reason beyond the facts. It is for you to say whether I do or not.

'To convince you that I have insight I shall point out to you many deficiencies of character. I realize that I am a snob. I have a certain pride in tracing my family on both sides to distinctive English and Dutch origin, and in my heart I honestly feel that though persons with whom I come in contact have succeeded in accomplishing happiness and success, in

'To Me, Old Omar, Singing'

Cecil B. Ruskay.

AS CYRANO, Roxane or Dante, Beatrice loved
Their lips close-pressed against a bold acclaim,
So, too, might I, had I their courage proved,
Have closed my heart against thy burning flame.
Perhaps for this they tread Elysian Field,
Or for reward some sacred heaven gain.
Alas, their mortal dust to dust did yield;
Their bitter abnegation all in vain.
Had I had courage such as theirs, who chose
The path of pain, of solitude and woe,
Condemned to see Life weary to its close,
Nor ever warm to Love's Ecstatic glow.
Failing their strength, with 'Here and Now content,'
I hear old Omar, singing at his tent.

some ways I am better than they are. I have a cruel streak in me; I realize that I like to see people suffer and particularly people who are bound to me by ties of blood. I take a certain delight in knowing that my conduct causes pain to my mother. She would like me to be confidential, to discuss myself with her, to expose my doubts; and I can convince myself intellectually that I owe it to her to do so. There have been times when I was on the point of doing it; then the devil tempted me and I threw myself down from the mountain.

'This streak of cruelty in me shows itself in many other ways. I go to the theater as the guest of a relative. I pretend that the play offends my esthetic sensibilities in such a way that I suffer, my object being to get the person with whom I am to leave the theater, particularly when I see that she is enjoying it. I have a real delight in being solemn when someone is trying to please me, or divert me. The truth is that if I can make anyone with whom I come in contact unhappy, I am then more content with existence than at any other time, for their unhappiness or pain is a kind of compensation.

I REALIZE too that it is a hiatus in my make-up of man never to have been in love. I am not unattractive, I think, to girls and women, and I have had what is called 'experience,' but I never met a girl who could cause me to forget myself for more than a few consecutive seconds. Strangely enough, my childhood was free from sex thoughts so far as I can recall. If I went through the stages the Freudians claim every child goes through, and which I gather from your writing you believe children go through, I am unaware of it. I don't recall that I was ever intrigued with my own body or its functions; I am sure I was never singularly interested in my mother or my aunt with whom I spent much of my childhood and I never had a 'crush' on a boy, although I recall that when I was in the private school that I mentioned, I was reprimanded for kissing some of the boys.

'I believe, too, that when I was in —— School, I should have been pleased to have affectionate contact with some of the boys whose personalities appealed to me. I recall a few awkward efforts to establish such contacts, but I was repelled so vigorously that I soon abandoned them. I suppose in reality there is a considerable admixture of feminine elements in my make-up, but experiences that I had in Paris during the war and here since then, though not very many in number, convince me, when I think of the matter (and I may say to you that it does not absorb much of my thought) that I am what is called a he-man, though perhaps the second half of that hyphenated word is an exaggeration.

'This is no attempt on my part to convey to you that I have a sense of humor. I don't know whether I have or not, and that is another sign of my sanity.

'Speaking of love reminds me to tell you that I sometimes think I would like to be married, and when I ask myself why, I say, "Not for conjugality, not for companionship." I should like to be jealous of my wife. I should grant her all the freedom that I myself exact, but if anyone succeeded in interesting her, I should be profoundly jealous, and perhaps be moved to conduct which would bring some striking, dramatic event in my life.

'I like to think of the romantic side of love: to meet a girl of character and beauty, to live with her in a cottage with a creeper over the door and a rosebush under the window; to spend my day climbing the ladder of fame and to be greeted on my home-coming with praise and appreciation; to spend our evenings discussing philosophy, music, art. I can visualize it all just as distinctly as I can visualize the picture in the National Gallery that made, and still makes, a deeper impression upon me than any I have ever seen, El Greco's "Agony in the Garden." My thoughts rarely dwell upon the sensuous sides of love, and in my ideal marriage there is no unrestrained embrace, no heeltaps of the emotional cup, though I like to read about these things in heroic poetry such as that of Byron or Baudelaire.

'Once, in college, after reading *Hamlet*, the thought came to me, "Perhaps there are many like me, perhaps great characters have been tortured as I am." And I began repeating: "The thought which quartered is ever one part wisdom, and three parts coward."

'But even to be like Hamlet does not console me now.'

(To be concluded in an early issue)

What Is the Matter With Mexico?

(Continued from page 2)

beautiful works of art they were and are and will be for a thousand years; thousands of churches they built, splendidly constructed by those skilful Indian artisans. But it seems never to have occurred to the religious authorities to teach an Indian to build a schoolhouse or a decent place in which to live and raise a family. Schooling, matrimony and housing could wait on the building of great churches.

Meanwhile Colonial Spain and many of the more or less transient occupants of the presidential chair have sold the land to the foreigners and included the Indians as part and parcel of the deal. Diaz was much given to this enterprise. Hundreds of thousands of acres were traded off for nominal sums of money and other vast estates were held by foreigners with no other title than a barbed-wire fence or a company or two of privately armed troops. We waged war against the fighting Indians of the United States; in Mexico they saddled, bridled and mounted the agricultural laborer and rode him to his death; then straddled another.

Such is the background of Mexican life. As to the spirit of the ecclesiastical hierarchy that applied the power behind the throne in Mexico up to 1857, Article Four of the Constitution of 1824 provides that, 'The religion of the Mexican nation is and will be perpetually the Roman Catholic Apostolic faith. The nation protects it by wise and just laws and prohibits the exercise of any other.'

A reliable Mexican professor of history states that, 'The only religious persecution existing in Mexico has been inaugurated by the Roman Church against freedom of thought, Judaism, Masonry, Protestantism, and any other sect or individual who disagrees with the Church.' The records of the bloody Inquisition in Mexico, open to inspection in the National Museum, furnish proof of the accuracy of Professor Camargo's statement.

Article Twenty-four of the present constitution provides that, 'Every man is free to profess such religious beliefs as he may desire and to practise the ceremonies, devotions and other acts of his sect, either in the churches or in his private residence, as long as such observance does not constitute a transgression of the law.'

Article One Hundred and Thirty of the same constitution states that 'Congress may not enact laws establishing or prohibiting any religion whatsoever.'

Article Six reads as follows: 'The expression of ideas will not be subject to judicial or administrative inquiry, except in the event that such expression constitutes an attack on morality, on the rights of a third person, may lead to criminal acts or create a disturbance of public order.'

The Constitution of 1917 provides that (Article One Hundred and Thirty) 'In order to exercise the ministry in Mexico *it is necessary to be a Mexican by birth.*' And here is the center of the present conflict between Church and State in Mexico. No effort was made to enforce this measure until February of this year, when the archbishop issued a published statement saying that neither he nor any other good Catholic had any intention of obeying the constitution where it conflicted with the rule of the Church, and that foreign-born priests would be maintained in office regardless of the provisions of the law.

To this the government replied that since the Church had forced the issue, the law would be now put into effect, and the deportation of foreign-born priests and nuns began forthwith. These 'religious' could have stayed in the country, as Protestants have done, by the very simple expedient of obeying the law. President Calles issued a statement about February 25 in which he affirmed the governmental policy of noninterference with any religion, but insisted that the constitution must be respected by foreigners.

THE 'economic boycott' was later organized for the publicly stated purpose of bankrupting the country and throwing the government out of power. This failed to produce a crisis and the 'League for the Protection of Religious Freedom' was organized and began circulating printed propaganda against the government. The president of Mexico then issued the list of penalties for nonconformity with the law, to become effective July 31, and the archbishop replied that all churches would thenceforth be closed. To this the president stated that all abandoned churches would be taken over by the government and protected from violence or abuse. The archiepiscopate offered to turn the churches over to the bishop-appointed committees of Mexican laymen, but the government insisted upon appointing the committees. A tremendous furor was worked up in the closing days of July, but nothing happened.

The why of all this commotion ceases to mystify us of the North when it is known that there are three strong interests arrayed against the present administration of Mexico.

(a) The old Spanish, political, office-chasing aristocracy is not happy under the Calles Government.

(b) There are certain large American oil interests that are vitally interested in the overthrow of an administration that insists that Mexico should receive a small share of

the enormous wealth being taken from her subsoil.

(c) The Catholic party, exhorted from the Vatican to engage in 'united action' of political and revolutionary significance against the government, is also intent upon the overthrow of the administration in hope of securing one more subservient to Rome.

It is the combination of these three interests that President Calles has to face. The real issue in Mexico is the question of whether ultimate sovereignty is to rest in the pope or the president.

The cry for religious toleration need not be taken very seriously until such time as the Roman Church sees fit to relax its own iron hand. Protestants were generous in praise of the Eucharistic Congress in Chicago, which is exactly as it should be. But in 1916 the Roman Church made impossible the holding of a Protestant interdenominational congress in the city of Panama. Could such a gathering be held in any Catholic land? A little extension of that League for the Protection of Religious Freedom to other lands would be a blessing of the first order to mankind.

IT IS not difficult to locate the final objective of all this commotion and propaganda in the United States. Intervention they seek, withdrawal of recognition by the United States, lifting of the embargo on the exportation of arms to Mexico, anything to put the Calles Government out of business and bring in a régime favorable to Rome, Spain and oil.

The Mexican Government is not without strong backing, else Calles would have been eliminated some time ago. The Mexican Federation of Labor, two million strong, is standing by the president and supporting the government. And two millions of men, together with their families and sympathizers, is no mean support. Many of these are Catholics, but they are sensible men who see with clear eyes the purely political nature of the present struggle and propose to support the constitution.

The present government of Mexico is doing six major things:

(1) An earnest attempt is now being made to come to an understanding with the Vatican.

(2) The first act of the new president in December, 1924, was to reduce drastically the extravagances and over-expenditures of the government. Thousands of needless employes were eliminated within a week of inauguration, a very unpopular proceeding, but Calles is not primarily interested in popularity.

(3) The currency of Mexico began to be stabilized under Carranza and Calles has completed the process and successfully floated a gold-backed paper currency solidly guaranteed, as the present steady exchange indicates.

(4) Mexico is being policed today, as well policed as most of the United States and better than some of our larger cities. Life and property are as secure in Mexico, generally speaking, as anywhere else in the world. I read one day of a bandit-kidnapping outrage near Cuernavaca, but the next day I discovered a not too prominently displayed item to the effect that it might soon be necessary to include the Marines as regular equipment for United States railway mail cars, to end, if possible, the frequent robberies and outrages now in vogue. Occasionally one hears of riots in Mexico, religious' riots. But what of the incessant repetition of holdups, robberies, murders and crimes of all sorts in the United States? A tourist agent was besought with inquiries as to whether it would be safe for visitors from the United States to come to Mexico. He replied to all alike that if the would-be tourists thought that they could get to the border safely, the manager would see that they got back all right.

(5) Perhaps the most far-reaching achievement of the Calles Government is its policy of education for the masses. More than four thousand primary public schools have been opened since January, 1925, with a hundred and thirty thousand brown-eyed boys and girls getting a chance. Good normal schools are turning out teachers as fast as possible for this work of further reducing the present seventy per cent illiteracy of Mexico. At last the Mexican 'Indian,' that is to say, everybody, has found a friend, and if the present régime continues for a generation we shall see a new and transformed Mexico. The Mexican is in no sense a degenerate or a deficient. He is a man who has never had a decent opportunity, and when he gets it the results are highly satisfactory.

(6) If there is a more far-reaching social reformation than the land-adjustment policy of the Calles Government, I do not know where to find it. Back of all the social situation in Mexico is this land question. The Government is turning the land back to the people on a well-organized and scientifically administered policy of breaking up the vast estates and putting every man on his own little farm. No lands are being confiscated without adequate payments, except where no valid titles exist. The man who gets the land pays for it in twenty installments and the man who sells his land, albeit sometimes under principle of eminent domain, receives fair payment, also in twenty installments. An agricultural bank is arranging small loans to enable the new landowner of his twenty acres, more or less, to get tools, seeds and a start in life. And it is working well already. I have visited some of these 'colonies' and have seen thrift and industry and decent living replacing the old starvation existence of the days when land and Indians were lumped together in transfers of real estate.

SUCH are the main features of the present situation in Mexico. The writer of this is a sincere friend of the Roman Catholic Church and desires to give generous recognition to every good service that that great organization is rendering to humanity in Mexico or anywhere else. If the reader believes in the supreme temporal and political sovereignty of the Vatican, he will disagree with all that is said therein. However, historical facts are stubborn things and in time have a way of vindicating themselves. The Mexican issue is first, last and always a struggle to secure the stability and sovereignty of the government itself, independent of religious pretensions or commercial interests.

No greater political blunder could be committed by the United States than to interfere in this Mexican problem. Protestants and Catholics are being dealt with impartially by President Calles and while Catholic priests have, for reasons of their own, voluntarily abandoned their ministry, every Protestant pastor is going ahead with his work, unmolested by the government.

What Mexico needs from the United States is a little friendly sympathy and moral support. Any active meddling would perpetrate an international wrong and precipitate strained relations with every Latin-American country. They are all watching us intently to see whether we are going to keep hands off or intend to interfere in the efforts of our nearest Latin neighbor to vindicate her own right to exist as a sovereign people among the nations of the earth and to manage her own affairs. Political accomplices of the Vatican though many of these other republics may be, nevertheless their people view with vast concern the struggles of their neighbor to free herself from the shackles of four centuries. If Mexico wins out, there may be hope for them, too. If we want to incur the ill-will of the other nineteen countries of Latin America, we have only to listen to the voice of propaganda and interfere in what is decidedly none of our affairs.

Some Fiddle Vanities—the Repairer Habit

ONE of the most deadly habits of the fiddle crank is the repairer habit. He owns a violin that does not suit him, has never suited him, and never will. Instead of getting rid of it and buying another more nearly suited to his heart's desire, he fondly thinks that the right sort of repairer can adjust it cleverly enough to conceal its faults. So he goes from one to another, hoping and trusting that each will have the skill to turn the trick, until he finds that he has spent twice the original cost of the instrument on repairers who have gradually brought the box from bad to worse until it is no longer even tolerable.

The second or third repairer, if not the first, should have told him that he was seeking the impossible; that as a fiddle is in the beginning, so it is now and forever. But human nature is so constituted that, had the repairer suggested anything of the sort, the client would have suspected that the suggestion was part of a dark design to swindle him, to rob him of his fine instrument and sell him a worthless one in its place.

But no suspicion will deter such a crank. He will immediately hunt up another repairer, tell him his troubles, and swallow the assurance that this time they will all end. pay his bill, and awake next day to the realization that his fiddle is suffering from the same old malady, slightly aggravated now on account of the last unsuccessful operation.

A player should learn early this one rule in the selection of instruments: if there is any doubt, if it does not seem very desirable indeed, leave it! Buy it for its tone and let 'fit,' without regard for its place in the world of art, a very chimerical thing which today is entirely too overemphasized. Leave that to the collectors and the wealthy amateur who need amusement and have not the energy to learn to play. They have no use for tone but rave on about varnish and arches and other things whose slight differences have little bearing on the playing value of a fiddle.

Most repairers throw a top upon a rough bench, knock out a chip, or gash the wood with the utmost unconcern. Later, they rub a little black on the wound, and behold, to the uninitiated, the injury is an old one.

Training JUNIOR *for a* Home

How Lonely Little Ones *Are Given a More Congenial* Atmosphere

By UTHAI VINCENT WILCOX

DID you ever visit an orphan's home? If you have you will remember that it was a rather sad and dreary affair. My visit was. The orphanage is an institution and the atmosphere of institutional life hangs heavy about the place and even the spontaneity of childhood is not able wholly to overcome it. The place seems oppressive. Some way the average orphan's home and the average poor farm, as run by the state, have much in common—they are certainly most melancholy places—they harbor the big and little driftwood of humanity.

Appreciating all this, and a firm believer in Emerson's statement of the law of compensation, a group of people have for some time been conducting a home society in California that is different. The fundamental principle of this philanthropic organization is that for every boy and girl without a home, there is somewhere, within the state, a home where he or she is wanted.

And the Children's Home Society, as it is known, does not stop here. To assist in making the homeless lad and lassie welcome they teach them to be useful. They carefully and painstakingly inculcate habits of industry, obedience and evenemperedness. In this the sentimental is properly balanced by the practical pleasure of having another useful member about the new home.

Above—One of the living rooms of the society, offering to the little ones a homelike atmosphere and right environment. Oval—Wards of the society at play on the lawn of the institution.

It was this unique idea practically worked out that made this home a success and has continued it a success. For it is not an orphan's home or asylum—an institution that merely harbors them until they become old enough to get a job or commit a crime and thus be transferred to another institution—but it keeps them, as in a visit, until they have acquired habits of neatness and cleanliness and are ready for the right home that fits their characteristics.

'Where do the children come from?' the hesitant man or woman will ask before going very far toward adopting one of them. There's Robert, 'it doesn't seem as if anyone would let him go. Was he really neglected?'

The records of the society tell all just as far as they possibly can. In other words, they play fair with those who are coming to them to claim one of the unfortunate children. But in answering such questions frankly and candidly they remember and oftentimes remind the questioner what Luther Burbank once said: 'Heredity doesn't count for much. A child absorbs environment. Rightly cultivated, he may become a blessing; neglected, he becomes a curse.'

All legal safeguards are of course provided for both the child and the parent. That is, the society, if necessary, acts as a guardian for a period to see that the child is rightly started in his new home and then provides adoption papers. It also protects the new parents.

Every now and then a boy or girl is brought to the society to be taken care of because the father or the mother or both don't want to be bothered any more. They want 'freedom.' Yes, there are such people in the world!

Not so very long ago a young couple appeared at the Los Angeles branch of the home carrying a wee bit of their own flesh and blood which they wished to relinquish to the society. Unimpressed by the enormity of their own offense against the commonest sort of humanity, they insisted upon the society taking the child, not because of their inability to care for it, but because of their preference for the imagined freedom that would come without it.

When pleading with them to retain their own failed, the society's representative resorted to shaming, and when that failed she reproached and upbraided, all of which had no effect. The father was adamant. Finally he gave his prime reason for such a move.

'My father was a drunkard,' he said. 'From him I inherited not a taste for liquor but an ungovernable temper. I admit I have never been able to control my temper. When I get mad I simply go crazy. The baby sometimes excites my anger and if I keep it I know some day I'll kill it.'

Such inhumanity coming from the lips of a father is hard to believe, yet the statements are true in every detail. Perhaps the young man felt that to protect the child from himself he must give it away. The wife seemed willing for the sake of pleasing her lord and master. Spineless, no doubt, but people do unaccountable things like that.

It is fortunate that there is a place for such children to go where they can be cared for rightly and properly and be given a chance in a happy environment. A wise Providence has given others the true instincts of fatherhood and motherhood and they are willing to take other people's offspring into their homes to love and cherish as they would their own.

It was a truly great statement that was once made by Theodore Roosevelt:

'Just one word for the future of the country—the country as it will be twenty, thirty, or forty years hence. A good deal depends upon how we handle business, how we do our great industrial business, how we handle the farms and ranches; but what counts most is *the kind of men and women* that there are in the country *at that time.* No nation is safe unless in the average family are healthy, happy children. If these children are not brought up well, they are not only a curse to themselves and their parents, but they mean ruin of the state in the future.'

The home is, after all, the place where early impressions are formed and upon whether these impressions are good or bad depends the course that the child will steer.

How Primitive Was Prehistoric Man?

(Continued from page 13)

'The rock cavern contributed to the more rapid increase of population by protecting and saving life.'

home was his castle. In such a secure nest the elements of leisure and constructive imagination could have had an unprecedented development.

In the Neanderthal station of La Quina, in France, are found pieces of red ocher whose sides are smoothed by use. It is accepted that they were employed to color some object—perhaps quite as boys blacken their faces with burnt cork. Thus, man's body, or something he possessed, was ornamented with red paint: the beginning of esthetic life existed.

How did prehistoric man make a living? The question is easily and unequivocally answered. He had neither agriculture nor domestic animals. Thus, early he did not possess even the domesticated dog. His stone implements have been seen to be accessories for hands, feet, and teeth. Clearly he was a hunter. Also, he must have been, as all historic hunters among primitive people are, an eater of food provided by plants. He must have eaten berries, nuts, roots, grains, and other parts of plants.

Since man is the only animal species which has crossed all faunal barriers and become an inhabitant of the entire earth, and since the faunal barriers of other animal species are determined so largely by the distribution of their staple kind of food, it must be that the widespread distribution of early man was uniquely possible because he was not just an eater of flesh, or of fish, or of grain, or of nuts, or of fruits, or of roots, but because he was almost or quite omnivorous. In need, he ate whatever grew on tree or shrub, or in the earth, whatever swam, or flew, or ran, or crawled, or wriggled. With the other animals he competed for his daily food.

That he was more carnivorous than herbivorous is indicated by his artifacts. Also it is evident that he ate chiefly herbivorous animals, rather than carnivorous animals, because throughout the habitation strata containing the remains of his feasts and his lost or discarded implements, the broken bones of mammoth, bison, horse, cattle, and reindeer are commonly found—while the broken bones of the lion, wolf, hyena and other flesh-eaters are rare indeed. Their teeth are there, their skulls are there—but all evidence points to their slaughter as enemies rather than as sources of food. According to G. de Mortillet, sixty-six species of mammals alone were slain and eaten by paleolithic hunters, while during the succeeding neolithic epoch only about one-half that number were available as wild food. The others had been consumed until they were largely extinct. There is no indication that early man ate other men. Not until the neolithic epoch (as in Belgium) have the bones of men been found in the remains of a human feast.

It has often been said that the hunting-stage contributed nothing to the development of succeeding culture. This is not true.

Those paleolithic hunters, as we have seen, were physically handicapped when in competition with the other animals with which they competed daily for food. Many animals were fleeter, others stronger, others better armed or protected. Many could climb trees better than man. Many could see well at night. All, except anthropoid apes, could naturally swim. It is believed that early man did not naturally swim. Yet paleolithic man successfully hunted some sixty-six species of mammals besides the birds, reptiles, and other animal forms of life. He was thus so successful only because he was intellectually their superior.

In the hunting game man learned the feeding habits, the breeding habits, the habits of bedding down for rest, the migration practices, the temperament, the fighting or fleeing habits of all the animals he hunted. In other words, as a successful hunter he learned the psychology of, roughly, a hundred species of mammals, birds, and other game for food purposes. He knew them better than they knew him, because he outwitted them in the great game of life and death. The various devices of man by which he successfully overcame the other animals were simply intelligence tests proposed by man, but which the hunted animals could not solve.

Man killed for food such large and fierce animals as the rhinoceros, the elephant, the mastodon, and the mammoth. Fleet reindeer and horses were common food. The monstrous carnivorous cave lion and cave bear and the savage wolf and cunning hyena were outwitted, outhunted and slain. Experience in preparing and eating meat taught prehistoric man what animals furnished the best kinds of meat for eating. To the extent those animals are available today, we follow the choice of the early meat-eater, in spite of jaded taste and epicurean art of seasoning sauces.

Nothing whatever can be said of early man's religious life until the age of the Neanderthal man; but then the tale is unmistakable. Those peoples were religious. They buried their dead, and placed with the bodies weapons and personal adornments for use in the existence succeeding death. Thus, as early as Mousterian culture, man had religious belief and practice during life, and the attitude of faith in a future existence where either the man in the flesh would use his earthly things and equipment, or where his spirit would use the spirits of his earthly personal possessions.

Nothing is revealed about what influence, if any, the religious beliefs, practices and faith of those early men had on their morals or daily conduct. And, again, one can say nothing about what religious life man may or may not have had preceding the cultural time of the burial of their dead.

Whether the Neanderthal man wore clothing is not known, for no needles or buttons have been found in Mousterian culture, as they are found in later cultures. However, of course, the unshaped and unsewed skins of animals were employed for body protection long before they were reshaped by sewing.

Economically paleolithic man in Europe remained a hunter.

(To be concluded in an early issue)

Facts—Not Words

(Concluded from page 3)

prosperous in the modern sense, still it enjoyed that moderate well-being that has always signified the happiness of the people. Just as soon as we became independent we started on that series of revolutions that has prevented the Church from working out in peace its mission of morality and concord, and in some cases these uprisings have been against the Church itself.

Another accusation which the Mexican governments, from Juarez to Calles, have brought against the Catholic religion, and on which they have based their hostility to the Church and the clergy, is that the priests have mixed in politics. To this we answer that if mixing in politics is to make defense against attacks directed against religious rights, the freedom of religion, then undoubtedly the priesthood has been involved in politics beginning from the first day when the government authorities undertook those arbitrary acts under the sanction of partisan and oppressive laws.

Mexico was a Catholic country, governed by authorities that recognized the Catholic religion without denying freedom of religion to those non-Catholics who desired to live peacefully in this land. Juarez began the difficulties by withdrawing recognition from that religious organization, and the entire country was opposed to this measure, to such an extent that he was unable to have included in the Constitution of 1857 a provision annuling the recognition of the Catholic Church as a national institution. Naturally, the priesthood and Catholics in general found it impossible to keep from mixing in politics to defend their traditional religion when once attacked.

Juarez also confiscated the properties and the churches that belonged to the religious organizations, as well as all the landed property belonging to the Church itself with the exception of the churches, bishops' and curates' residences and seminaries. Of course the priesthood and the Catholics protested against such acts of despoilment.

AFTERWARD Juarez prohibited all religious orders, forbade the priests wearing the ecclesiastic garb, abolished all religious ceremonies outside the churches, and to these provisions added numerous other trammels and limitations. Again the priests and the people, seeing their rights thus attacked, protested against these measures, and with just cause, considering that for more than three hundred years they had been accustomed to hold in their cities and villages religious processions and other similar ceremonies.

How could the Catholics remain inactive in the face of laws that prevented them from having their own cemeteries, from conducting burial service, prohibiting the Mass in public hospitals, withdrawing from Catholic soldiers all spiritual solace and removing from those confined to jail the consolation of the Catholic sacraments and teachings?

In spite of all these trammels, the Church was able to drag out a miserable existence, and still survive. In spite of all these unreasonable laws, the Church was able to maintain numerous Catholic schools, so that up to the Revolution of 1913, in the most populous towns outside of the capital city, the number of children attending the Catholic institutions was greater than those in the government establishments, and the services could be decorously conducted, supported by contributions from the faithful, most of whom are poor people.

It is quite natural that all these measures caused public excitement, and this is mixing in politics for self-defense, but it is not undertaking the game of politics to attain public office—the kind of politics that interests the professional politician.

It may be casually stated that in view of the injustice and intolerance of the laws above cited, nobody deems himself obliged to comply with them; and as a matter of fact they are continually violated, at times with the consent of the authorities. In proof of this we recall that up to 1910 the government itself issued a circular at the approach of Holy Week instructing minor authorities to see that no religious ceremonies were conducted outside the churches.

WE MAY also cite as a universally admitted fact that the unjust and arbitrary character of those laws has contributed greatly to the loss on the part of the people of all esteem and respect both for laws and authorities, brute force being now the only reliance for maintaining public peace and order.

In 1917, although the Reform Laws had never been really enforced, new legislation was passed having a decidedly Bolshevik tendency as regards religious matters; these laws were on the statute books for nine years and were never enforced either by Carranza or Obregon; on the contrary, Carranza made an effort to have removed from the constitution the provisions which prevented freedom of teaching and those forbidding foreign priests to exercise their office in Mexico; but Calles, advancing the duty of the authorities to enforce the laws, is endeavoring to accomplish this in the most despotic manner, in violation of many other constitutional precepts, for he surely has adopted tyrannical methods in expelling by the most cruel methods hundreds of priests and nuns, closing seminaries, schools, asylums, hospitals and centers of Catholic culture and society; only by violating the constitution was he able to promulgate his law of last June, and Congress could not constitutionally grant him the extraordinary powers which he alleged that he held when issuing them.

THIS law prevented the Catholic clergy from continuing its beneficent mission because it requires the performance of acts which would imply a specific acknowledgment of the numerous outrages sanctioned by the law and would simply open the door to the complete destruction of the Catholic Church in this country.

According to that law, any person, even though not ordained as a priest, may register as such; any priest independent of his bishop may perform services in a church and administer a parochiate and even act as bishop in a cathedral, wherefore all the services and all discipline are entirely at the mercy of the civil authorities.

When the bishops and priests refuse to accept this destruction of their Church and submit to the arbitrary provisions of a law entirely at variance with all freedom of conscience, then the government authorities call it rebellion and dabbling in politics. But the entire civilized world, both Catholic and non-Catholic, excepting only Russia, is on the side of the Mexican Catholics.

There is no objection on the part of the bishops to conform to any agreement that the Mexican Government may enter into with the Holy See, and this would be the shortest and the surest method to put an end to all the present troubles. Bismarck, although a world figure, found it advisable to enter into a compact with Rome after his laws issued in May. France had to make an agreement with Rome in the crisis caused by its anti-Catholic legislation, and even the United States had an understanding with Rome to smooth out its Philippine difficulties. It is to be hoped that the Mexican Government will follow the example of those advanced nations.

CHATS WITH OFFICE CALLERS

'Do you know,' asked ***the Physician,*** 'that pneumonia has been made a disease subject to quarantine under new regulations by the Pittsburgh health authorities? Other cities have followed or are considering this course of action. People don't seem to realize that pneumonia belongs in the class of infectious and deadly diseases.

'The Philadelphia health authorities, while they are not requiring the quarantine of pneumonia cases, have emphasized these points: pneumonia is the chief cause of death during the winter season. Almost any cold may lead to pneumonia by increasing the sensitiveness of the patient. Colds are infectious, and each person who catches an infectious cold catches with it a liability to pneumonia.

'All these facts have been mildly taught and at times less mildly reiterated by the guardians of health. Probably folks won't like the idea of quarantine, but a sign on a house, like a mark of other infectious diseases, may teach forcefully the lesson which everybody needs to learn.'

* * *

'I asked a Weather Bureau official,' said ***the Reporter,*** 'to explain the odd fact that while my home thermometer always showed summer temperatures much higher than those of the local Weather Office, the winter temperatures recorded by my thermometer are much lower. It seemed to me that a clock should be either fast or slow, and a thermometer would be expected to be either too high all the time or too low all the time.

'It all showed up very simple when the Weather Bureau man explained it. He said that his own home thermometer varies only slightly, and at times, from the official record. Some variation can be looked for—for example, if four thermometers of the same kind are put on four sides of a building they will not agree—conditions will not be the same. But two thermometers of really first-class quality—and many thermometers are not such—will not vary greatly if exposed under the same conditions. "Proper exposure" is insisted on by the Weather Bureau. This means that the place of exposure shall admit the normal heat of summer but will not accumulate and intensify that heat, and that it will also have the normal cold of winter. The Weather Bureau, on the whole, depends on its own records, because the quality of the thermometer is always carefully tested, and proper exposure is always required. Of course, very good thermometers, exposed to different currents of cold or warm air, will differ from nearby instruments not so exposed, without impugning the accuracy of any.'

'You know,' said ***the Minister,*** 'we are impressed by the striking similarity among the names of Jewish people in Central Europe. We are also aware that they are not especially beautiful, but on the other hand, that they are often ludicrous in meaning. With the English Jew it is quite different; their names frequently differ little from their Gentile neighbors. There is an historical reason for this, closely allied with a political one. A study of the origin of Jewish family names is both interesting and instructive.

'During Biblical and Talmudical times the Jews had no family names; they were called by their given names, sometimes combined with that of their father.

'Austria was the first country to require the Jews to take family names. In case of their refusal, a name was given to them. The Jews were much frightened when forced to take a name after the fashion of their Gentile neighbors. They feared that they were to be pressed into military service, or even into something worse.

'Many of these people wept when approached by the Austrian officers; the "weeping Israelite," as they called him, was a cause for merriment among the officers, who would then give him the name Weinstein (Weeping stone). The next Jew who refused, or did not know the name to choose, was given Steinwein; and so, through a whole street, the people were given the same name in various forms. The first would be called Blaustein, the second Steinblau, the third Grunstein, the fourth Steingrun, the fifth Steinrot, the sixth Rotstein, and so forth. When they had exhausted the mineral kingdom, they proceeded to the next street, using the name tree (baum) and flower (blum), combined with mountain (berg) and stone (stein), as fancy dictated.

'In England, the family name was not imposed upon the Jews, but the matter was left entirely with them, both as to their assuming, and the appellation itself. Names of prominent Englishmen were mostly selected by them, that they might more easily gain access into Christian society, which was not then readily open to them. Hence we find such well-known names among them as: Clifford, Curtis, Graham, Hamilton, Howard, Russel and Sydney.

'The English Jewish names show another peculiarity, in that they frequently refer to Scripture. We recall in the blessing of Jacob, Genesis 49, that the sons are compared to certain animals: we see Judah compared to a lion; hence the German-Jewish name of Lowe, English Lion or Lyon; Benjamin was compared to a wolf, accounting for the frequency of the Wolfs. Naphtali was likened to a stag, therefore the name Hirsh. Ephraim was blessed with fruitfulness, and so we find the symbols of fruitfulness, Fish and Fisher, much in evidence.

'In thus tracing the origin of Jewish names, there is much pleasure to be derived, for one is ever searching for a history in a name.'

* * *

'The reading public,' said ***the Popular Author,*** as he stopped for a few minutes in the office, 'loves stories of the West. The West they love is not the West of today, all paved roads and motor cars and radio sets and boards of commerce in every village and full-blood Indians taking university prizes in poetry. It isn't even the West of yesterday, dreary and dangerous when it wasn't dreary and humdrum, with Indians occasionally killing immigrants in the hope of stealing whisky rather than from a gallant determination to protect their hunting grounds. The West the reading public loves is a synthetic tradition, built up by many western stories, by Wild West shows, by Bret Harte's fiction and Longfellow's *Hiawatha*, and other elements. I am just back from the West, and in no condition to write the kind of western stories the public loves. If I can only stay in the East and read enough of the western stories that other men have written, I may some day produce the best selling of all best-sellers, a western story with almost nothing western in it.'

* * *

'Speaking of the economic situation,' said ***the Frenchwoman,*** 'the condition of the country continues to be a subject of amazement. I suppose you remember the time when the dollar was gaily climbing the scale toward 40 francs. My own troubles prevented me from caring much about the general ado that perpetual price raises caused among all classes of people. But, anyhow, I perceived the echoes.

'I saw, in a big department store, while I was waiting for a *vendeur* (clerk), the label of a pair of gloves changed three times, and the price went up from 35 to 52 francs in a quarter of an hour. Through the windows of shoe shops, one could see the same phenomenon. Slippers were 90 francs on Monday, and 150 on Saturday. In spite of that you could hardly move in the mob which was buying, buying, buying. "Coffee has increased fifty centimes, for one pound. Let's buy coffee." And they bought coffee.

'And housekeepers bought their soap, and sugar, and clothes, while husbands bought furniture, and machinery, and a two-year provision of wine. The French gift for thrift was the provider of ready cash. I myself became the proud owner of nine pairs of shoes.

'Then came the general decrease of all prices. And the dollar is 25 francs, the pound 122 francs. You must believe in a proportional general glee. *Pas du tout!* You may suppose that shops and stores are full of buyers. But they are empty. You could think that the government can graduate *summa cum laude*. Never before, perhaps, has it been so blamed.

'Why? Because I have nine pairs of shoes that I have paid twice the price they are today. Because I can't take advantage of the low price, for I have to wait until my nine pairs will be worn out. Because people eat, drink and wear things which cost more than they are now sold for and they refrain from buying to make up for their anticipated loss.

'Workers are laid off in about all branches of commerce and industry. Big firms have to be declared bankrupt.

'When the franc was getting so thin that its recovery was almost a myth, the cry was that "Government is driving the country to ruin."

'Now the franc is getting fat enough to fear congestion; the cry remains the same.

'Who knows the way to make everybody contented?

'But I wish someone would have a liking for some of the pairs of shoes I possess, in a row in my closet.

'Then, maybe, I could buy some hosiery to wear with the remainder of my footgear. Else, I'll go barelegged.'

CAN YOU TELL ME?

QUESTION: Who was Virginia Dare?

ANSWER: Virginia Dare was the first child of English parents in the New World. She was born at Roanoke, August, 1587, and named after the district of Virginia. She was the granddaughter of John White who was governor of the colony, sent by Sir Walter Raleigh to found an agricultural state, which sailed from Plymouth, April 26, 1587, and reached the shores of Virginia in July of the same year. White's daughter was married to Mr. Dare, who was one of the assistants of the governor, and Virginia was born about a month after the arrival of the expedition.

QUESTION: Is one permitted to make wine for one's own use under the federal prohibition law? Was there a Supreme Court decision permitting wine making and why?

ANSWER: No. The National Prohibition Act defines wine as an intoxicating liquor, and its use for beverage purposes is forbidden. The Supreme Court upheld the validity of the National Prohibition Act.

QUESTION: What is the origin of Uncle Sam.'

ANSWER: In the United States the two popular national names are 'Brother Jonathan' and 'Uncle Sam.' The former was first used. General Washington, on assuming command of the New England Revolutionary forces, was in great straits for arms and war material. The governor of Connecticut, Jonathan Trumbull, was a man of excellent judgment and an esteemed friend of Washington. In the emergency, Washington said, 'We must consult Brother Jonathan.' This expression was repeated on other different occasions and became a convenient name for the whole people. The name 'Uncle Sam' is an extension of the letters U. S. printed or stamped on the Government property. It was first used in Troy, New York, in 1812. When certain goods purchased for the Government and branded U. S. were officially inspected by Samuel Wilson, whose nickname was 'Uncle Sam,' the coincidence of initials suggested the application of this nickname to the Government.

QUESTION: What was the property damage and the number of deaths caused by the San Francisco quake and the combined number of deaths caused by quakes in California since then?

ANSWER: Property damage by earthquake and fire of 1906 was between $400,000,000 and $450,000,000. The number of deaths was 458. There have been 12 deaths from quakes since then.

QUESTION: As the plumb bob was used when testing the exact location of the North Pole, how did it act? And how did the compass act?

ANSWER: The plumb bob was not used in locating the pole: the spirit level on the sextant was used. The sextant is the instrument used in making the astronomical observations which determine the position of the pole. In the Arctic regions, the force that turns the magnetic compass is very weak so that the compass is unreliable, particularly if it is used under unfavorable conditions, such as the unsteadiness of a ship or aircraft, or proximity of iron would produce. In Arctic regions, as elsewhere, the compass points in the general direction of the nearest magnetic pole and not to the geographical pole. The North Magnetic Pole is on the Boothia Peninsula north of Hudson Bay and 1,300 miles from the North Pole.

QUESTION: What is the National Industrial Conference Board? What is its function? Who comprises it? Give names of present board. Who finances it? What authority has it? What are its avenues of research?

ANSWER: The National Industrial Conference Board was founded in May, 1916, 'constituted of persons designated by and from national and state industrial associations, to provide a Bureau of Scientific Research, a clearing house of information, a forum for discussion, and the means whereby coöperative action may be taken on matters that vitally affect the industrial development of the country and all engaged in industry.' Officers are as follows: Honorary Chairman, Frederick P. Fish; Chairman, Loyall A. Osborne; Vice-Chairman, Charles Cheney; Second Vice-Chairman, John W. O'Leary; President, Magnus W. Alexander; Treasurer, Fred I. Kent; Secretary, James M. Robertson. Executive Committee, William H. Nichols, Jr., Wm. W. Coleman, Irenee Dupont, Russell H. Leonard. The list of members is too long to give in this column. It is supported almost entirely by voluntary contributions of industries represented. Research is conducted into such matters as cost of living, wages, hours of work, employment in manufacturing industries, immigration problem, tax burdens and exemptions, soldier's bonus, railroad situation, and kindred matters.

QUESTION: Can you give me some information regarding the Rhodes scholarship and how appointments are made?

ANSWER: The system of scholarships as founded by the will of Cecil John Rhodes provided in perpetuity for the support in Oxford University for a term of three years each of about 176 selected scholars from the British colonies, the United States and Germany. The scholarships have an annual value of $1,500. The Rhodes will provides for two scholarships constantly at Oxford from each state in the Union. Each scholar stays three years and receives a stipend of $1,500 a year. There are no restrictions as to the subjects which he should study. Candidates must be unmarried, between the ages of nineteen and twenty-five, and must have completed at least their second year in college. Candidates may try for the appointment either from the state in which they reside or from that in which they have received the major part of their education. The selections are made on the basis of a man's record in school and college, according to the four points outlined in the Rhodes will: (1) scholarship, (2) character, (3) interest in outdoor sports and (4) interest in one's fellows and instincts for leadership. The selections are made by committees in each state constituted for that purpose.

QUESTION: Does a preliminary search in the United States Patent Office protect an inventor on the article submitted in any way prior to actual patent being issued?

ANSWER: A preliminary search does not protect an inventor in any way. He is protected as soon as his application is filed, but not before.

QUESTION: An alien 'tourist' or visitor wants to take up his residence here. To whom in Washington or elsewhere must he write to become a 'resident'?

ANSWER: Write to the Commissioner of Naturalization, Department of Labor, Washington, D. C.

QUESTION: What is the estimated amount of coin certificates and national bank notes now in circulation? What is the amount of each?

ANSWER: The following is the circulation statement of United States money December 1, 1926:

Gold Coin and Bullion	$4,494,843,817
Gold Certificates	1,675,855,519
Standard Silver Dollars	534,991,184
Silver Certificates	461,176,717
Treasury Notes of 1890	1,343,804
Subsidiary Silver	293,369,694
United States Notes	346,681,016
Federal Reserve Bank Notes	5,186,208
Federal Reserve Notes	2,109,352,150
National Bank Notes	700,692,587
Total December 1, 1926	$8,485,116,656

QUESTION: In the January first issue of THE DEARBORN INDEPENDENT our 'Can You Tell Me?' page asked the following question: Who held office for one day between Wilson's administrations, and how did it happen that we were one day without our real President?

ANSWER: Our answer was: President Wilson took oath of office on March 4, 1917, his first term having expired March 3, 1917. He was President continuously from March 4, 1913, to March 4, 1921. To this we should like to add that the 4th of March, 1917, was Sunday; the oath was administered privately on that date, and the public oath and inauguration on the day following, March 5.

In this department we shall do our best to answer questions concerning Government and kindred matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

I READ IN THE PAPERS

America's most celebrated murder trial, the Hall-Mills case, was a 'circulation dud' as far as the majority of New York newspapers were concerned. Managing editors spent huge sums of money to get the story into their offices and played it in record space. But the circulation managers, with few exceptions, reported to *Editor and Publisher* this week that the trial had little or no effect toward boosting sales.

Hall-Mills Case Was 'Dud'

A. Bloom, circulation manager of the New York *Daily Mirror*, the tabloid that revived the investigation leading to the trial, said that in his opinion readers got tired of the story.

'It certainly didn't do much for our circulation after the trial started,' he declared. 'We got our biggest break when we first opened the case, and we got some increase in New Jersey. But in general the jumps were not very noticeable.'

The trial might just as well not have existed as far as the New York *Herald Tribune* was concerned, Porter Carrothers, circulation manager, said. 'At best the story only sold papers in spots,' he added.

J. S. Sullivan said circulation of the New York *Daily News* mounted during the trial and there was a little slump after the verdict, leading him to believe that he could credit some of the picture paper's average increase to the case. 'We have such a peculiar "critter" here, however, it is always hard for us to account for our circulation,' he declared. 'We always have a slump during the holiday season. Last year we kept the list up with a contest we were running.'

Norman R. Hoover, circulation director of the New York *World*, said the morning paper was not affected one way or the other by the murder story.

'The *Evening World* lost during the trial,' he said. 'And the week after it was ended we went up. The loss amounted to several thousand, of which we got back about 1,500 during the first week after the trial, and two weeks later we were running ahead of our figure before court sessions began.'

J. J. Winters, New York *Evening Telegram*, held the belief that comparative figures between October and November were 'hardly fair,' basing his opinion on the fact that sports were still in full swing in October and that there always was a November drop.

'We had jumps of about 3,000 or 4,000 on the big days of the trial,' he said, 'such as when Willie Stevens, the "Pig Woman," and Mrs. Hall testified. In general, however, the case had no noticeable effect on our circulation.'

A. Newman, New York *Evening Post*, was convinced that the story did not warrant the expense incurred by the newspapers. He compared the Hall-Mills circulation reaction to that of the days before the war on similar sensational stories. 'In the old days a New York newspaper frequently would jump 20,000 or 25,000 in a day on a sensational story,' he declared. 'Then we had large crews of boys who would sell our papers exclusively. We can't get the boys now. General prosperity has led them to more lucrative work. Thus we don't get much results on our extras. Of course we felt the Hall-Mills trial immediately. Our circulation went up and we had a slump right after the trial ended. The increases were not very big and on the whole the story was a circulation "dud."'

Charles A. Flanagan, New York *Times*, said he credited some of his paper's increase to the trial, but agreed that as a circulation-getter the case was nothing to brag about.—*Editor and Publisher.*

Philadelphia started out to sell the Sesqui-Centennial to the world and ended by buying it herself.—Cincinnati *Inquirer.*

One Sandy McDougall, representing Alec Robertson, a Scottish motor agent, recently appeared at a motor show in London wearing the national dress of his country. Other agents became jealous and quoted a rule which said that 'No attendant shall wear fancy dress.' Sandy was indignant at the idea of 'the garb of old Gaul' being designated as 'fancy dress,' and when asked to substitute trousers for the kilt firmly refused, whereupon he was ejected. The following letter of protest was then written by Robertson to the promoters of the show:

Barring the Garb of Old Gaul

'I wish to point out that to call the kilt a fancy dress is an insult to Scotland. If this rule is sustained Scotland may well rule that no Englishman may appear at the Scottish exhibition unless in kilts. Sandy wore the same costume the king wears when he comes to Scotland. Scotland is insulted and demands satisfaction.'

That loud clicking sound from the direction of Washington is the oil boys uncrossing their fingers.—Detroit *News.*

For the first time in its history, the state of Michigan finds itself without a boundary dispute. As long ago as 1830 there was a dispute between the state of Ohio and the then territory of Michigan which became so violent at one time that armed men gathered on both sides of the disputed boundary, ready to clash at a moment's notice. To quiet the Michigan contingent, Congress gave the strip to Ohio and handed Michigan as compensation the then vast wilderness of swamps and unsurveyed timberlands which makes up the Upper Peninsula of today. This upper peninsula had no geographical connection with the rest of the state and was an uninhabited and supposedly undesirable expanse of forest, mountain and swamp. But today its lumbering and mining operations are among the most active in America. When Congress gave the upper peninsula to Michigan it neglected to set definitely the boundary line between the new addition and Wisconsin. The line as defined on the old Government surveys was questioned and the allocation of many islands was in dispute, particularly when the country became more settled and the potential wealth of these islands became known. But now the Supreme Court of the United States gives its sanction to the old 1847 meander line, with specified awards of islands along the line. And peace reigns.

Michigan's Boundaries Are Divided

There sometimes fails to be made the distinction between free speech and cheap talk.—Portland *Express.*

Talking of the wonder of modern life, during the Miami storm a ship, a steel-built steamer, was blown on the reef and had her hull pierced in half a dozen places. Not so long ago the damage would have been considered serious enough for abandonment. But not so today. She was floated and towed into Beaumont, to the Pennsylvania docks. She was lifted, hauled inshore, examined, and before a week was out men were at work rebottoming her as a shoemaker would resole a shoe.

And stripping suggests dressing; dressing, clothes; clothes, advertisements; advertisements, the newest fashions. So there is this, the swellest, newest, up-to-datest thing in gowns, all the rage in London and finding its way here. Price $100. A Smoking Suit for women consisting of velvet knee breeches, buckles at the knee with diamond ornaments; skirt blouse of pleated ivory georgette; sleeveless coat designed on most becoming lines and banded with sable colored fur . . . So, in the words of the ballad of 'Lord Thomas and Fair Annie'

Smoking Suits for Women

Like ye best the old ladye
Or her that's new come hame?

Kind of funny that Europe's hatred of America has had no effect whatever on reducing immigration.—Arkansas *Gazette.*

The wife of Thomas R. Marshall, deceased ex-Vice-President, refuses the $5,000 annual pension which Congress has been asked to grant her. She gives as her reason the fact that the sale of the late Vice-President's memoirs have exceeded all expectations and the revenue derived therefrom is sufficient for her needs. Incidentally, Mrs. Theodore Roosevelt receives annually $5,000. President Cleveland's widow also receives $5,000 yearly. No action has been taken on the bill to grant Mrs. Woodrow Wilson $5,000 a year.

JOHN S. CASE, of Paradise, Nevada, claims to have captured in a coyote trap a rat as large as a rabbit that had killed his house cat and escaped from three gopher traps.

IN TOMBSTONE, ARIZONA, the only newspaper printed is called the *Epitaph*.

THE ART OF GLASS-MAKING was practised as long ago as 2500 B. C. by inhabitants of the Euphrates Valley, who sold their products, mainly beads and weights made from glass paste, in Egypt. So well pleased were the Egyptians that they soon imported the glass-makers themselves.

A LATE FEMININE fad in Paris is the tinting of the finger nails in bands of three colors.

THE FINGER RING is believed to have been first used as a symbol of slavery, the master putting his ring on all his household slaves, including his wives.

THE FIRST SAVINGS BANK was founded in 1810 in Ruthwell Village, Scotland, by the Reverend John Duncan.

THE COLDEST TIME of the day or night is the hour just after sunrise, declare scientists. This is explained by the fact that when the sun first strikes the earth it causes the evaporation of a chilling moisture felt by both humans and animals

BEARS, FOND OF FISH, are also good fishermen. They seem to delight in their ability and will look over their catch before devouring it with much the same pleasure as does a human fisherman.

WASTE OIL FROM AUTOMOBILE crank cases is being used in southern states to soak up sacks of sawdust and sand which are then planted in mosquito-breeding waters.

IN ORDER TO CUT COURT costs, mounted policemen in Paris will now not only arrest traffic-law violators but will also assess the fine and collect immediate payment.

THE BRITISH UNDERTAKERS' Woodwork Association predicts 'brighter burials,' following the adoption of new casket designs of beautiful and graceful workmanship.

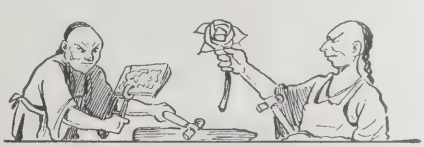
ALGERIAN NATIVES STRENGTHEN and fatten the humps of their camels by feeding them the stones of dates.

'THE DEEPEST HUMILIATION of a State is not in the loss of military prestige or of material resources, but in the degeneracy of its citizens, in the overthrow and scorn of high ideals.'—*Robert Sharp.*

A TOTAL ECLIPSE of the midnight sun is forecast for Northern Sweden on June 29, 1927. At that time the sun is visible all night north of the Arctic Circle.

THE STATES THAT comprised the Confederacy have 22 per cent of the white population of the United States and furnish 27 per cent of the officers in the army. Virginia leads the group with one officer for every 3,360 of its population.

AT THE CONFERENCE of the Women's Engineering Society in England, more than half of the women wore long hair, none had 'Eton crops' and only a few had shingles.



BLACKSMITH ARTISTS IN CHINA make landscapes and flowers out of the same metal that goes into wagon tires and horseshoes.

BALLOONING IS THE method of migration used by many species of spiders. Standing in an open space with the body elevated, the spider projects from the spinnerets a line of silk which continues until the spider feels the pull of the wind. It releases its hold as it is borne away.

TO THE DESTRUCTION of the city of London by fire in 1666 may be traced the present system of fire insurance. The first fire insurance company was formed at that time.

THE CLOCK WHICH Charles V, of France, ordered to be constructed for his palace ran for 471 years.

ONE YEAR OF THE planet Neptune is equivalent to nearly 165 of our years.

A DEPUTY CITY CLERK, in New York City, has performed 85,001 marriages within the last five and a half years.

THE DRONE BEE has 13,800 eyes, the workers 6,400, and the queen 4,900.

D. M. FREDERICK, of Kirksville, Missouri, claims to have eaten a piece of ham 125 years old. The ham had been found in the chimney of an old house in England and had shrunk about sixty per cent in size.

WHILE INSPECTING the dynamo of his car a Pullman porter on the Canadian National Railways was left on the ground when his train started. Frantic at being left in the winter wastes he grabbed the handrail of the Pullman door and clung to the rail for twelve miles. When the train stopped he was still clinging but his hands were frozen.

IN 1924, THE UNITED STATES sold in foreign lands more than twelve million dollars' worth of musical instruments. The player-piano made in Chicago is crowding out the samisen in Japan, American-made reed organs are found in British India, and in churches in England organs manufactured in St. Louis are used.

THE COPTIC LANGUAGE descended from the Ancient Egyptian, and was used in Egypt till within the last two centuries, but has now been superseded as a living language by Arabic.

THE TOMATO IS THE only new salad ingredient added by modern times. The Egyptians used onions and garlic, Confucius liked cucumbers, the Persians used lettuce and radishes with a sour wine dressing, and the ancient Chinese mixed with their salad mustard, watercress, nasturtium leaves and hard-boiled eggs.

THERE ARE 202 letters in the Tartar alphabet.

DILUTED SULPHURIC ACID carried across the river in the fumes from the pottery kilns causes the magnesian limestone of the House of Parliament gradually to turn into Epsom salts. The building has lost more than thirty-five tons of coping and sculptured parts during the last few years.

THE EXPENDITURE for education in 1924-25 by the government of India was less than 10 cents for each person of the total population.

NOTES - COMMENTS - CRITICISMS

MR. FORD'S Page this week discusses false prophets and true.

The commercial stabilization of Belgium by putting the currency on a sound economic footing forms the subject of a concise article by Louis C. Karpinski. As a result, the belga, a new coin with a gold basis, makes its bow in Europe. (p. 1)

In trying to find out for the benefit of our readers what is the matter with Mexico and what has been the matter for many years, statements by Bishop George A. Miller, of the Methodist Episcopal Church, and the Rt. Rev. Pascual Diaz, Bishop of Tabasco, are printed side by side. By going to the fountainhead THE DEARBORN INDEPENDENT has been enabled to present the most authoritative pronouncements that have yet been published. (p. 2)

Sisyphus was a crafty and avaricious king of Corinth, condemned in Hades to roll to the top of a hill a huge stone, which each time rolled back. There are many men now living who resemble Sisyphus in the nature of the results arising from their misdirected lives. The weight of the errors they have piled up through their distorted perspective is continually falling back on them and paralyzing their energies. Dr. Joseph Collins transmits to us the story of one such man. (p. 4)

Much has been said and written about the Negro—as he is supposed to be and as some people suppose he ought to be. But Townsend Boyer presents him just as he is, and some will find him quite a different being from what they thought. (p. 6)

In writing a letter which might be written by 'any mother to any daughter,' Lady Cynthia Asquith gives us a delightful bit of satire with the modern girl as the *piece de resistance*. (p. 8)

The second of Professor Jenks' fascinating talks on our remote ancestors appears in this number. Then they lived in caves. Strange as it may seem, human beings still do this in some parts of Europe, particularly along the sea coast, but they have something better than implements of stone and bone with which to kill and dress the birds and beasts they capture. (p. 12)

Anatomically, some men have flat tires. So says Myron M. Stearns. Just why men get these, and how in such cases prevention is emphatically better than cure, is set forth in the essay. The means of locomotion are important to everyone. (p. 14)

'The Garrulous Diplomatist' is one of Hugh Walpole's best. He has entertainingly pictured what Dickens made that editorial autocrat, Pott, designate 'a blue bore.' (p. 16)

A South Sea Island king who plays football, baseball, and the ukulele, and does them all in the most modern college manner, is the subject of an article by William Lee Calnon, who knows these islands as intimately as a native. (p. 20)

Doctors sometimes disagree, but in his diagnosis of THE DEARBORN INDEPENDENT this one expresses himself with a clear-cut unanimity that is highly gratifying:

> It is more than sixty years since I began to attend a country school where the teacher 'set' copy for us to transcribe. Among them was one which read: 'Many men of many minds.' It used to puzzle me then.
>
> But that it was a truism, and remains so today, the 'comments and criticisms' you publish weekly amply prove. I wonder where the divergent views originate, as expressed by different writers. It must be in the education they receive. According to them you publish the best and the worst magazine. An absurdity, of course.
>
> Your subheading—'Chronicler of the neglected truth'—in my opinion, is the hub of the INDEPENDENT'S virtue. I look with pleasure for its weekly visit to me, and its pages are full of truth verily neglected by the average publication.
>
> The 'Can You Tell Me?' department is worth the price of the paper alone.
>
> More power to your purpose to enlighten the darker spots! !
>
> Wm. E. Ziegenfuss (M. D.),
> Fern Hill Station,
> Tacoma, Washington.

> Dixie Valley, Nevada.
>
> I have just read Senator Borah's 'Reservations, the New Diplomacy,' in a recent number of THE DEARBORN INDEPENDENT and I wish every American worthy of the name could read it, and get the Reservations fog cleared from his mind. The International Bankers Propaganda would have little influence on him then I think.
>
> I am proud of your stand on Prohibition, also the Volstead Law has not had a chance as yet and never will so long as it can be used as a bone for political dogs to grow on.
>
> While your paper and I do not always agree I find it a clean and good periodical for Americans of all ages and sexes to read and study.
>
> More power to your influence.
>
> W. A. Morgan.

> Dacca, Bengal, India.
>
> I must say I've enjoyed THE DEARBORN INDEPENDENT even more here on the frontiers of civilization where such publications aren't easy to get, than I did in the U. S. A.

PROFESSOR KARPINSKI, of the University of Michigan, is at present in Europe studying political economy and kindred subjects.

BISHOP GEORGE A. MILLER has spent many years in Mexico as representative of the Methodist Episcopal Church.

THE RT. REV. PASCUAL DIAZ is a prelate born and educated in Mexico and a well known protagonist of the Catholic viewpoint.

DR. JOSEPH COLLINS is regarded as one of the most eminent authorities on neurology in the country. His former articles in THE DEARBORN INDEPENDENT attracted universal attention.

TOWNSEND BOYER is a woman of the South and has made a lifelong study of social problems of the Negro.

LADY CYNTHIA ASQUITH, daughter-in-law of the Earl and Countess of Oxford, has become a firm favorite with our readers.

ALBERT ERNEST JENKS, of the University of Minnesota, is a recognized authority on anthropology and a popular writer on the history of the human race.

MYRON M. STEARNS is a contributor to the leading magazines and has made a special study of health subjects.

HUGH WALPOLE, author of *The Cathedral* is among the world's leading novelists and short story writers.

WILLIAM LEE CALNON has traveled extensively among the islands of the South Seas, and like Stevenson, he knows and loves them.

TO THINK great thoughts you must be heroes as well as idealists. Only when you have worked alone—when you have felt around you a black gulf of solitude . . . and in hope and in despair have trusted to your own unshaken will—then only will you have achieved. Thus only can you gain the secret isolated joy of the thinker, who knows that, long after he is dead and forgotten, men who never heard of him will be moving to the measure of his thought.

—*Oliver Wendell Holmes.*

The Point of Pity

Gamaliel Bradford.

THE persecution of the clock
Involves me in its net,
And keeps me busy taking stock
Of things undone as yet.

The hurry of my eager task
Disturbs my senile breath,
Until I passionately ask
The timeless pause of death

And yet the point of pity furled
Within my spurred despair
Is that I toil to give the world
What it too well could spare.

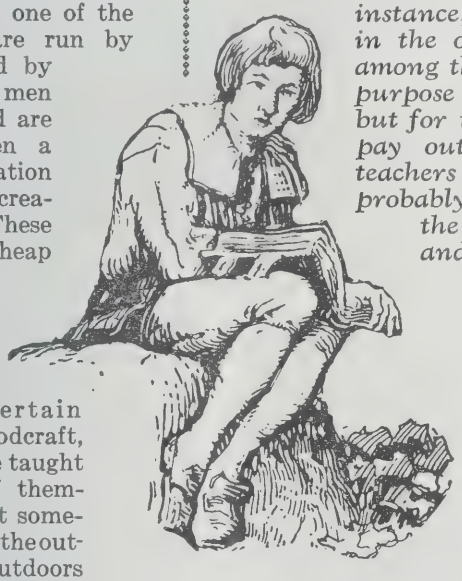
'Average'—*as the* GOAL *of* Education

Shall School Children *Be Taught That* 'Getting By' *Is Their* Chief Aim?

By PUTNAM PHILLIPS

IF WE are handing over so much of the training of our children to school instructors, what are we doing about the instructors? First, are the instructors capable of sizing up to the job that has been handed to them? And second, about what are they instructing?

No expense is spared in equipment and there are no end of capable, conscientious instructors in the elementary schools—which are the schools which count most. But also there is growing a class which considers the teaching merely as a job. For instance, some teachers are active in the organizing of trades unions among themselves, not at all for the purpose of becoming better teachers but for the purpose of forcing more pay out of their jobs. Perhaps teachers are not paid enough—probably they are not, considering the importance of their duties and the need for a single-minded application to them. That is a matter to be gone into from the educational rather than the political side. But what are they teaching?



NOT long ago, at a dinner, I compared notes with half a dozen parents on that most important and most interesting of all subjects—our children. In a moment or two we were sitting as a committee of the whole to consider the state of the nation with special reference to our children. All of the youngsters brought into the picture were between six and fourteen years old; some were boys and some were girls.

One curious fact stood out. Every child above the age of twelve had during the summer been in one of the camps which are run by teachers assisted by young college men and women, and are a cross between a summer continuation school and a recreation camp. These camps are not cheap and as a rule they are excellently run. The children learn swimming and a certain amount of woodcraft, and also they are taught to take care of themselves. They get something of the fun of the outdoors—the real outdoors away from the roads.

'These camps,' remarked one of the women, 'must be growing into a great industry, for I notice that nearly all of the department stores now have special camp outfitting sections and every one that I went into was doing a rushing business. People must have a great deal of money, for it rather pinched us to send our children away.'

'Why did you send your children away?' I asked, for I knew that scarcely anyone at the table could really afford to spend the money.

'Oh, the children wanted to go very much,' she answered, 'for all their friends were going, and it was nice to think that they could learn to swim well and to ride well and to learn to do a lot of things that I didn't have a chance to do when I was a girl. And then, too, we never know exactly what to do with them in the summer when they are not going to school. They get tired of everything and become nuisances to themselves and everybody else.

'It seems a dreadful thing to say, but I think I was glad to get rid of them for a little while. I suppose we are not like the old mothers who were willing to live for their children.'

And thus, the ice being broken, it came out that all these children had gone to camp as much for the good of their parents as for the good of themselves! As another woman admitted:

'There is nothing bad about my children, but they do get on my nerves, and then I scold them, and I do not want them to think of me only as a person who scolds.'

Now these were not flighty people trying to be fashionable. They were just good citizens of moderate incomes which they earned by their own efforts. They represented a fair cross section of the kind of people whom you can find in any town or city of the country. And yet they admitted that they were handing over the most critical part of the training of their children. But they were not doing it with their eyes shut, but, as came out in the conversation, because they thought the children paid more attention to what the teachers said than to what they said. They did not know whether the fault was with the children or with themselves, but they were frank enough to admit the facts—to admit that they saw less of their children after seven or eight years of age than did the school and camp instructors.

Perhaps this is as it should be. For it by no means follows that fathers and mothers, by acquiring the status of parenthood, also acquire a knowledge of how to train children. The superiority of the parent over the child is

often only physical—the ability to give the child a licking.

A child is directed to honor his father and mother; yet if we take this in its literal application, it is putting a duty on the child without any corresponding duties on the parents so to act that they may be worthy of honor. Those of us who are parents know that often we most unfairly punish children merely for showing the same faults that we have. It is impossible to maintain the glorified parent attitude without being a good deal of a hypocrite—or an adept at self-deception. I often wonder if our ancestors could have got away with as much as they did had they not lurked behind long flowing beards!

ONE day my boy brought in his school report, saying self-satisfiedly:

'Well, I got average.'

'What do you mean—average?' I asked.

'Oh, we have a new kind of report now. We are just marked on whether we are above the average of the class instead of getting regular marks.'

I looked at the report. It was a formidable document of four pages. The first page had to do only with the school subjects, but then followed thirty-one divisions which were headed 'Habits and Attitudes Desirable for Good Citizenship.' These divisions are interesting. The points they give importance to may be good—certainly they are not bad. But what is their real importance? And what is their trend? Here are the points:

I. PERSONAL HABITS. Stands on two feet without leaning. Sits back in chair with feet on floor. Keeps hands and materials away from mouth, and fingers away from nose and ears. Keeps desk, table, and locker in good order. Does not waste, destroy, or lose paper, pencils, books, home work, or other materials. Is in the right place at the right time equipped for work. Anticipates his needs and does not borrow. Responds to directions or requests quickly and without unnecessary discussion.

II. SOCIAL HABITS. Is trustworthy in obeying rules governing halls, recess, fire drill, and study period. Respects school property, doing his part to keep desks and walls free from defacing marks. Coöperates in keeping school building in good order. Respects authority. Refrains from unnecessary talking in assembly, during study hours, and between periods. Uses quiet tones in corridors, lunch room, and in classrooms before and after school hours. Claims no more than his fair share of time and attention, particularly in the recitation period. Is attentive when some one else is talking. Does not interrupt others needlessly. Is straightforward in all his dealings with others. Is polite in speech, manner, and attitude. Knows how to get along with others. Performs satisfactorily the duties of any office to which he is elected.

III. WORK AND STUDY HABITS. Uses time to good advantage. Does good work day by day. Hands work in on time. Concentrates upon the task at hand. Perseveres in spite of difficulty. Is accurate in his work. Is trustworthy in performing tasks independently. Finds ways and means of improving weak points and of making up work missed. Does not play with pencil, paper, and so forth, in recitation period. Volunteers in the recitation, doing his part to make it profitable and interesting.

And then I put in a few days thinking about that report. It bothered me from several angles. Putting up 'average' as a goal was almost terrifying. Were the children being taught that it was enough just to 'get by'? The report had this explanation of what was meant by 'average':

'This report is a record of actual achievement, not of achievement relative to the pupil's ability. "Average" indicates the achievement of the middle half of a representative class. It signifies satisfactory work in the case of a pupil of average ability. "Above average" indicates the achievement of approximately the upper fourth of the class. This mark signifies excellent work. "Below average" indicates the achievement of approximately the lowest fourth of the class. It signifies mediocre or poor work. "Failure" indicates that the pupil has not reached the required passing mark.'

The use of average as qualified by the explanation was not unreasonable—but that was not the effect on my boy. He was content that he was no worse than most of his class. And what was that class as compared with the world which he would some day have to meet? And then that 'habit' report! Would he gain the notion that good citizenship could be so easily defined? And was so superficial? I could not keep my thoughts to myself. I had to write them to the school:

'Dear Mr. Maddox:

'I have been a long time returning this report, because I so thoroughly disagree with its whole concept that I have felt I should write to you rather fully.

'This thing of taking an average on utterly insufficient data and then assuming that the average is a desirable point from which to begin measurement, whether physical or mental, tends toward a leveling downward and is in opposition to the development of individuality and the advancement of society.

'Statistics, and they are nearly all pseudo-statistics, are doing an immense amount of harm today, because the fall into the hands of ingenious, hard working people who take them a facts rather than as indications, an I know nothing more dangerous than resolute person armed with a fa which is not a fact.

'All this average stuff, includin these tests so quaintly called "in telligence tests," may be of some us in a rough-and-ready separation of grea masses of people, although I imagi that quite as good results in such separation might be attained by som purely arbitrary standard—such a comparing the length of the left ea with that of the right big toe. I do no know what the resulting figure woul mean, but that would be rather an ad vantage, because I would not preten to, while the averages set out in th report pretend to mean something, bu actually they mean nothing.

NOW, to be specific. The repo falls into two divisions, the first calle the Academic Report and the secon the Habit Report.

'Let us first have a look at th academic report. This report tells m nothing. I want to know what Putna is doing. I have not the remotest inte est in what he is doing as compare with the other members of his class as compared with what is called "representative" class. I do not kno what a representative class is, and doubt if the Lord has ever confide that information to anyone.

'The object of a school is to develo the pupil according to his individualit If no one in Putnam's class has an knowledge of reading, composition, language, then Putnam naturally mu be marked average in these subject and I think this must be the cas because he knows nothing at all abo them. In fact, I cannot discover th he knows anything or is learning an thing.

'And worse than that, I cannot di cover that he is interested in learni anything. There is something ver wrong indeed with the methods bei pursued, and I have a suspicion that th trouble lies in relating the work to mythical average instead of to standard of actual accomplishmen With the small classes which you hav no pupil should be deficient in an subject. If he is deficient, then that the fault of the teaching and not of th pupil. A report given to paren should not be an account of what th pupil has done. It should be an accou of what the school has done. Th burden of proof is on the school, not o the pupil.

'Of course the ultimate of educ tion is to start the thought processe We must distinguish between memo and intelligence. But no on can be taught to think. The mo that teach-

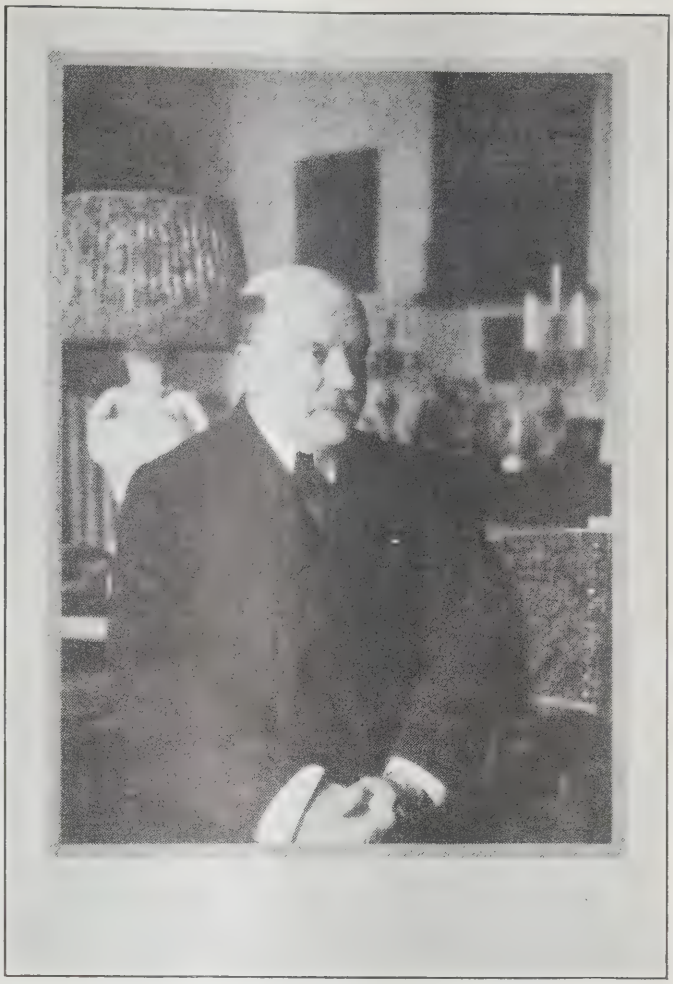
A Chat With DON PIO BAROJA

The Celebrated Spanish Writer, Who Carries on the Don Quixote Tradition

By V. S. PRITCHETT



TORN by civil war between the liberal and conservative factions in the 19th Century and living under the traditionally reactionary Bourbons ince 1876, when the brief Republic ollapsed, Spain seemed to have reached er lowest ebb of decadence in 1898 hen in the war with the United States he lost the last of her colonies. But n that year Spain was born again; nd although her story continues to be ne of military domination and po- tical cupidity, there has grown up a and of thinkers who are beginning to evolutionize Spanish thought. They re as important to Spain as the Irish iterary revival was to Ireland and have egotten in their country a definite enaissance.

Little is known about these men or heir work by the world outside. Indeed, at the mention of Spain the verage person thinks immediately of . gypsy with a rose in her hair, or of the enial King Alfonso playing at democracy and polo. Who has heard of his 'generation of '98,' as it is called; f Azorin, Unamuno, Perez de Ayala, Ramiro de Maeztu Manuel Bueno, Ortega y Gasset and Pio Baroja—a group of writers who in vitality and achievement rival the brilliant English school of Hardy, Conrad, Bennett, Wells, Shaw, and Kipling? In this Spanish renaissance one of he more interesting because less conventional figures is Pio Baroja. He is a novelist and a Basque who with typical Basque perverseness declares he does not belong to the movement at all and that the whole thing is a convenient fiction created to label and explain away history!

When I told my friends I was going to see Pio Baroja they strongly advised me not to do anything of the kind. He was celebrated; his work was recognized; he had been increasingly translated in England and America; his work had literary value and was Spanish, whereas that of the far better known Blasco Ibañez was flashy and most un-Spanish. All this was true enough. 'But,' they said, 'he is abominably rude and blunt. He will probably abuse your country and then kick you down the stairs.'

It was therefore with some anxiety that I climbed the stairs to his house in one of the older streets of Madrid—the city is young as European cities go—and as I went up, a grave, neat man in black passed me on the dark stairs. I had seen the face before. Whose was it? But I was too agitated by the prospect of meeting the angry Basque to think more about the incident.

I was shown into a typically Spanish room with white walls and old heavy black furniture against them. There were bright rugs on a polished floor clear as a mirror and with every stick of furniture, pottery and copper reflected in it as in a pool. There was an atmosphere of impeccable and glassy gravity. And in this room, against a blazing background of red damask, sat Don Pio, the fire eater, the abominable, in an old suit, without a collar, with shirt unbuttoned, blue felt slippers on his feet and a small *boina* like a cold blue pancake on the top of his head. A little black kitten was walking about on his shoulder and he was smiling genially. The whole scene seemed wrong. I had imagined a garret or a disorderly study—anything but this.

'I am afraid I must put it outside,' he said shuffling across the room with the kitten. 'My sister does not like cats and this is her house.'

He looked so mild. He was very apologetic. He hardly looked the man who twenty years before had written dramatic criticisms whose downrightness had scandalized the oily Madrid of the day. He had a face as pale as milk, pale sad eyes, pale hair, and a pale scrub of beard of a few days' growth—altogether a pallor peculiar to bakers before eleven o'clock in the morning. Moreover this *was* before eleven o'clock in the morning and—how are the mighty risen! Pio Baroja is a baker.

It was when a young man, after the hardships of the life of a village doctor in Valencia and in the Basque provinces that he became a baker. He had a good story about those early days when his brother and he ran a bakery between them. Don Pio confessed to having written stories in the account books. But it was an efficient bakery withal. One day the brothers wanted to improve the buildings. They sent their plans—as the law required—to the town council for

(*Continued on page 25*)

The Punishment *of* Sisyphus

Is Paralleled in That of a Young Man *Whose* Efforts *Get Him* Nowhere

PART II.

By JOSEPH COLLINS

Illustrated by W. W. CLARKE

THE essence of my predicament is: the futility of my life. Whatever I say or do is so insignificant, compared with that which worth-while people do, that it cannot be measured. The thing I cannot understand is how persons can be so cocksure of the value of their decisions and doings. They do things without plan or premeditation, and apparently are satisfied. I plan, prepare, investigate, and then do, and I am invariably dissatisfied and discontented. Take one instance:

'I take a train for the country. My neighbor in the seat has purchased a popular magazine and proceeds to peruse it with obvious satisfaction. I realize that such an unsophisticated condition of "where ignorance is bliss" is probably entirely as it should be in the scheme of the world, whereas I, who have eaten somewhat of the tree of knowledge, must suffer. I have brought with me, say, the literary supplement of a weekly paper. When I attempt to read, a thousand depressing thoughts assail me.

'I read the review of a book on Holbein. Although I suppose most persons interested would take this reading as good for a pleasurable half-hour, I begin to conjecture who the critic is. I secretly envy his position, as one who having struggled possibly with much confidence now has an assured position with the paper and *knows just what he wants to do* and is thus functioning in a sphere beyond my reach. Again, I cannot get the complete sense of knowing the whole situation in its proper proportions, as hitherto I have not read his writings. It is obviously impossible to know them, as the past supplements are not only numerous but unobtainable.

'Should I continue to read, the thought comes to me that Holbein led a full existence, lived through situations which I should like to have confronted. And I know that certain people, with the proper mental and emotional equipment, can make his experiences part of themselves.

'But does such an experience fit in with my scheme? How should the fact of this man's life affect me? Should I learn this essay line for line and then be able to talk about Holbein to friends, or ought I to absorb the substance of the sketch as pleasant entertainment on this journey? The hopelessness of concentrating in this looms up when I consider all the books and periodicals I have read in just this way, which will always have a vague place in my mind by reason of having read them, and therefore a claim on me somehow to search them out again and learn them.

'I have a sort of passion, not only not to miss a single thing, but a longing to have that thing under exactly the proper conditions. Thus, for example, having failed to read and completely absorb Keats' poems, I failed to discuss them with so and so, at a house party, and thus did not establish a bond of interest which might have led to pleasurable, useful intimacy.

'We have only so many hours to live, and the time wasted in skimming over such books can never return. The thought of wasted opportunities paralyzes me. I can never forget the might-have-beens. A professor of ethics in college once told us that the human being is either infinitely important or infinitely worm-like, and that both points of view are correct. I generally feel in the latter condition.

'The successful, the healthy, the confident of all ages of mankind, my contemporaries too, are serenely functioning in their spheres, rarely or never doubting that they are doing the right thing. I feel that I am treading ground, not of my own right, but by sufferance of others. The ghostly arm of self-reliant forebears has kept me from getting in touch with the realities of life.

'The successful, the healthy, the confident of all ages, are serenely functioning in their spheres. I feel that I am treading ground.'

'Had I to work for clothes, food and
ication, I might not be in my present
dicament. When I think that, I
lize that it is a cowardly shifting
responsibility.

'My moods change, depending upon
ntal, sometimes upon physical
ises. While in the army, the con-
uous aimless marching around got my
tem into such shape that I became a
t of passive automaton, racked by
norseful ideas and a fearful jealousy
every minute wasted in that particu-
camp when I could, say, be emulat-
the career of Alexander Hamilton,
pping from civil life to war in a
lliant manner.

GOT into the state where the blood
med to cease reaching my head and
as became confused. Since then, I
ve practically never reached tiptop
dition again. Before the war, the
st satisfactory times I can remem-
were those after exercise, after
iling a squad out for crew training or
-hockey practice. But these condi-
ns are so dependent upon being at
lege where teams are organized,
t they cannot be duplicated, and I
ver seem to have been able to become
sorbed in the moment and take it
its worth.

'I always look before and after.
d the inevitable has happened.
longer is it possible to lead a life
l of sport, every minute intense and
ed to the full. I do not want to live
glaring sunlight every minute. I
ow that there is a well-rounded
heme of play and work, rest and
ivity, indulgence and abstinence,
t what I have failed to do is to plunge
naturally, and enjoy the ups and
wns, the struggles and the successes
th my fellows.

'In fact, my
e great obses-
n, or call it
ssing thought,
similar to that
the Lady of
alott in her
wer, "half sick
th shadows,"
she sees the
rld go by
lected in her
rror. I agonize
ssively while
ople apparent-
are at grips
ith reality
erywhere.
d yet all the
ne I have the
surd notion
at by some
agic of thought
personality, or
me process of
ind (rear-
nging of view-
int), I can re-

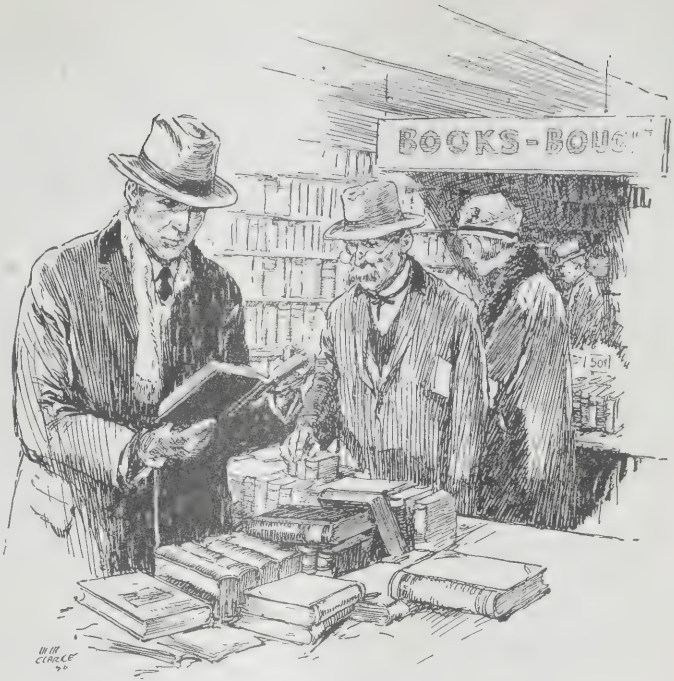
'When it's raining I actually rejoice, for then I feel I am missing nothing in the country.'

capture lost opportunities.

'Various things I would have wished to do: to have started at the proper age, in the proper channels, for the British Navy and progressed into a position there now to have lived that life; to have been preparing myself for literary work by the proper background of reading all the classics and in fact everything readable in the world up to date; to have gone to an English public school, participated in the social life there and on the Continent, the wars, and in fact to have led the romantic life to which I was entitled by birth.

'I realize now that my determination to go to an English university was an eleventh-hour attempt to snatch at these fleeting opportunities and although I was somewhat over the age of the average undergraduate when I went there, I somehow felt that youth might make me the exception. I would still be going and the time not lost. Even now, I refuse to admit that such times have gone by, and actually entertain the idea that all can still be accomplished and experiences, studies, athletics, friendships, and so forth, can be in store still, as if I were not yet twenty.

'Undoubtedly the obsession of human relationships comes in here. I joined the Naval Reserve when we entered the war, preferably to other services, because I thought I would there be able to find the companionship of a better type of young man, handsomer, more daring and more interesting. I was attempting to approximate Gil Blas with a life of romantic escapades; novel points of view and significant of getting the most out of a commonplace world. But while caged at the naval station, I had not the courage to act on any ideas, nor to grasp the realities of the situations, and was constantly imagining the intense and exciting activities of others to which I was not a party.



'I search the bookstores for some outside aid, hoping that some day the secret may be solved.'

'My passion for the complete fitness of things leads me to dwell on the doings of royalty, not from any snobbish point of view, but from the fact that these things are on a high plane. The interesting and dramatic sides of life are expressed to the full. Large dances and balls are attended, and then without loss of time in details, such as struggle for transportation, clothes, and the like, a race-meet in the hunting field where the best are gathered together. Possibly life is just as boresome and perplexing to them as to others. I am merely using this as a symbol for ideas.

'On the other hand, the other side of life—human nature without any external advantages or preferment—appeals to me: for example, that which is happening in the great regions of the West, and of Canada. Here the weather is foul; there the sun is shining, and I cannot get my share of it. The healthy, un-self-conscious youth of the land, boys and girls, are living their lives and not missing anything. The universities of the Middle West, private and state, the football games, the house parties, the hikes and episodes that take place; I feel that I should experience them all. I would be inclined to tabulate such opportunities like a German Ph. D. and do them all. Every experience comes under my yearning —sort of a Walt Whitman obsession with everything of equal value.

'One reason why I probably could not bring myself to (*Continued on page 21*)

Ontario Thinks *Government Control* May Be DRIER Than *Prohibition*

By CHARLES VINING

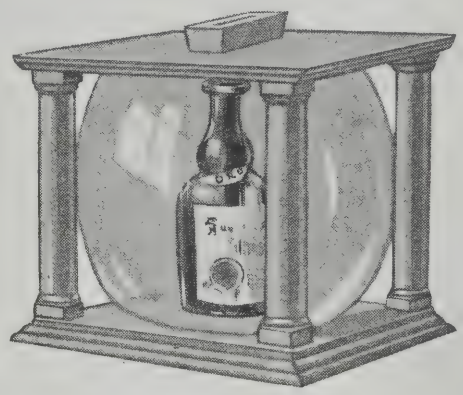
THE province of Ontario has performed the social phenomenon known as 'going wet,' and thus ends prohibition in Canada from the Pacific Ocean to the Atlantic. In six of the nine provinces liquor is now to be sold to the public by the provincial governments and in the only corner of the Dominion where a prohibition law remains, the little group of maritime provinces wedged in between Quebec and Maine, there are already displayed the symptoms of restlessness which introduced the final stages of the Ontario relapse. The Ontario vote is merely the latest, though perhaps the most significant, voice in a Canadian chorus against prohibition of liquor by law.

Apparently the chorus is not unpleasant to American ears. It has been presented in American newspapers to tunes varying from a solemn anthem of constitutional liberties which the states of the Union are supposed to have lost to a mere rollicking drinking roundelay, but always there has been approval and sometimes envy. This is entertaining to the reader but it is not without risk. To present Ontario as an example for democracy is a safe way for a newspaper to discuss the liquor question, because it has little relation to liquor. But to offer Ontario's vote to the thirsty of America as an omen of an approaching era of alcoholism is unkind. It is a building of false hopes, *for Ontario's vote is not nearly so wet as it looks.*

NOBODY can deny that it looks wet because the social experience and reputation of Ontario has been consistently anti-alcoholic. When prohibition came with the passing of the Ontario Temperance Act as a war-time measure in 1916, it was the natural sequel to efforts which dated back to 1852. Fifteen years before Canada was a dominion, Hon. H. C. Cameron introduced in the old Assembly of Upper and Lower Canada a bill to restrain the manufacture, sale and import of intoxicating liquors.

This was prohibition sixty years before its time and to a stricter degree than Ontario has ever practised, and the bill died a natural death. It was followed, however, by a long series of petition and legislation which saw expression against liquor growing constantly clearer and stronger and culminating in the ten years from 1906 to 1916. During this latter period Ontario had a local option system under a 'three-fifths clause' which required a majority of three-fifths to make a community dry. At the beginning of the ten years the province had 187 out of 784 municipalities dry; in 1916 there were 572 out of 851 dry.

Thus the way was prepared for the enactment of the Ontario Temperance



Act in 1916 under a Conservative administration headed by Sir William Hearst. Prohibition was no shock. It was put into operation merely as a government measure without appeal to the voters and accepted and even acclaimed by a public eager to make any sacrifice to win the war. *One of the ministers in the administration which introduced prohibition was Hon. G. Howard Ferguson who now has been elected to destroy it.*

Three plebiscites, held in 1919, in 1921 and in 1924, record the trend of Ontario's sentiment on prohibition and supply the stage setting for the vote of December first.

The first plebiscite showed no distaste for prohibition. On the contrary it gave a surprising sweep of approval. Four questions were asked at this time in 1919, the two main questions being:

> Are you in favor of the repeal of the Ontario Temperance Act?
> Are you in favor of the sale of liquors by government agencies? (This is the system for which Ontario has just voted.)

The answers to these two questions gave overwhelming endorsement of prohibition, the Ontario Temperance Act being supported by a majority of 405,427 and a government sale system being opposed by a majority of 235,164. In the same year Sir William Hearst and his government were turne out of power by the temporary novelt of a farmer party.

Prohibition in Ontario at this tin prevented only the sale of liquor withi the province. It did not prevent in portation from other provinces countries and this developed to such degree that two years later, in 192 the public was asked to express opinic on the subject of importation. The m jority opposing it and favoring furth strictness of prohibition was 166,83

Thus from 1852 to 1921 the progre toward prohibition in Ontario was u broken and even five years of Ontar Temperance Act experiment seemed produce a substantial desire on the pa of the public to make prohibition mo severe.

In 1923 the farmer governme passed out and the Conservatives r turned to power by a huge majorit this time under Hon. G. Howa Ferguson, Sir William Hearst havi retired from politics after the disast of 1919. The new Ferguson Gover ment was at once harassed by a w element both within and outside i ranks and in October of 1924 it held t third plebiscite on prohibition. was a straight choice between t Ontario Temperance Act and gover ment control and this time a change sentiment became evident. The Te perance Act was sustained, but only a vote which split the province in two almost equal camps, the majori for prohibition being only 33,915 in total vote of 585,676 to 551,761.

ON December 1, 1926, Mr. Fergus made the provincial election the c casion to invite Ontario to return hi to power on the understanding that would replace the Ontario Temperan Act with a system of government co trol, the same alternative which result in rejection of government control t years ago. This time Mr. Ferguson a government control were put into pow by 74 seats out of 112. Of the 38 sea left in opposition, five are definitely favor of government sale. Next spri Mr. Ferguson thus will control 79 sea and 33 will be against him. Distri after district which has always favor prohibition voted this time heavily favor of government control as a su stitute or showed complete change opinion. On a compilation of total f ures at the time of writing, the majori in favor of government control 248,000.

It is easy, however, to make wro

ductions from this fact. It is not safe assume that any wave of wetness has veloped in Ontario. There were in-uences in the recent vote which were t present in the three plebiscites and ey spoil such simple deduction. Two the main complications were party d church.

HE three plebiscites on prohibition d only one issue, liquor, and no litical party ventured to suggest to e voter what he should do. Political rties in fact endeavored to avoid com-tting themselves at the *plebiscites.* e recent vote, however, was an *ction.* In a province which is tradi-nally Conservative, a Conservative vernment was urging that it be re-ected to office, and after reëlection it uld settle prohibition.

This condition created two highly certain factors which had not existed the plebiscites. These were dry Con-rvatives and wet Liberals. The un-rtainty was whether they would give eference to party loyalty or to social nviction. The outcome makes it pear that dry Conservatives voted ainst prohibition for their party ile wet Liberals voted against their rty for their liquor. This is perhaps e natural working of human nature. e wet Liberal was seeking something wanted for himself and his impulses re positive. The dry Conservative d merely a thing which he did not nt for himself but which he wished to ep from others and his impulses were gative.

RESULTS in constituencies which re formerly both prohibitionist and nservative show how this influence erated. Of the 77 seats held by Con-rvatives in the last parliament of ntario, 45 were consistently prohi-itionist. Practically without exception, the recent vote these 45 Conserva-ve districts stayed Conservative and serted the Temperance Act. The erage majority for the Temperance ct in 1924 in these ridings was 2,800. he average majority for the Conserva-ve party in 1923 was only 800. Yet is time in almost every case the pro-bition majority was wiped out and a nservative majority substituted. To this meant not only that dry Con-rvatives chose party before prohibi-on, but that wet Liberals chose quor before party.

Church organizations have always layed a part in Ontario's votes on the liquor question. This time, however, there was the powerful United Church, formed three years ago by the merger of the Methodist, Presbyterian and Congregational denominations, and this time it was not only the liquor question but politics in which the church was exercising its influence.

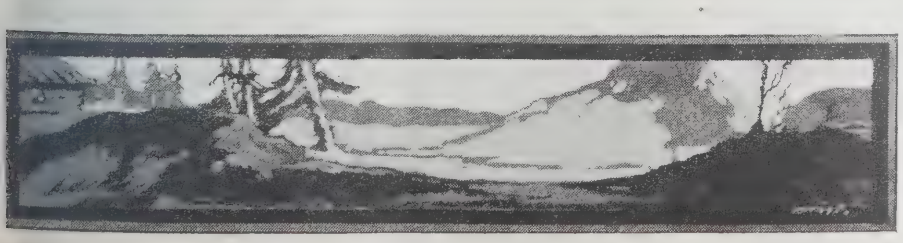
The United Church emphatically backed prohibition and urged from its pulpits the defeat of the Conservative government and Mr. Ferguson. A suspicion was whispered that the United Church was seeking to wield temporal power. The Anglican Church, the Roman Catholic Church, and those Presbyterians who had declined to join the union arrayed themselves against this possibility and openly advocated Mr. Ferguson and his system of government control against continuance of the Ontario Temperance Act.

THE denominational complexion of the campaign was unique and definite. Just as the pull of party affiliations was a new complication in the liquor vote, so the rivalry of churches was a factor which distorted the question from a simple issue of wet or dry.

The form of government liquor sale which will now be established in Ontario is a matter of speculation. The new provincial parliament will be summoned in the latter half of January and the liquor system will be proposed in the form of a government bill. This must pass three readings of parliament before it becomes law, during which process it will be the subject of debate and discussion in spite of the wide margin of parliamentary power which the government will wield.

The expectation among friends of Premier Ferguson is that details of the system will be left in the hands of a commission appointed by the new act and directed by a man to whom Mr. Ferguson has already referred as possessing public confidence. It seems unlikely that the new system can be made effective before the middle of April or the first of May.

IT MAY be repeated that Ontario's vote is not nearly so wet as it looks. Legal liquor has been voted into Ontario not by drys who have suddenly become alcoholics but by drys who remain dry and who have been actuated against the O. T. A. by a variety of motives not the least of which has been a belief that government control may be drier than prohibition.



The Social Lobby

A Favorite Game *at* Washington

THAT there exists in Washington an institution known as the social lobby no political observer will deny. Like other 'invisible empires,' it is an evasive entity. It is the rock upon which innumerable committees, investigations and bills have been wrecked.

The Constitution of the United States provides for three distinct branches of the Federal Government; the social lobby provides for the fourth. It penetrates into all governmental activities, and no branch of the Government has been free of its influence. Hospitality is the mask under which the social lobby works, but the velvet glove of comradeship has been known to conceal the proverbial brass knuckles.

The rules of the game are accepted with complacency by Congress after Congress, and administration after administration. 'Watch the columns of the Washington papers' has become a byword. Dining a Senator or a Congressman at once sets the cross-purpose-puzzlers working.

THE late President Roosevelt once said, in reference to a socially ambitious candidate for the mayoralty nomination of an eastern city, that: 'What the professional politician would do for money,—would do for a cup of tea.' What the professional lobbyist will do as a business proposition, the social aspirant will do for a dinner or a place on the receiving line. The subversive feature of this brand of lobbying is that it is effective. The Senator, or the Congressman, or the secretary, or the commissioner, or other functionary of the Government, succumbs; whether through the importunities of a society-bedazzled wife or daughter, or for personal advantage, matters not; the results are the same. The public pays the bill for the lobby out of the increase in the family budget; family clothes; family bread; family coal; family meat; and even the family amusements, such as motion pictures, for each abandoned investigation means that the public continues to pay. That it was thrown into the discard through the activities of the social lobby makes it the more criminal, for the lobby offers personal benefit in exchange for public betrayal. It is in this scramble

to 'deliver' that the female indeed becomes more dangerous than the male.

The stock market, as well as the high cost of living, is a fair barometer of the manipulations of the social lobby. Within the present generation a 'leak' in a President's message is known to have enriched the faithful of an entire administration. Wall Street is invariably in a position to discount a proposed change in the Federal Reserve rate. A Supreme Court decision, known in advance, an Interstate Commerce order typed off—just in social chat—but the knowledge is invariably in favor of the 'insiders' who know when to get out, at the expense of the 'outsiders' who didn't know when to get in. How is it done?

Accurate evidence have I none,
But my aunt's charwoman's sister's son
Heard a policeman on his beat
Say to a nursemaid down the street
That he knew a man who had a friend
Who said HE knew when the war would end.

The stock market is to American society what the race course is to French society. And brokers must make money whether the 'market' goes up or goes down, whether the Federal rediscount rate goes up or down, whether the public buys, or sells, or is sold.

Of course 'tips' and 'leaks' and 'inside information' are not delivered through amplifiers, any more than palatial mansions and racing stables are produced from the proceeds of official salaries.

IT HAS become the vogue for monopolistic industries operating in violation of the anti-trust laws to employ ex-officeholders for the purpose of swerving investigations and obstructing legislation, through their *entrée* to the social lobby or their 'inside' connections. Women who, through a combination of political and social affiliations, are most useful in lobby activities are given strategic positions in their respective organizations. These women, when necessity demands, can switch their lobbying activities to Newport, Palm Beach, California, a yacht, or if necessary an ocean liner. Devious indeed are the ways of the social lobby. 'Watch the Washington papers?' Bah! Begin with the Washington papers; then read the *Congressional Directory;* then the *Congressional Record;* then, if one lives until they are issued, the investigation reports; then the bills voted out; then the New York papers, the San Francisco papers and the Paris *Herald.* If one is faithful to this primary course in following up social lobby, one may obtain a faint residue of information by the end of the session.

Advantages of a VIOLENT TEMPER

By LADY CYNTHIA ASQUITH

Drawing by RICHARD BROECKER

IF CERTAIN virtues are their own reward, others are heavily penalized. Severe and unavoidable sufferings attend the punctual, and I question whether some people do not pay an equally high price for the upkeep of good tempers. Is not anyone who is conspicuously good-natured sure to be taken advantage of? Just as we overdrive a willing horse, so we presume on a long-suffering friend. Security makes tyrants of us all. If you establish a reputation for a reliably good temper, be sure you will be badly served, kept waiting for hours, and generally what is called 'put upon' during all the course of your meek life.

What a dreadful fate and how easy to avoid! Two or three spectacular ebullitions of rage in early youth will save any amount of trouble in after life. A well-established reputation for explosiveness will get three times as much work out of your domestic staff, make your friends punctual, your children obedient, the very tradesmen solicitous to please. So, putting it at its lowest, just consider what a saving of time and money a well-advertised violent temper represents.

You see, most of us will do a good deal to avoid a nasty flare-up. I don't know why we should so greatly mind any display of fury, but that we do mind it is certain.

When we were children we dreaded anger for itself, quite apart from any possible consequences, and we have never outgrown this natural shrinking.

Once I have seen someone in a real rage, ever afterward I treat him (or her) with the greatest respect. Very, very softl do I tread . . .

In these days I doubt whether an of us can afford the luxury of a not riously good temper. Will it not be to heavily taxed? This being so, shoul we not instruct our children to assum an anger if they have it not, and ou selves broadcast the ungovernable vi lence of their tempers so that they ma be as privileged as kicking hors who wear red ribbons on their tai and therefore have the narrow gat all to themselves? I believe our daug ters need lessons in scolding quite urgently as they need lessons in dancir or in housekeeping. A 'rage clas would be a good novelty for a scho mistress to introduce into her cu riculum.

'How to be well served—a cour of six lessons in scolding.' 'How stamp the foot and flash the eye.'

Newspapers should advertis correspondence courses in 'Profitab Violence' and Coué devotee nightly mumble, 'Every day in ever way my temper gets worse an worse.'

A well-established reputation for explosiveness will get three times as much work out of your domestic staff.

MR. FORD'S PAGE

OF THE DEARBORN INDEPENDENT

IT WOULD not be amiss if more of us took for a motto one which has been implicit in this Page since its beginning. Worded in many ways, perhaps the simplest form is this: 'Everything has been all right *up till now*.' As a working rule it has many advantages:

It furnishes a sound philosophy of human experience. While not so blindly optimistic as the motto, 'Whatever is, is right,' it makes clear that whatever *was* right may not justify the verdict that it *is* right still. In the abstract many, many things are wrong and cruel, but our only hope of being rid of them is that they shall continue until we *see and feel and know* them to be wrong and cruel; then we will get rid of them. We may say of anything that we have just discovered to be a wrong that 'it was all right up till now.' That is, if actual wrong teaches us how wrong Wrong really is, the lesson is good as long as we need it. Beyond that, no. As individuals and as a race we pass through stage after stage of experience, and as we emerge from each we cast off what seems worthless; but how could we have known it worthless had we not trusted in its worth and found it wanting? We can say of any experience that brings us to clearer vision, 'it was all right *up till now*,' but now it is all wrong because its work is done.

It separates the Past and the Future by inserting a Present. We are, as a rule, more conscious of the past and future than of the present. Retrospect and ambition, the backward look and the adventurous forward leap, are far more natural to us than realization. To *realize* is a very present act. Regrets for what we have done, hopes for what we shall do, usually swallow up realization of what we *are* doing. The Past is in us, but it is subject to the present. The Past is not fixed, but pliant—one's past is what he makes it—and the same past changes its values according to the wisdom with which the Present views it. That is the extreme value of the Present—it determines both Past and Future. Yet the Present interests us least of all. Still, the Present is all there is, and both past and future are in it. 'Everything has been all right *up till now*.' *Now* is the time! There is no time like *now!* 'Act,—act in the living present.' We may well consider any motto that emphasizes the Now.

It robs the past of all its power to breed hatred or regret. That is hardly the way to say it, for the past breeds nothing that the present does not sire; but with our motto the past yields no nurture for hatred and regret. Think of the ancient hatreds kept alive in the world. It is true that bigotry, cruelty and injustice of every kind have marked the course of mankind; but now that we know it, now that it has been demonstrated in the laboratory of life what these elements are and what their action is, was it not worth it? Our forebears would have counted it worth all the cost to teach us the nature of these wrong passions. It takes two sides to fight out a wrong, just as it takes two sides to establish a right. All human struggles must be estimated as active researches in the laboratory of experience, with after generations the beneficiaries. Why should we feel called upon to continue dead antagonisms? They have served their purpose. This race did thus and so; this church persecuted in this or that manner; this class of society oppressed after this fashion or that—very well. And all of them were resisted. And resistance brought balance and sanity. And we reap the good harvest. Let us not galvanize dead quarrels; let us say, 'Everything was all right, *up till now*.'

This motto impresses a clear duty upon the denizens of Now. Responsibility is fixed upon us; no easy-going philosophy can release us from it. When we speak of a 'clear' duty in the light of our motto we mean, first, a duty that is free of the frictions of hatred, prejudice or revenge, and second, a duty that is clear from any doubt as to the time for its performance. It is probably true that if we approach a task with feelings of hatred or revenge in any degree, it is a sign that we have not been appointed to that duty. There are at the present day many seriously harmful tendencies to be turned aside, many boastful and subversive powers to be fought and driven off, many strongholds of ignorance to be opened to the sanitary light of the sun, many inequalities resting on foundations which must be shaken; certainly it is no easy-going time in which we live. But these things must be done without the ghosts of old hatreds and prejudices clogging our efforts, they must be done in the clear and untrammeled knowledge that the hour of certain evils has struck, and they must be removed. A clear duty is clear of hatred and clear of impediment as to the destined hour. Destiny's hour is every hour, for something.

The universe is quite easy under these problems and yet quite active with them all. Our motto also has these two qualities: ease of attitude and activity of life. If everything has been all right *up till now*, we may feel easy about the process of the universe and unite ourselves with it in the full duties of the Now. We achieve something like trust concerning the past and faith concerning the future, with an inspiring sense of responsibility toward our Present.

IF YOU could get hold of a philosophy that would take all the hate and regret and prejudice out of the past and put you into possession of a fresh new Now, would you take it? Of course you would. We want the past honestly capitalized, the present naturally energized, and the future enriched by a creative faith—don't we, all of us? Trust for the past, faith for the future, strength and courage and vision for the present?—Yes. Well, it is all wrapped up in a simple motto—'Everything has been all right, up till now.' This Page tries to tell some of the implications of such a motto. Maybe you can see still more.

'Ford Ideals,' 452 pages, cloth bound, contains 98 of these articles. Postpaid $1.00.

EDITORIALS

OF THE DEARBORN INDEPENDENT

Hens Know More

CERTAIN students of divinity, raw material for future clergymen—of the kind the Church gets for her sins—proclaimed their absolute determination not to defend their country, homes or altars under any circumstances. These most prostrate victims of the alien policy of hamstringing the United States are to be more pitied than censured. It is quite probable that even without their declaration they would have been just as useless in national defense as they now wish to be. Men of their kind usually are. We make exceptions, of course, for the red-blooded, honestly born, American-hearted young fellow who has been misled by a false idealism; he will come out of it all the better for the infection. But for the other kind, the natural coward and selfish skulker who would screen his hide behind a ready-to-wear cloak prepared by the alien pacifists, we leave him to the course of nature. If he succeeds in entering the Church it will only be an indication of how rapidly the Church is disintegrating. And those whom he can harm will have left the Church before he can go very far. Imagine in your pulpit a man sworn never to defend his country, with its liberties, its women and its children! Even a barnyard hen will defend its young.

Where Speech Is Freest

COMPARATIVELY few Americans know that opportunity for the freest of all free speech in this free land prevails in the halls of Congress. Section 6 of Article I of the Constitution of the United States says, in part, 'For any Speech or Debate in either House, they (Senators and Representatives) shall not be questioned in any other place.'

Whether a Senator may challenge the statements of a Representative and demand proof, or a Representative require that a Senator substantiate his utterences, is not entirely clear, but it is very evident that no outsider has any defense against or redress for any deliberate, accidental or incidental misrepresentation, however libelous or damaging it may be.

This being the case, it is remarkable that greater advantage has not been taken of the immunity. It certainly must often have been a trying temptation and it would appear that in the exercise of this immunity for 138 years, throughout the deliberations of 69 Congresses, Congressmen have belied a popular estimate of themselves—that of being inordinate and unconscionable windbags. They do well enough in this line, to be sure, but with the bars down and the full right and power to go as far as they please without fear of outside accountability, it is a wonder they have not more generously availed themselves of their unique privilege.

Hedged about with so great a degree of protection, members of trade associations, professional societies and, it is to be feared, some religious organizations, would scarcely hesitate.

And yet it cannot be said that this provision of the Constitution is unknown to or ignored by certain members of our national legislature who seem to take advantage of their immunity to give the widest publicity to allegations and charges which, if made by anyone not a Senator or a Representative, or even by one of them in any other place than 'either House,' would call for the most searching investigation in which they would be required to produce the evidence upon which their allegations were based and to be personally liable for any injustice done.

It is well to bear this fact in mind in appraising the credibility of some of the startling revelations of our lawmakers which result in nothing but brief publicity in the newspapers.

Don Adolfo Diaz

AN INTERESTING person is Don Adolfo Diaz, president of Nicaragua as recognized by the United States Government. Not so many years ago he was secretary of a mining company owned in Pittsburgh and operating in Nicaragua, a company which paid Don Adolfo the sum of $1,500 a year so it could comply with the Nicaraguan laws decreeing that at least one official should be a native of that country. Then there came a revolution and Diaz emerged as vice-president—with the report that an American envoy had insisted upon his designation for that office. In the turn of affairs Diaz became president; but his régime was weak and within a year a revolution was started against him. Three thousand American Marines were landed to 'protect American lives and property.' Eleven of them were killed; but Don Adolfo was seated securely as president. Most of the Marines then went home, but a company of them stayed on, still protecting American lives and property, and four presidents all held office legally and peacefully.

In 1925, however, vigorous protests in Congress forced the recall of the Marines. A revolution and counter-revolution followed. Then, a few months ago, Don Adolfo Diaz bobbed up once more as president, with American recognition promptly granted him. And, strange as it may seem, American Marines once more were landed, 'to protect American lives and property.'

While Uncle Sam Sleeps

THE only idle nitrate plant in the world is in the United States.

There are now at Niagara Falls twenty or more electrochemical companies with invested capital in their operations of nearly $75,000,000. These plants produce electrochemical products in dozens of varieties and with an estimated annual sales value of some $60,000,000. The War taught us that the products of these plants are indispensable to our country's national defense. About 600,000 horsepower is in service on the American side at Niagara Falls, and of this total approximately 350,000 horsepower is used in the electrochemical industries, and of the total in electrochemical service about 160,000 horsepower is imported from Canada. We not only import Canadian power to operate electrochemical industries in the United States but Canada is taking the industry away from us.

The aluminum industry, it is understood, will now be expanded on the Saguenay River in Canada where nearly 1,000,000 horsepower is to be used in producing aluminum and its products. We cannot conscript these electrochemical industries when war comes. We cannot call these industries into service in time of war like troops.

The President and Congress must decide whether these electrochemical industries to serve national defense and agriculture shall be established on the Tennessee River or whether the Power Combine shall defeat their establishment.

The only idle nitrate plant in the world is in the United States.

On Your Mind, or in It?

GALSWORTHY has a line in *The Silver Spoon* which describes a statesman in office as having much on his mind but practically nothing in it. This description will arrest the attention of busy people everywhere, for the excess of busy-ness is one of the curses of modern life. The average busy mind is not a power-house or creative force, but a relay station through which things merely pass.

Originating nothing and retaining little, the bulk of our mental activity resembles nothing more than brick-passing.

Men of large affairs frequently reflect on this tendency in business life. Rarely do the administrative and creative minds come together in the same individual, because the administrative tends to deprive the creative of its nourishment. Suffocation in the incidental is the surest way to miss the fundamental.

The man who confronts the possibility of having a great deal *on* his mind can make no better preparation for it than by having a great deal *in* his mind. The possession of a durable foundation of lasting things keeps the mind from being jarred to pieces by the incessant traffic of passing things. As long as the mind must serve in some degree as a traffic highway, it should be well ballasted.

There is private as well as public mischief in the condition which Galsworthy so aptly describes. The private mischief is that men come presently to think of busy-ness as work. It may be mere motion, fuss, fever. It is no less wearing than work, perhaps it is more so, but it is not productive. The energy expended is not paid for in results. Women who run about to clubs and other social affairs, which are camouflaged under pretense of study or reform or service, find themselves with so much *on* their minds that they fret under the growing complexity of life; they begin to feel that they have been drawn into the circle of the world's important affairs; a sense of strain and haste occurs; but at the end of the season they can look back at nothing but a blur of busy, useless weariness. Men become enmeshed in the same net. The obvious cure for this unhappy state of affairs is a rigorous separation of the merely busy from the really needful and fruitful. It would reduce the count of dominating trivialities.

The public mischief is obvious. Men who have only much *on* and little *in* their minds inevitably become the agents of those who have something in their minds. The great danger of the statesman is not in moral weakness but intellectual insufficiency; a 'policy' of some sort is a necessity; if he cannot provide one for himself, he must take one ready-made.

And there are always plenty of interests hanging about, many of them honest interests but none the less dangerous, ready to supply him with a program or a policy. Statesmen who carry the heavy routine burden of office, confess their inability to give their minds to anything; they must largely depend on the judgment of others; the weighty work of legislation is often determined by men never selected for it: and the reason is that men in office have so many things on their mind that they have practically nothing in their mind.

Yet, when the public has a choice between a 'peppy,' feverish, run-around-in-a-circle man with heaps of things *on* his mind, and a calm, quiet, self-possessed, thoughtful, judicial man with much *in* his mind, it selects the 'peppy' man. That does not spell doom, of course, for after his selection the 'peppy' man is needful for someone to use him by supplying him with the intellectual material which he can use. And that is the thoughtful man's opportunity.

'Those early artists were realists, reproducing the familiar life in which they lived.'

How Primitive *Was* Prehistoric Man?

The Artist

By A. E. JENKS

Illustrated by GEORGE HARPER

Copyright, by A. E. JENKS, 1927

FOLLOWING the decline of the Neanderthal race of men, two races of the new species, *homo sapiens*, came into Europe. The Grimaldi, a Negroid race, came from Africa. At about the same time, the Cro-Magnon, whose distinguishable descendants still survive in the population of France, especially in the Dordogne, came in from the east. Each added new ideas and technique, and together they gave great impetus to culture during three cultural periods.

The first of these periods, called Aurignacian, is named from a small, ancient but still inhabited French village called Aurignac. It is the only village I have visited in France which did not lure me on to extended exploration. But Aurignac that day was too dirty, too smelly, and had too many active fleas to hold one beyond the hours of duty. The type-site of Aurignacian culture is within two miles of the village. It is a very small grotto, about the size of a household bathroom. I saw in the Toulouse museum every artifact taken from that site which fixed its name on the marvelous new culture period.

There were fourteen small sharp flint points, perhaps dart points, perfected beyond Neanderthal skill; three polished bone implements—more or less lozenge-shaped, about like long human fingers; and three bone points from one-half to two inches long with cleft base for fitting astride the end of a shaft or handle. Those twenty specimens complete the list of material from the type-site, but all were culturally new. They were an innovation in Europe, a step far in advance of the Mousterian culture of the Neanderthal race.

The Aurignacian culture, as revealed by the vast finds from Predmost in Moravia, used bones for other purposes also. Ribs of mammoths were perforated with large openings into which other ax-shaped bones were set at right angles. Thus bone axes were mounted on bone handles. Ribs were also shaped quite like the wooden ladles our grandmothers employed in such household labors as stirring cornmeal mush while it sputtered in open kettles.

The Aurignacian man introduced into Europe two other culture complexes: that of personal ornamentation and that of engraving, sculpture and painting. He had the esthetic sense as no earlier European possessed it. The Aurignacian dwelling sites have furnished small shells with punched holes; also teeth of the horse, wolf, lynx and elk with holes similarly punched, all worn as personal adornment and probably hung around the neck. Drilled circular holes in ornaments had not as yet been made in Western Europe. However, if Predmost culture proves to be Aurignacian rather than the later Solutrian, it brings abundant materials in bone and ivory showing a very much more advanced technique.

Bone bodkins or needles without eyelets (excepting from Predmost) are also found. They were probably used for sewing skins, so clothing was in use. At one Aurignacian site is a stratum of bones of the wild horse varying from one and one-half to six feet in thickness

nd containing the bones of about one undred thousand horses. Horse steak n the west of Europe and mammoth teak in the east of Europe, rather than eefsteak, were the chief meat foods of urignacian hunters. It should be oted that the Aurignacian man, by is sculpture of small figurines of omen, proves that during his life here was a widespread existence over outhern Europe of the Negroid people nown as the Grimaldi race.

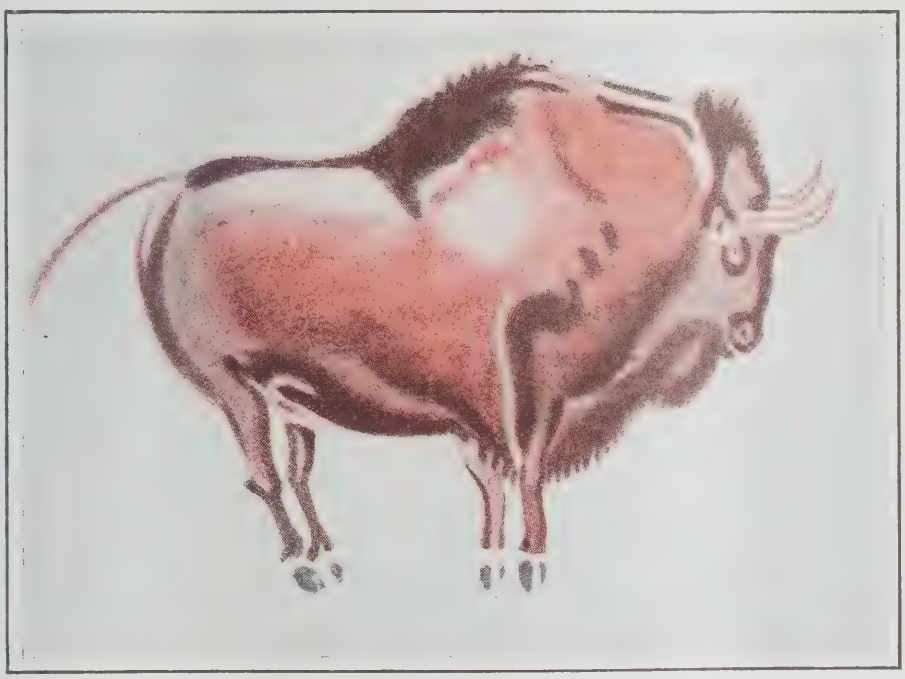
Though geographically Aurignacian ulture was almost coextensive with s predecessor, the Mousterian, yet here is no evidence that it was an volution from it. It was, rather, omething new. Excepting Czecho-lovakia, whose marvelous Predmost ulture-site, if solely Aurignacian, will nake necessary a new alignment of the elative importance of Aurignacian ulture, it was best represented in Belgium, France, Germany, Spain, and taly. England, Austria, Poland, Rus-ia, and Hungary came next. It was lso in Africa and in Asia. It probably rgely originated in Africa.

THE Solutrian culture followed the urignacian as the Würm glacier was n its retreat. The culture stage takes s name from the commune of Solutre, ear Macon, north f Lyons, France. here in the sunny pen lands, south f the escarpment r rock of Solutre, he type-remains re spread over an rea now known o be at least two nd one-half acres n extent. The ulture stratum in laces attains a hickness of thirty-hree feet, and verlies Aurigna-ian culture—in act, it overlies hat thick layer of abitation refuse omposed largely f the bones of one undred thousand orses broken and ooked in Aurig-acian feasts. The eople are believed o have lived in wellings con-tructed of timbers and light wooden r earth covering.

The Solutrian culture made one reat innovation in technique. Until hat time all flint chipping had been by ercussion, by striking blows. The olutrian man introduced pressure-hipping.

After long chips had been struck ff the cores, as the Aurignacian nan had shown, those chips were thinned and worked down by the removal of tiny flakes as desired by the new process of pressing a hard, compact point of horn or ivory on the spot to be modified, and the tiny chip was actually pushed off. This enabled the Solutrian man to make the laurel-leaf blades, one of which has been found even 13.8 inches long. A cache of fourteen of those beautiful blades has been found in France, all set close together on edge, and for some reason never removed by the Solutrian owner.

SOLUTRIAN skill also developed what is called the willow-leaf point, equally beautifully chipped, but having a notch on the edge near the base, thus making a short neck by which the point or blade could better be inserted in a handle of wood. The best Solutrian chipped flint products are from Czecho-Slovakia. This culture-stage was not of long duration. It is now looked upon as probably a product in France, or in the Pyrenees, of the racial and cultural contact of the Grimaldi and the Cro-Magnon races, in which the Grimaldi cultural influence weakened while the Cro-Magnon increased and at last swamped the other. At any rate, it is clear that out of the Solutrian came the succeeding Magdalenian culture period in which the Eastern influence predominates over the African.



Bison with red horns. (After a primitive painting.)

The type-station of Magdalenian culture is back again near Les Eyzies, that so-called 'Prehistoric Capital of the World,' in the Dordogne of France. It is a great rock shelter now about to crumble away into the ever encroaching Vézère River. It is named from a monastery of the Middle Ages, 'La Madeleine,' whose picturesque ruins stand on the brink of the rock cliff underneath which is the old shelter of the type-site.

The chipping of flint, which reached so high a level in the pressure-flaking of the Solutrian period, fell away woefully in the Magdalenian. This fact causes some students to think that Magdalenian culture was by an entirely new race of people. That aspect of the problem will need to rest until more skeletal material is at hand, on which, of course, the decision will rest secure. However, the art of working bone, horn and ivory was further advanced. And new types of implements came in. Bone needles, which appeared in the Aurignacian, were rare in the Solutrian, but became abundant in the widespread Magdalenian. They were slender and had excellently drilled eyelets. Evidently clothing was made and worn whenever needed.

BONE buttons with a single circular drilled hole for knotted-cord attachments are Magdalenian also. A wonderful harpoon was also developed in the Magdalenian culture stage. The harpoon, or rather harpoon-head, was first of bone, having sawtooth edges with points directed slightly backward. The head was attached to a wooden shaft and may or may not have had an attached cord which the hunter retained in his hand when the harpoon was hurled.

As the Magdalenian stage developed, the harpoon-head was made of stronger reindeer horn. The low-pointed barbs became a row of sharp recurved teeth along one edge, and finally along both edges. Eventually also a large hole was made in the shank of the harpoon-head which could have been for no other purpose than the attachment of a stout cord. Such harpoons were in use by the Eskimo, the barbed head being only slightly attached to the handle by which it was hurled. After being hurled into its victim, the head pulled away from the handle, but was attached to it by a connecting cord. Though the Eskimo employed his harpoons for taking such sea game as seals and walrus, the Cro-Magnon hunter of the Magdalenian culture used his for taking reindeer, *(Continued on page 24)*

Some Snapshots of China

By WILLIAM E. BARTON

A FRIEND from America who has long been resident in China thus spoke to me:

'I have lived in China for twenty-five years and have traveled widely in this interesting land, but I do not know it well enough to write anything about it. You have been here a week, and I presume you will write a book.'

I told him I was already at work upon it, and while it might not grow to a book, I certainly intended to write. I asked him to give me a sentence with which to start my book, in case, after a residence of seven or twice seven days, I should see fit to make my volume rather a large one. He gave me this sentence:

'There is no truthful statement that can possibly be made about China which cannot with equal truthfulness be contradicted.'

I think I know what he meant. China is too vast for easy generalization. Its four hundred millions of people are too diversified in geographical distribution, too unlike in language and habits of life, for anyone to write about one town or city and assume that all China is like what he has seen.

Dr. James M. Buckley, of the New York *Christian Advocate*, once told me of meeting a Russian who said:

'I can always tell an American, because he puts mustard in his coffee.'

It was useless to tell him that Dr. Buckley was an American and that he had never taken mustard in his coffee nor seen another American do it. This Russian had seen an American, or a man he thought to be an American, who put mustard, or what the Russian thought was mustard, in his coffee, and the Russian thereafter accepted no man as an American who did not do the same. Some judgments of China, made by men who have seen it as extensively as I, are of like character.

First of all, let it be confessed that China appears to disadvantage after seeing Japan. I put the case squarely to a man who is giving his life to work in China, and who knows both countries. I said, for he asked me to be frank with him:

'None of us who have come to Japan on this cruise, and from there to China, are likely to have been biased in advance in favor of Japan. We have all been told again and again that the banks in Japan employ Chinese clerks because the Japanese cannot trust one another; and when we presented our letters of credit at the banks we looked in vain for the Chinamen.

'We saw Japan resolute, confident and cheerful. And we found the people possessed of apparent unity of spirit and unbounded confidence in the future of Japan.

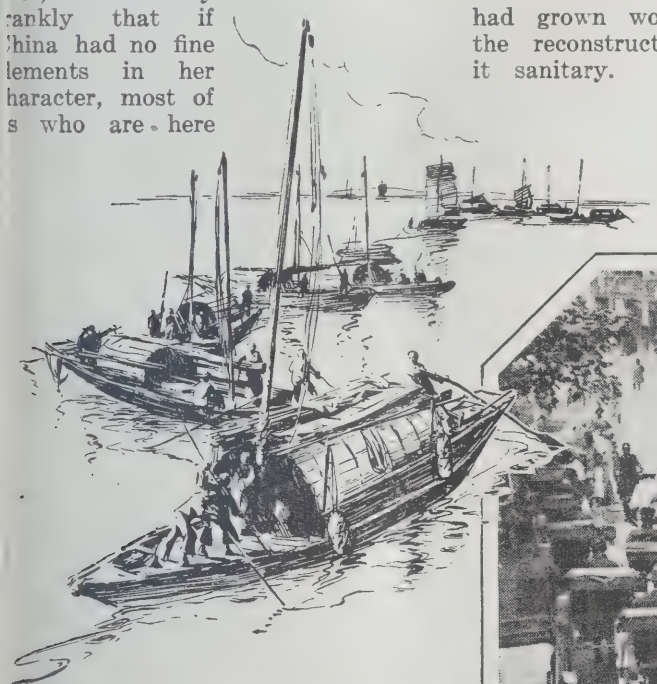
'I saw only two beggars in Japan, and I am not sure that I saw more than one. It was a Japanese mother professing to be a widow. She had a baby on her back. I think I saw two, for I met them two or three blocks apart, but it was on the same street, the princi-

al shopping street of Yokohama, nd the women of the ship's company ho shopped there say that there was ut one. But China is full of beggars. n Japan the ricksha man expects a ip in addition to his fare, but waits till he end of the day. In China the rickha man begs at the first and every successive stop.

OUR first visitors in China are wellers on the sampan boats, who ome alongside begging for the garage from the ship's kitchen. (And I ight add that these were the last to id us farewell.) Even those tourists ho entered Japan with prejudice have een unable to maintain an unfavorable npression of that interesting country. he Japanese have courage, pride, agerness to learn, and a sense of ational unity. These are great assets. Vhat has the Chinese character to qual them?'

He said:

'You have stated a strong case, and think a truthful one. The Japanese ave all these fine qualities. China oes not put her best foot foremost. Ve have here no such agency as the ery efficient and altogether admirable apan Tourist Bureau. We have no ay of telling China that she must sit retty when there is company. Moreover, let me say rankly that if hina had no fine lements in her haracter, most of s who are here



ould feel that still we who are strong ught to bear the infirmities of the eak.

'But the case is not so bad as it ight seem. Chinese character, whatver it lacks, has in it an element of tability, or genuine worth, which akes it worth while to work here. hose of us who have been here longest re those who are most fully convinced hat the Chinese have in them that hich more than justifies us in staying. Even their backwardness, their conservatism as compared with the Japanese, is in one way an asset. The Chinese stand without hitching. I make no comparisons. But the Chinese are worth working for.'

Another man said: 'The Chinese are undemonstrative. They are not what might be called a grateful people. I cannot pretend that we receive all the appreciation which I sometimes think we deserve. They are callous to suffering, and not very ready to appreciate effort expended in their behalf. For that matter, what people are appreciative?'

CHINA is vast. We ought not to think of the three cities of Peking, Shanghai and Hongkong as if they were New York, Philadelphia and Baltimore, but as if they were Montreal, Washington and Mexico City. The fact that nominally these three Chinese cities belong to one nation counts for little.

Shanghai is not China. Her suburbs might almost as well be in Kalamazoo or Kansas City. Hongkong is not China. It is a transplanted section of England, with an admixture of everything on earth. Canton is China. And yet Canton is rebuilding with rapidity as a modern city.

I was told that health conditions had grown worse in Canton since the reconstruction work to make it sanitary. Its streets are four to seven feet wide and roofed over. There is no rain in them and no dust. There is every smell on earth. You jostle porters who carry silks and salt fish, fine linen and night filth, babies and corpses. But as fast as old buildings are torn down and streets are widened, the air gets in and the wind blows the dust in every direction. The leveling of the old wall to make a bund eighty feet wide was said to have been a direct invitation to tuberculosis. For the winds whirl the dust along it and into the alleys, and that dust has in it a thousand years of accumulated germs. However, there is no turning back. The remedy is more fresh air, not less.

I said that Canton was still a Chinese city. But the Chinese are not city dwellers. They are a village people. City life is not what they profess. Those who have lived for generations in a city still give their address as the place where their ancestors lived. The colleges have to keep two lists of addresses of their students. A student gives his address, and is asked, 'Is that where you live?' He answers, 'No; that is the home of my family, and hence my home; but for the past four hundred years my people have lived in Canton, or Peking.'

AS soon as one gets ashore in Shanghai or Hongkong he meets tall, turbaned, black-whiskered policemen. They are Sikhs. They are said to make good policemen; the Chinese are afraid of them, and with apparent reason. But the Chinese are a people who do not kick against the pricks. For the most part they are docile and easily handled. Crimes of violence are not frequent among them. Neither do they commit robbery (*Continued on page 20*)

Sir Marcus's introduction to Charlie Black was a very magnificent affair.

Synopsis of Preceding Installment

Marcus Pendyce is the 'garrulous diplomatist' in question. He is an unmitigated bore, owing to his habit of unloading his reminiscences on all occasions. The members of the Lambs Club, who are the particular victims of Pendyce's anecdotage, determine to get rid of him, and a scheme is hatched by which he will go on a three months' lecturing tour.

MR. CHARLES BLACK was a remarkable man of enterprise, who started in a haberdasher's, had been most things from a stoker to a dancing instructor, and was now safely landed in quite a successful business as a lecture agent. It is well known that in the United States of America there is a passion for lecturers on every conceivable subject, and very often on no subject at all. Here, in the less intellectual British Isles, lecturers are less in demand, and it is generally considered that a lecturer is sufficiently rewarded by being allowed to speak for an hour or so in a hall or drawing-room on the subject nearest his heart without the addition of financial profit.

Mr. Black was changing all that. He had now a leash of excited lecturers at his heels, who went yapping and barking about the country, and he had roused quite enough interest in many of the larger provincial towns to make a small profit possible for his lecturers and quite a large one for himself. He was an honest, agreeable, faithless haberdasher, who considered his lecturers exactly as he had in an earlier period of his career considered collars and handkerchiefs.

'This is a very good little thing that we're doing,' he would announce to Newcastle or Liverpool, 'in *The Haunted Homes of England* style, or we have a line in *The Poets of Scotland* we can thoroughly recommend. These *Princesses I Have Known* articles are wearing very well indeed, and these *Denizens of the Deep* are meeting a long-felt demand.'

Some of his lecturers, I understood, objected to the atmosphere with which he surrounded them. He was quite frank with these superior persons.

'If you don't like it, modam,' he said, 'you can jolly well lump it. Here am I creating a new style of business, and you will kindly allow me to do it my own way. Good afternoon, modam. I expect your *'Igh Life in the Cities of Europe* will be most successful without my aid. No one will be more glad than I shall be if it is so.'

As he explained to me, he sounded a sarcastic fellow; he was not nearly so sarcastic as he sounded.

He was very glad to see me again.

'Why, Mr. Johnson,' he said, 'this is a sight for sore eyes! Are you thinking of lecturing yourself?'

'Do you think I'd be any good at it?' I asked him.

'Well, you never can tell,' he assured me. 'We 'ad a woman in 'ere last week who looked as if she wouldn't say boo to a goose, she was that frightened. She told me she'd got a series on the cathedrals of England, and I was going to turn her off, but suddenly the man I'd got going down to Brighton fell through, and I sent her down instead. Lord luv a duck, but she 'ad them paralyzed! The Royal Pavilion, too, where the old Prince Regent used to carry on any'ow. She made them cathedrals as thrilling as a circus. She 'ad them laughing all over the place. The best lecture they'd ever 'ad, they said.'

'Well, I've got a lecturer for you,' I said, 'who's the very thing. He's a retired diplomat, who's known everybody in his time and been everywhere.'

'Why, that sounds good,' said Mr. Black. 'Has he done any lecturing?'

'Not in public,' I said. 'Plenty in private.'

'Is he shy or nervous?' said Mr. Black.

NOT a bit,' I answered. 'Nothing can stop him once he's off. He can give you anecdotes about all the crowned heads of Europe; he's a most amusing fellow.'

'Why, that's the very thing I want,' said Mr. Black. 'It's a funny thing, but in these democratic days, the more democratic people get, the more they want to 'ear about 'igh life. Mention a duchess to 'em ten years ago and they wouldn't look at it. Give 'em a countess today, and they'll eat you. What's 'e look like?'

'He looks a proper old aristocrat,' I answered. 'Three chins, an eyeglass, and what's called a "portly presence." He's also got the Oxford manner. He's genial, friendly, and loves a yarn.'

' 'E's the very man,' said Mr. Black, in an awe-struck whisper. 'Send him along.'

Next day I lunched with Sir Marcus at the Lambs. There is something strange and uncomfortable, not alto-

gether unconnected, I suppose, with a ad sort of snobbishness, about being ntertained in a club by a man who is mmensely unpopular there. If there s some fine and righteous reason for his npopularity, then the guest may feel ll the virtuous happiness of supporting, gainst odds, a magnificent cause. But f his unpopularity has no greater basis han intrinsic unagreeableness, it is ifficult indeed not oneself to feel ungreeable and justly uncomfortable. It elped me a little to realize that Sir Marcus was completely unaware of the eneral attitude to him. In the few inutes before luncheon he approached ve different members of the club with n eager smile and an explanatory nger, and all those five men faded way from before him and were not. t was as though he realized that it as an essential condition of his state f life that he should only catch his ompany after many fruitless throws f the line and hook, and he turned his, in some wonderful way, to a deep ompliment to himself, on the ground, suppose, that the best of God's reatures are only appreciated by the w, and that nothing that is good omes easily.

WE were halfway through luncheon hen I made my proposal.

'Lecture?' he cried, sniffing the ir like a horse out for its first morning m. 'Lecture, lecture, lecture? Well, ow, why not?'

'Why not, indeed?' I said. 'I onder that you haven't thought of it efore.'

'My dear young friend,' he said npressively, aning toward e, 'I have ought of it on veral occasions. o tell you the uth, advances ave been made me, but they dn't seem to e quite worth , nor, indeed, to ll you a little ore, quite remunerative ough. Who ants me to lecre?'

I told him out Mr. Black, r. Black's enusiasm, and r. Black's marlous powers of ganization.

'He sounds a orthy fellow,' said Sir arcus, in his best diplmatic manner, 'but, of urse, you know, it's a klish business, my lecring. Discretion needed and tact. I remember in '64, when I was attaché in Berlin, a feller in the Embassy giving a lecture, and he made just the smallest allusion to the wife of young Bonny Cooper, who was First Secretary just then. Said she had the prettiest feet in Europe, or something, and, by Jove, there was a row! There was to be a ball the next night, I remember, and old Blenkinsop Smith—you know his sister probably, Mrs. Crawshay Fitzgerald; she's dead now, poor thing, died of eating too much, if you ask me; she was a wonderful woman for her meals—"I'll have some more of that," she used to cry, and would go on hours after everybody else, quite regardless—'

I called the worthy gentleman back to the business in hand. 'I am sure we can trust your discretion, Sir Marcus,' I said. 'The thing to do is to tell them just enough, you know, and not too much.'

Sir Marcus roared at this. 'That's the thing!' he cried. 'I don't suppose,' he said solemnly, looking toward me, 'that there is anyone in Europe at this moment who knows as much as I do about what goes on behind the scenes. Why, the war alone——'

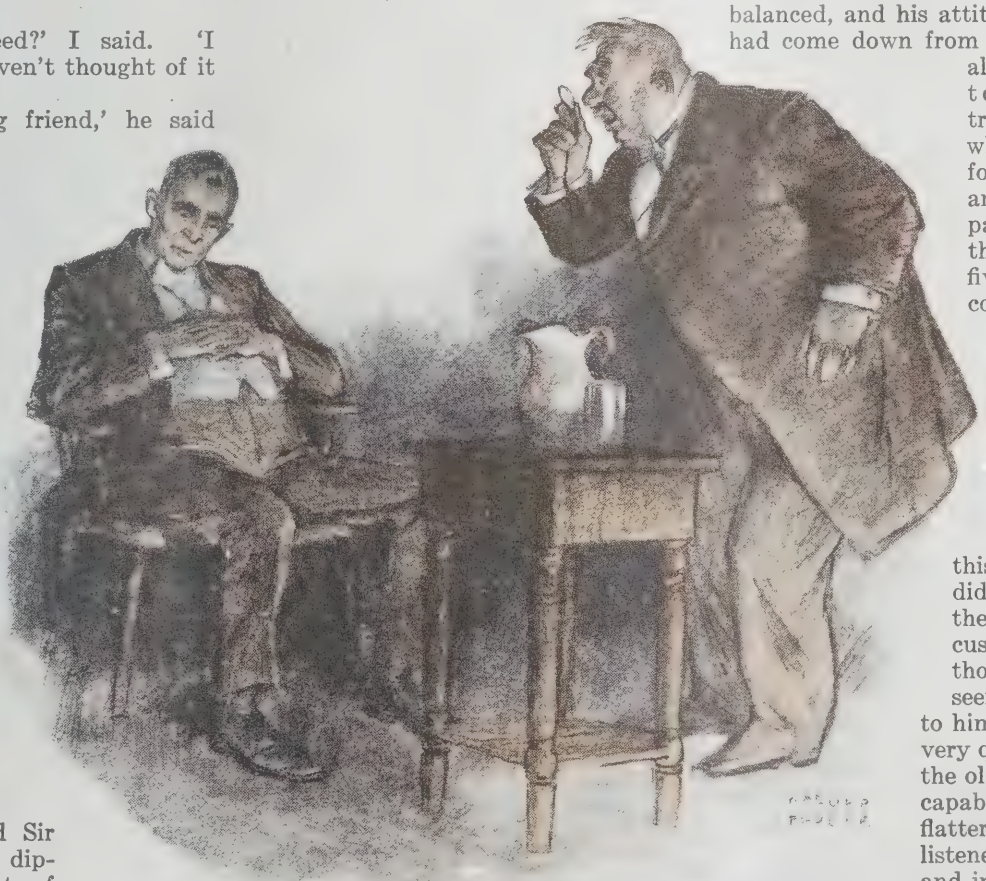
'No,' I interrupted firmly, 'there must be nothing about the war. It is your earlier experiences, Sir Marcus, that will be so interesting to everybody.'

He was, I could see, excited like a child by the idea. I didn't know then, but discovered later, that his finances were in a very bad way, and perhaps he felt more lonely and isolated than I had given him credit for. This was what he wanted—unlimited opportunity for speech, audiences impressed and enthusiastic, and money at the end of it.

Mr. Charles Black

His introduction to Charlie Black was a very magnificent affair. It had about it that curious theatrical unreality that so often occurs in real life. Sir Marcus was unreal, I saw now for the first time, because he was so desperately a survival. His kind had been killed by the war, and if they ever came up again, it would be with some new tradition, some fresh exterior, some more modern phrase. He was very magnificent to Charlie Black, treating him with a condescension and patronage that was wonderful to behold. He was magnificently dressed in a high black stock and pearl pin, and his eyeglass superbly balanced, and his attitude was that he had come down from the Olympus of all the aristocracy to greet some trembling mortal who had begged for his presence and was ready to pay large sums for the enjoyment of five minutes of his company.

For Charlie Black I had always had respect, but my admiration of him was immensely increased by his attitude on this occasion. He did not resent in the least Sir Marcus's patronage, although it must have seemed very absurd to him. He found out very quickly just what the old gentleman was capable of doing, he flattered his snobbery, listened to his stories, and interrupted them, when they were too lengthy, with wonderful dexterity.



A loud most unmistakable snore from behind caused Sir Marcus to turn around. Sir Muttlebury Hatt was fast asleep.

Finally the arrangement was made. Sir Marcus was to attempt a tour of three months, his lecture being entitled *The Great World as I Knew It.* The plan was that Sir Marcus should talk to young Smithers, Charlie Black's most able assistant, for several mornings, pouring out to him all the treasures of his experience, and that from these Smithers should make a collective narrative which the lecturer should read. Sir Marcus rebelled a little against this, telling anybody who would listen to him that he would infinitely prefer that he should talk straight from the heart.

'Spontaneity is my greatest gift,' said Sir Marcus, 'a gift denied to many. I am my natural self when I am unfettered by notes or pieces of paper. I do beg you, Mr. Black, that you will allow me to talk freely, easily, as though the audience consisted of a few friends of mine gathered together round the club fire.'

'Later on, later on,' said Mr. Black. 'You'll forgive me for saying so, Sir Marcus, but however natural an orator may be, and I know from your diplomatic experience that you must 'ave 'ad many occasions for public speaking——'

'Indeed I have,' interrupted Sir Marcus eagerly. 'Once in Berlin——'

'Quite so, quite so,' said Charlie Black gently. 'All the same, these are my terms, Sir Marcus. Take them or leave them.'

IT AMAZED and even touched me to see what a child the man instantly became in the hands of someone who knew how to deal with him. He was pitiably anxious about his success. The whole world stopped while he considered every detail of his approaching appearance. He bored me so desperately in the weeks that followed that on several occasions I nearly abandoned the whole affair. He was perhaps a finer artist on the telephone than anyone I've ever known. He would ring you up on most inconvenient occasions, when you were in your bath or at breakfast, or engaged upon a serious piece of work. It was of no avail whatever to say that you were out, or ill, or busy. Against such an excuse he had the simple retort of ringing up steadily every successive few minutes until you were found to be in.

Then, once he had you, words came tumbling through the air like flakes of a snowstorm, and if you said goodby or put down the receiver too quickly, he would be at you again in another five minutes with the remark that he hadn't quite finished what he was saying, and somebody must have cut us off.

The real cure, however, was already working. During a whole week he only once entered the club, and Pom almost fell upon my neck and embraced me in the middle of Piccadilly, and was anxious to pay me my money there and then. 'No, you wait,' I said. 'He may be back on you in another week or two. Nobody knows how this lecture tour will develop.'

At the hotel, sitting on his bed in his pajamas, Sir Marcus burst into tears and clung to me as though I were his wife, mother, grandfather rolled into one.

Never, never, never shall I forget that first lecture. It took place in a hall in the wilds of Wimbledon. It had been well billed beforehand. There were posters up and down the streets of Wimbledon, announcing that Sir Marcus Pendyce, C.B., M.V.O., would give a lecture on 'The Great World as I Have Known It,' that nobody now alive had had quite the experiences that Sir Marcus had had, that he was a noted raconteur, and that although efforts had been made for many years to force him on to the lecture platform, it was only now that, bowing at last to the insistent public demand, he had consented to appear. The hall was packed, the walls were lined with standing people, the gallery almost shed perspiration upon the heads below it, so hot and pressed and excited was it. The chairman of the evening was Sir Muttlebury Hatt, J. P. for the district, a gentleman so curiously like Sir Marcus on a smaller and more insignificant scale that I once again admired Charlie Black's resource in that he had secured a chairman who should, as it were, prepare the way for the speaker by being just half as grand, half as large, half as impressive. Then Sir Marcus appeared. There was a storm of cheers. The two gentlemen sat on the platform smiling a little nervously, nodding to one another and looking at their watches. The chairman was not a man intended by the Deity for public speaking, and after he had muttered a few remarks about being amongst friends, everybody knowing everybody, and the great world, and how nice it was to see everybody, and how certain he was that everybody was going to be very happy, he sat down.

Sir Marcus rose, and for a passing moment I felt for him all the tenderness and pity that a mother may feel for her only son dispatched for the first time into the brutal world of school life. For once the poor man was terribly nervous, lost, bewildered, and confused. He took out his eyeglass, wiped it, put it back again. He smiled, laughed a little, and then suddenly remembered his paper, which he picked up, held upside down, and then began to murmur to himself. Then suddenly, I suppose, the blood of the Pendyces came to his rescue. He made a sudden plunge, caught and held that fine booming voice that was so familiar to all his friends, and was off. I must confess that he read very well indeed, with the only exception that he laughed a little too much before he arrived at one of the jokes that came swimming up toward him from the bottom of the page. In fact, on one occasion he broke off parenthetically to remark: 'Now, this is a good one,—you all listen to this.' But otherwise he went steadily forward to the end. Then, to my horror, I saw him lay the paper down, take a step forward with his hands in his pockets, his head tilted back, begin to discourse on his own. 'You have had, my dear friends,' he said, 'what I think without exaggeration I may describe to you as a really interesting paper, but perhaps I flatter myself—' Here he paused and waited, and as there were no remarks from the audience, he continued. 'Nevertheless, there are some other things that occur to me as I stand before you that may, I think, amuse you. Let us consider ourselves all friends gathered together round the club fire.' A group of school girls from the Wimbledon High School in the second row, who had been growing a little sleepy, all sat up and began to look interested.

'I remember in Berlin, it must have been, I think, in the spring of '71 or the late autumn of '70, perhaps—'

My heart sank. I looked round me in

despair, but on this occasion it was our chairman who saved us. Sir Marcus was barely launched into his first international episode when a loud, most unmistakable snore from behind him caused him to stop, start, and turn round. Sir Muttlebury Hatt, his legs stretched in front of him, his arms crossing his stomach, was fast asleep. This disconcerted the speaker most surprisingly. There must have been many other occasions when his hearers had slept in his presence and he had continued undismayed, but this time he was beaten. He stopped, stammered, and finally broke off with: 'Well, dear friends, good night, good night, good night! I hope you've enjoyed the evening as much as I have. Perhaps one day you will allow me to come and see you again.'

There was a storm of applause. Sir Muttlebury Hatt awoke, got upon his feet, and said that Sir Marcus Pendyce had given us all a great deal to think about, that we had felt during his delightful speech as though we were all part of the great world ourselves, that we had learned, at any rate, that the great world was very little different from the small one, and so on and so on. The evening was over.

There began then one of the most curious episodes of my life. There was no reason whatever why I should accompany Sir Marcus on his tour, but there was something simple and childish about the poor gentleman that touched my sympathies. I would never have believed that a few weeks could so completely change a man of his age. It was not, of course, that he became in any way less of a bore. He was rather more of one, if possible, but the rough and tumble of that lecture showed him to be what at heart he must always have been—a nervous, frightened, rather pitiful child, flinching before the great world he was now discovering for the first time in his long life, finding it, indeed, so utterly different from anything that he had supposed. What a sheltered, safe, ordered existence those before-the-war diplomatists must have had! Will anyone ever be so safe again? I trow not. To Sir Marcus the risk of the lectures, the possibility that the audiences might be slender, the further possibility that they might not like what he said, and might tell him so, the discomfort and ugliness of the English provincial hotel, the jostling and jolting of incessant train journeys, the colds and indigestions and neuralgias and headaches that hang exultingly around the path of every lecturer—of all these things he had had before no slightest hint.

In the third week of our tour, when we arrived at Edinburgh, it was wet, cold, and windy, and that night of our arrival at the Caledonian Hotel, sitting on his bed in his pajamas, he burst into tears and then clung to me as though I were indeed his wife, mother, grandfather rolled into one. He could give me no coherent explanation of his breakdown—he had earache, the fish hadn't agreed with him at dinner, the last lecture in Carlisle had been but thinly attended, his little jokes about queens and kings, prime ministers and beautiful ladies, had seemed, even to himself, curiously out of date and dusty. In short, he was a poor, bewildered human being in a bewildering, foggy, dangerous world.

I suggested, although I knew that I was, perhaps, losing all my chances of success, that he should abandon the tour. Not for a moment! He sprang on to the floor, began to gesticulate, searched for his eyeglass, and proved to me unmistakably that the success of his enterprise was the only thing that he now considered. I saw, in fact, a disaster approaching us. The lectures had been less and less successful, and this always for the same reason—that he would not stick to his book, but would burst, at the most unlikely places, into incoherent anecdotage that had no beginning, no middle, and no end. At Liverpool, before a very thin audience indeed, he had talked for a solid two hours, and finally had to be dragged from the platform. This loquacious habit had immensely thrived on lecturing. It seemed, indeed, as though now it was physically impossible for him to stop talking. Even in his sleep, from my room, that was next to his, I could hear him continuing: 'I remember in '71—,' and so on.

There were twenty more lectures for him to deliver. We descended from Edinburgh to Durham, and there in the small concert room in the town hall, some twenty or thirty people were all his audience. I really could have put my arms around Sir Marcus and patted his white head when, in the little room behind the platform, the man in charge of the hall said: 'Mighty few here tonight. I should put 'em all in the first two rows and have 'em close together. Looks a bit warmer.' He made then, I saw, a truly magnificent struggle to pull himself together, threw back his head, adjusted his eyeglass and went forward, my warmest admiration bearing him full company. From the open door of the little room I could see the hall, with all its cruel exposure of empty seats, its glaziness, emptiness, and coldness, and once again—as I had felt on so many other of the cases connected with this business of mine—I wondered whether I were not too cruel to be really true. Then I noticed, sitting in the front row, two dear old, rosy-cheeked, white-haired ladies, and with them a nice-looking young man. Their eyes were fixed on Sir Marcus from the beginning of the lecture to the end. They gazed on him adoringly. The smile never left their faces, and although they did not seem to take his especial points with much more active appreciation than they took the whole of the discourse, they were quite plainly in ecstasies about the whole affair. It was quite delightful to see the way in which they nodded their old heads at one another, and one of them, at the end, actually waved her hand. I saw that Sir Marcus also had noticed them, and at the end of the lecture he went down on to the floor and spoke to them and the young man. He was with them a long time, and I waited and waited, and at last went off to the hotel, not wishing to interfere or cut short any happiness he might be securing.

Next morning, to my surprise, he told me that he intended to stay in Durham for a day or two, and that he would cut the lecture at Newcastle out of his schedule. He seemed in amazing spirits. I asked him who were his new friends. 'The Misses Piggott and a nephew. Two adorable old ladies.' He was going to lunch with them that day.

The lecture following the Newcastle one was near London, so I went down back to my old haunts, leaving Sir Marcus with his new friends.

Charlie Black, when I saw him the next day, told me quite frankly that our diplomatist was a complete failure, and that he must call off the other lectures. I begged and pleaded, but all to no avail. 'Just give him another chance,' I said. 'The whole happiness of his life depends upon it.'

Charlie Black was not to be moved. 'Silly old fool!' he said. 'I warned him not

Hermit's Company

Fannie Stearns Davis

I KEPT a mouse for company.
Each night as I sat idle he
Darkened his least hole by the stove,
And nibbled small cake-crumbs, and throve.

His eyes were black as glass. His paws
Had tiny sharp pink-patterned claws.
His tail was sleek and tapered thin.
He could hide faster than a sin.

His ears, if there stood light behind,
Were leafy lobes all veined and lined.
Satin and smooth his close grey coat;
Luxurious Quaker—tail to throat.

I held him dear for company.
He was so small . . . He left me free . .
He never grudged me silent space
To stretch my soul, and cool my face,
To think, and think, and never speak. . .
Death's self alone could make him squeak!

to get talking all that stuff on his own. If he'd stuck to what we wrote out for him, he would have been quite all right, but not 'e, conceited old puppet.' No, business was business, and Sir Marcus Pendyce's career as a lecturer was at an end.

I met Pom, and was about to confess to him that our plan had failed, and that the Lambs would see Sir Marcus once more in their company at a very early date. Luckily I refrained. Once more, as on so many other occasions, Fate had stepped in and saved me. I had a note next morning from Sir Marcus, headed 'Mulberry Cottage, Fetters Moor, Durham,' saying that he intended to stay for a week or two with the Misses Piggott, and he was enjoying himself very much, and that the rest of the lectures could go to Hades. I saw that my sympathy had been wasted, and I was glad that it was so.

Week after week passed. Sir Marcus did not return. Then it happened quite by chance that I met, at some dinner-party in London, a Canon of Durham Cathedral, who was having a week of theaters in the Metropolis and enjoying himself very much indeed. 'By the way,' I said, 'do you happen to have seen anything up there of an old feller Pendyce, who was once a diplomat?'

The Canon laughed. 'Why, yes,' he said. 'Old man with white hair and an eyeglass, never stops talking?'

'That's the man,' I said.

'Yes, of course; he's living out at Fetters Moor, five miles out of Durham, with two old ladies.'

'That's it,' I answered. 'Do you happen to know how long he's going to stay there?'

'Oh, he's there for the rest of his natural days! He's taken up his abode with them for ever. He's just what they've been searching for all their lives. They're dear old things, but they're the greatest snobs in Europe. They'd go miles just to see anybody with a title, and to have a real ambassador living with them gives them a happiness that is delightful to behold.'

'Yes, but,' I said, 'how can they endure it? He talks the whole time, and he's the greatest bore in Christendom.'

'That doesn't matter,' said the amiable Canon, laughing. 'Didn't you know? They're both stone deaf—'

I was paid my check by Pom on the following morning.

'Average' as the Goal of Education

(*Continued from page 2*)

ing can do is to awaken the mind of the pupil to reasoning and then give him some tools to reason with. Putnam is not getting those tools. And the second section of the report uncovers a fondness for the lock-step—which is inimical with thought.

'Now, take the second section—the habit report. This is ambitiously headed, "Habits and Attitudes Desirable for Good Citizenship." Who determined that? Let us take some of the specific headings:

' "Stands on two feet without leaning." I should like to know who determined that standing on one foot was incompatible with good citizenship. Has anyone made the rather laborious research to determine the relation between the full service of citizenship and the position of one's feet? If absolute conclusions have been arrived at, it seems to me this should be put on the agenda of the League of Nations, for then we could get at the troubles of the world through its feet. Personally, I never use two feet if one foot can be made to serve. I cannot think of any single class of people that constantly uses two feet, other than the army, and I do not know that the contributions of the army to the intelligence of the country have been significant. Of course, if a pupil took to standing on his head, that would be another matter.

' "Anticipates his needs and does not borrow." A much higher grade of intelligence would be indicated by a pupil anticipating his needs and borrowing.

DON QUIXOTE AND THE WINDMILLS. *Pen-and-ink impression by* GERALD VAN DER HEYDEN

' "Respects authority." The whole progress of our race has been based not on respecting authority as such but upon respecting authority according to the righteousness of its genesis. Respecting authority because it is authority is Teutonic.

' "Is attentive when someone else is talking." There is nothing to this. The real point is to discover what this someone else is talking about and then instantly to determine whether it is worth listening to.

'Most of these headings have nothing in particular to do with good citizenship or anything else. But if we should assume for the moment that all of the headings were right—or that any list could be drawn—and that an analysis of this sort was needed, then I cannot see how it is possible for any teacher accurately to make this elaborate diagnosis even for one pupil, let alone for a class.

'I have never been able to agree with flippant characterization, such as may be found, for instance, in reference blanks sent out by employment agencies. It is not possible to dissect the intricate intellectual elements which go to make up the mind of a human being and then quickly mark them as positive or negative. It is done, and it is done with great self-sufficiency, but to be able to do it is not an indication of keen observation. It is an indication that the observer is not really an observer at all but has a mind filled with slogans instead of a mind filled with thoughts.'

If you are delegating the education of your children—and in part you must—to what sort of notions are you exposing them? It might pay to find out.

No—I did not get a reply. I withdrew the boy from the school.

Snapshots of China

(*Continued from page 15*)

in any ordinary conditions. Chinese servants steal clothing and food but ordinarily not money. But Chinese soldiers, mostly recruited from the streets of the cities, easily become bandits. The river bandits are so by heredity. They are alleged to be the descendants of pirates.

In Hongkong are said to be 200,000 river people, who are born, live and die on their little boats. The river is packed with them in places. Some of these people are pirates. Until the establishment of the republic they were not permitted to marry land-folk. The matter of piracy on the river between Hongkong and Canton is a present-day matter. Only a few months ago a steam launch belonging to Canton Christian College, loaded with students, was captured and held for ransom. The ransom was not paid. The governor of the island of Honan, on which the college is located, assured the college people that it was not wise to pay ransom, or it would have to be done again. 'They will not kill,' he said. 'When I was a robber, we captured for ransom but we did not kill.' This was encouraging information, and it proved reliable. The girls were released at once, and the boys came back in detachments. Before many days the boat also was recovered. The words, 'When I was a robber,' were no figure of speech. This governor, Lei Fuk Lam, is a great friend of Canton Christian College. Dr. Cadbury, of the college faculty, has done good service for him in the matter of bullet wounds, and so on.

While thousands of these boats are in the river, not one of them is permitted to land at Shahmeen, the foreign part of Canton where the American, British and other consulates are. That is an island. No Chinaman is permitted there at night unless he is a servant in some American or European house. On the two bridges leading across from the city proper, every Chinaman who leaves with a bundle that is not obviously suitable for him to be carrying, or who does not have a pass for his package, is stopped and searched.

Chinese and Japanese eat much sea-food, not only fish but sea-moss, and the physicians on board our ship comment on the absence of goiter among these nationalities. What they eat besides this, I do not know. I have had one or two meals in high-grade Chinese places, and I am satisfied not to know what I ate. One thing, however, should be stated. Chop Suey, however spelled, famous as it is in Chinese restaurants in America, is unknown in China. I hope I have not eaten much of some of the things I have seen carried home to eat by Chinamen. The food is not so bad if you do not ask too many questions.

Chinese appear to eat all the time at public entertainments. When they have nothing else to eat, and between the courses, they eat watermelon seeds just to keep busy. In a Chinese restaurant, when you have entered and have been served with tea, you are brought hot towels, one for each person. They are wet and saponified and perfumed. Between the courses, also, a hot towel is now and then furnished each person at the table. I think I had five at one meal. It is a custom which has much to commend it.

The Punishment of Sisyphus

(*Continued from page 5*)

marry say Mary or Helen would be that I would be fearful that the next day someone else would appear more desirable. Theoretically, I should like to be married, so as not to miss anything. For example, I want to be doing or living the exact right thing at the exact right time in relation to everything else. Paraphrasing Goethe, I try to live perfectly in a perfect world, and neither is true, I know. Should I try to practise the piano with a definite idea of learning Chopin, or to exercise at the gymnasium that I might develop my muscles, the situation mocks me hideously. The practising I did three years ago was effective while it lasted, and I was sure I was accomplishing something then, but now it is as if I had not done it, and if I practise now, how much or how little should I play? One hour a day, two, three . . . Paderewski practises eight. But then that would interfere with other things and why should I arbitrarily choose eight? I have no real reason. But the decision to practise eight hours fits in exactly with Paderewski's scheme. He is doing the right thing.

I ONCE tried to apply the golden "mean" of Aristotle: moderation. But what is the deciding factor? Should I do calisthenics for one, two, three or fours hour a day? Should I row in the rowing machine at the gym one, two, three or four miles? Why only one hour, why swim only a short time in the tank when men and women are now swimming the Channel, down the Hudson? I know that one gets one's second wind and that the body is capable of much. Would I not have a new outlook at the end of such an intense exercise?

'But I have not the conviction, nor persistency, nor concentration to hold to any such course.

'Every moment with me is fraught with a thousand possibilities which change with my change of place; for example, from bedroom to sitting room; from house to street; whether the sun is out or under; if the day is rainy or cloudy, I actually rejoice, for then I feel that I am missing nothing in the country.

'I am jealous of mountains lying in the sun to be climbed, of every sunrise and sunset missed. But being present at such would not ease my despair. I would wish for X or Y as a companion, or that, if I had done so and so, or joined such or such an organization in the past, I would now be climbing this mountain with perhaps a crowd from my theatrical show in town, or fellow-students, or with a company of my regiment.

'The futility of all these regrets I feel would not be present if I had my normal health and passion and progressed naturally from one phase to another. Once in a great while, after violent exercise, or peculiar diet (semi-fasting and vegetable eating), or when somewhat intoxicated from wine or such, my mood is different and confidence returns. Thus I feel that if I could discover some *deus ex machina* in the form of a principle (say) of breathing deeply, or eating very slowly, or running three miles every day, or taking a hot and cold shower every morning, I could permanently lift myself out of this condition.

'Consequently, I search the bookstores for some such outside aid, hoping that some day the secret may be miraculously solved.

'I am not afraid to work if I know what I am doing. I would start walking from New York to San Francisco instantly if I knew that at the end lay a complete change in my condition.

'I have the feeling that I have not yet begun to live, that I will some time strike my stride, but all the time the best years are slipping away.

'I realize that I am completely selfish and that anything I do for others is done that I may have greater freedom and time for enjoying my own affairs. Intellectually, I know how I should feel toward others, and I act the way I know I should only because I hope that some time my feelings will rally to support these acts and carry on to the future. When I am in a friendly crowd or a social gathering, I have not the slightest confidence.

'At a dinner party I am dumb from self-consciousness. I do not feel secure. If someone struck me in the street, I would probably be physically afraid and then be paralyzed to know what sort of action to take, to ridicule, to enact a dramatic scene, to convict the man, or what not. My instincts seem unnatural: what I construct

VENICE. *Pen-and-ink impression by* GERALD VAN DER HEYDEN

is from bare intellect—nothing urges me into, "the only possible path."

'A sort of complete lack of interest takes hold of me; a sort of mental and physical paralysis, an actual great physical and mental *tiredness* which is more pronounced at some times than at others, and at some times of the day more than at others. I am far from comfortable physically; muscles feel weak and ache dully, whole body feels heavy and I apparently have a chronic bad taste in my mouth and an indifferent digestion. I am subject to colds; my eyes burn and become inflamed from reading and my head feels quite like ivory or bone. How people in general can carry on, I am at a loss to understand: lawyers, clergymen, actors and actresses from whom flow natural and vital actions which for me to do would have to be studied, each one, and deliberately planned.

The one time when I can remember that for a few moments I felt full of vitality and in tune with the world was ten years ago, upon awaking from an anesthetic in a hospital; then the green grass from the window, the air, every possible human activity seemed infinitely attractive—my senses were unblunted and keyed up to life. The mood lasted perhaps an hour. I would willingly forfeit ten years of life to have it for a year.

'Do you think I shall be given opportunity to make the forfeit?

'I have turned to everything that I can think of or that has been suggested to get out of the quicksand of a useless, unhappy life. I have gone in for systematic exercise and physical training; I have tried change of scene and diet. I have embraced Christian Science and tried the Yogi plan.

'I have turned to uplift work in boys clubs and settlements; I have consulted psychologist and hypnotist; I have been treated by persuasionist and psychoanalyst; I have put up with the taunts of my relatives that I am a "nut," and of my acquaintances that I am a fool, but naught has availed, for here I am today, the battledoor and shuttlecock of relentless fate; a misspent youth fading; an impotent maturity developing; unborn tomorrow, dead yesterday, and today not even sweet.'

The young man who penned these lines is the descendant of distinguished ancestors, 'old families' whose names are associated with the towns of New England, the sections and streets of one of our great cities, and its culture. He is the last male of his father's name, and he bears the supreme imprint of incompetency, inability to experience the throes of love.

THROUGH his ancestry on both sides, more vivid on the paternal side, runs a scarlet thread of degeneracy which conditions the psychopathic constitution. His father was an epileptic, and his mother a timid, unwise woman. She sapped the childish independence and deflected his inclination to wander, to discover, to explore. She knotted his wings with her apron strings when he was old enough to fly; she bought up all the jackknives of the village when he was old enough to whittle, and when he had the measles she had tanbark put upon the street. Thanks to her he never knew a responsibility or had to make a decision. She did her best to make a ladylike person out of him and she succeeded. When she thumped the clay, it murmured 'Gently, mother, gently, pray.' But she thumped it all the harder!

His profound incompetency is in the field of the emotions. He has a weak affectivity without adequate motive power, the psychologists would say. Motives are weak, strivings pusillanimous. All his impulses, reproductive, nutritive, social, ethical, are feeble. Long ago he was seduced by a form of thinking dear to children: thinking away from reality. The 'sight' on the aim of his psychic apparatus was removed by his mother and not replaced by his teachers.

He is a constitutional psychopath now beyond the reach of priest, physician or pedagogue.

One Thinks of Burns *First as a* Poet, *Then as a* Plowman; *But Here He Is Something* Different

Called by Burns' sister 'an extremely good representation' of her brother.

ROBERT BURNS, *The* Exciseman

THE world knows far less of Burns the exciseman than it does of Burns the poet, and if it thinks of him in any other rôle than that of an inspired writer, it is in that of a humble plowman whose struggle with an unkind soil was far from successful. But in his later years Burns held the position of an officer of the excise. His principal duties were in connection with the enforcement of the liquor laws in the Dumfries district, particularly the prevention of smuggling.

If Burns were still alive, and were to carry out his original intention of seeking his fortune on this side of the Atlantic, it would be hard to imagine him taking a very enthusiastic part in the prevention of rum-running, for as an official it must be confessed that he was too soft-hearted to carry out the stern duties of his post according to the strict letter of the law.

The belief was long held that, on account of some indiscreet speeches, such as his proposing, at a dinner-party, the toast to Washington as preferable to one to Pitt, Burns' chances of promotion in the excise, if they were not absolutely destroyed, were so affected that his supposed neglect preyed upon his mind, and in various ways hastened his end. But Burns' political opinions had little or no affect on his career as a government officer.

A register was kept of all censures issued by the Board of Excise. This register is still in existence, and the absence of Burns' name proves that he was never censured by the commissioners, not even in the mildest form in which they were in the habit of conveying their displeasure, namely, for what they characterized as 'trivial faults.'

During the time Burns was in the service, all the excise duties imposed by Pitt at the close of the American War of Independence were in full force; and it will convey some idea of how multifarious were the duties of an excise officer in those days, when it is stated that the instructions formed a volume which in outward appearance was not unlike a large family Bible, and extended to nine hundred and thirty-nine pages.

IN THE register kept by the excise authorities the names of all the officers in Scotland were alphabetically arranged, with a brief statement of the conduct of each on the margin. For instance, it was recorded of one man that 'he was a good officer, but now tipples'; of another, that he was a 'trifling officer—drinks'; whilst a third was pilloried as a 'drunken creature.' To these may be added a 'lazy supervisor, much given to the bottle,' and a 'middling officer; likes a glass.' It will thus be seen that the department kept a sharp eye on the conduct of its men.

In a list of this description, made up some time after Burns joined the service, the marginal entry opposite his name is: 'Never tryed a poet'; with a subsequent interlineation: 'Turns out well.' While giving satisfaction to his superiors, the attitude of Burns toward those whom in the discharge of his official duties he found guilty of violations of the liquor laws, may be summed up in the words of one of his biographers, Dr. Robert Chambers:

'Inspired with a just view of the contraband trade as an infraction and disturbance of the rights of the fair trader, he was disposed to be severe with the regular smuggler; but in petty matters of inaccuracy, or even something worse, among the country brewsters and retailers, he tempered justice with mercy.' One has only to read his works to see how much he was guided in all his doings by the spirit of charity.

There was still living, in the year 1874, an old lady, Mrs. Bennett, Moniaive, Dumfriesshire, who remembered Burns when he was discharging his duties as exciseman, and was able to throw considerable light on the manner in which the tender-hearted 'singer of sweet songs' conducted himself in this capacity. Mrs. Bennett—Maggie she was then called—was the daughter of a blacksmith of the name of Kirk, who lived in the village of Carronbridge, and whose connivance in sundry dealings in smuggled liquor caused him to be occasionally visited by the poet-gauger. Maggie Kirk was at this time about ten or eleven years of age, and was in a position to form a pretty accurate idea of how Burns did his work as an emissary of the government, as the following story will show:

One day a man belonging to the district left a quantity of smuggled brandy in a stone jar, or 'graybeard,' at the blacksmith's house. It was concealed in a press, or corner cupboard, which was securely locked. Soon afterward, Kirk and his wife had to go to a sheepshearing held at a neighboring farm. The blacksmith, fearing a raid from the government officers in his absence, handed the key of the press to his daughter, with orders not to open it to the 'gaugers' should a surprise visit take place.

It so happened that in the course of the day, when Maggie was alone in the house, the supervisor of the district made his appearance, accompanied by Burns. The supervisor had evidently got scent of the smuggled brandy, for he plied the little girl with questions on the subject. He was particularly desirous to see the inside of the press, but although the dutiful Margaret was quite willing to describe at least part of the contents to him, she did not feel herself in a position to gratify his curiosity further.

FULLY to understand the situation, it must be borne in mind that in those days the landing of a cargo of French brandy or Holland gin on the coast of Scotland was no uncommon occurrence, as may be gathered by those who read the exploits of Dirk Hatteraick in Scott's *Guy Mannering*, and the simple folk of the countryside considered that the cheating of King George out of what they looked upon as an unjust imposition was nothing to be ashamed of.

The smugglers were known as 'free traders,' and free trade in all things was then—and still is—a principle strongly held by the Scottish people. They thought it illogical and unjust that the government should grow rich at their expense; for what had the government ever done for them? Even the gaugers, be it said—not for any paltry bribe, but on the same principle of fair play in dealing with imported commodities—were not inclined to deal harshly with any householder who sought to replenish his 'graybeard,' or to fill his tea canister, with goods that had never paid duty, and which, when procured through the legitimate channels, were luxuries that only the rich could afford. Little Maggie therefore 'thocht nae shame' to impose the weapon of mental reservation against the fire of cross-examination with which she was assailed by the supervisor.

The Tam O'Shanter Tavern.

In the meanwhile Robin stood behind his superior officer and endeavored by various facial signals to reassure the trembling wee lassie; for he was loath to see trouble brought upon the home of his friend the blacksmith. Burns doubtless guessed what the cupboard contained, and was well aware that a heavy penalty would result if liquor were found. Possibly the supervisor had also a shrewd idea of the real state of matters, but hesitated to resort to extremes; otherwise it would be hard to account for the circumstance that he did not find means to open the cupboard and thus satisfy himself. Be this as it may, the poet was, according to the blacksmith's daughter, much concerned as to the outcome of the inquisition, and as to what might happen should the press be opened. 'At one time,' declared Mrs. Bennett, 'he winked hard at me owre the supervisor's shoulder to be sure no to let on.'

Finally the officers took their departure without a climax being reached, but on a later occasion, when Burns was leaving the house after an official visit, Margaret heard him say to her father: 'Well, well, smith, so long as you take care of yourself and take care of the bairns, I will never hurt you.' The poet whose tender-heartedness is shown in his exquisite lines to a mountain daisy, and to a field mouse, was not the man to put in force 'the utmost rigor of the law' in the case of the humble folk of his own class who, apart from their slight transgressions against the revenue, led good and wholesome lives.

How Burns would act in a similar capacity at the present day it is hard to say; for the liquor traffic in Scotland is quite a different thing to what it was in his time. Smuggling has entirely disappeared, there is no illicit distilling, and the activities of the inland revenue officers are almost wholly confined to the distilleries and bonded warehouses where liquor is stored in large quantities. How Burns himself regarded his official calling is not altogether clear, but it is almost certain that he was not particularly proud of it, and accepted the post of excise officer only through dire necessity. His farming ventures had been failures, and the returns from his literary work being too precarious to insure a living, he was glad to secure this humble post under the government through the kind offices of influential friends.

His delightfully satirical poem—'The Deil's awa' wi' the exciseman'—may be taken as some indication of his thoughts regarding the attitude of the people toward such an unwelcome functionary:

We'll mak our maut, and we'll brew our drink,
We'll laugh, sing, and rejoice, man,
And mony braw thanks to the meikle black deil,
That danc'd awa' wi' th' exciseman.

The acceptance by Burns of the post of exciseman was therefore not a matter of choice, but of expediency. His idea was that it would prove a stand-by in his struggles to provide for himself and his family, and would ultimately, through promotion, bring him a competency and leisure sufficient to pursue his real life work.

At the time of his death he was slated for a supervisorship, and it has been commonly asserted that this post would have made him happy; but this is a mistake. He was acting as supervisor when his last and fatal illness seized him, and in a letter to Mr. Heron of Heron, in 1795, he says, referring to the duties of this position: 'The business is an incessant drudgery, and would be nearly a complete bar to every species of literary pursuit.'

He looked forward to the supervisorship only as a step to the still higher post of collector. Alas! this hope was never fulfilled. If it had been; if Burns had been relieved from that uncongenial drudgery of which he complained, many years might have been added to that life which was ended before it had reached its prime. Had he been given a collectorship, as Scott was made sheriff of Selkirkshire, much more might have been added to the literary treasures which he left behind. On the other hand, had he never had anything to do with such a department as that of the excise, it might have been better for him, for he was a man whose temperament was ill fitted for such employment.

It may seem strange at this time of day to speak of 'links with Burns,' but although Mrs. Bennett, the heroine of the incident in the Carronbridge blacksmith's house, died half a century ago, there are some persons still living who have met and conversed with other friends of the poet. A few years ago the writer had an interesting chat with an aged business man, living in retirement, who came from the 'Burns country,' and who when a youth had been acquainted with an old lady in the town of Kilmarnock who as a child had attended a dancing assembly at which Burns was present. Such was the fascination exercised by the plowman bard, that his presence at such gatherings was sufficient to attract every bonnie lassie in the district for miles around.

The magic of his personality survives with undiminished power, and the undying fame of Burns the poet never obscures, but rather accentuates, the intensely human attributes of Burns the man.

Criticisms of the character of Burns are chiefly based on his alleged fondness for lasses and glasses. Whatever truth there may be in the former, he made a faithful husband to his 'bonnie Jean,' and as to his tippling propensities, the answer is already given.

—*From Pictures and Portraits of the Life and Land of Burns, 1840.*

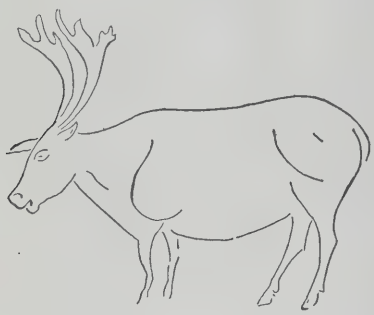
The birthplace of Burns.

How Primitive Was Prehistoric Man?

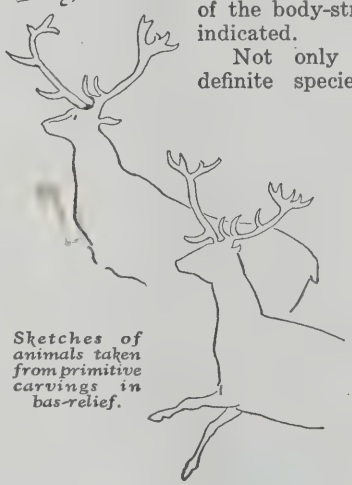
(*Continued from page 13*)

horses and other land game. As the wounded animal plunged forward. the dangling harpoon handle would impede its progress, aggravate the wound and cause excessive bleeding as it caught now and again in the forest growth.

Besides these new implements, the Magdalenian man had a dart- or harpoon-thrower made of bone. The end of the shaft or handle of the harpoon was fitted into a notch in the thrower, and thus was hurled as with an arm of nearly twice the length of a man's unaided arm. Also there was a so-called 'baton,' also made of bone, whose exact use is not determined. It always has a large circular hold near the angle of the implement, and may have been a badge of authority, or a shaft straightener,



or have had other unknown usage. But it was common and widespread in lands of Magdalenian culture.



Sketches of animals taken from primitive carvings in bas-relief.

Magdalenian culture stretched all the way eastward across Europe from Spain to Irkutsk in Asiatic Russia. It has even been reported still farther eastward in Siberia. It reached an almost unbelievable elevation in the field of engraving, sculpture, clay molding, and polychrome paintings of animal figures. Those artistic productions were mostly on the rock walls of grottoes, and were of animals contemporaneous with the artists, most of which are now extinct.

I am painfully aware of the inadequate conception I can here create of the art of prehistoric man—of his line drawings, paintings, relief carvings, sculpture in bas-relief and in the round, and of his clay modeling.

No claim is made that the artists of Aurignacian, Solutrian and Magdalenian culture were master-draftsmen, or that they had perfected smooth surfaces or clays as vehicles of their art, or possessed the physicist's knowledge of mixing paints, or the best tempered tools for cutting rock or bone or ivory. But when one sees the hundreds of animal figures they left he knows that among those artists were draftsmen of rare skill and great fidelity.

The man who painted the bison figures on the ceiling of the grotto at Alta Mira, Spain, was an artist genius. That unknown man, working on a rough rock ceiling in a dark grotto lighted by burning fagots and with grease paint made of fat, charcoal, red and yellow ochre, painted half a dozen bison quite as well as Rosa Bonheur painted horses in her 'Horse Fair.' No other known paleolithic painting art equals that at Alta Mira.

Those early artists were realists, reproducing the familiar life in which they lived. Since they were a hunter-folk, their world of action, thought and feeling was the world of their animal companions. If a great artist were to be produced among them, his creations would of necessity be animal creations; and so they were.

Figures were feebly scratched or more boldly engraved on bone, horn, ivory, small pieces of stone, and on the walls and ceilings of rock shelters and grottoes. Carvings of figurines in bas-relief and in the round were made with bone, horn, ivory and stone as the vehicles. Figures were drawn on rock walls and ceilings with charcoal, and some were painted with ochre in such detail that not only is the modeling of muscles shown, but even the direction of the body-streams of the hairy coat are indicated.

Not only are fish reproduced, but definite species are faithfully depicted. Mackerel swim in schools; salmon swim upstream in 'Indian file,' and with lashing tails leap to higher levels of water. Horses feed, walk, trot, canter, stand blown as at the end of a hard run, and, in death from arrows or darts, stand with sprawled legs, hanging heads and drooping ears. Reindeer are depicted, male, female and young, singly and in groups, feeding, walking, calling, and licking their companions with the tongue. Bison are shown doing the things you have seen domestic cattle in the pastures do. In Alta Mira there are half a dozen perfect ones. They are two-thirds life size. Some stand, others lie as cattle do, with feet curled beside their bellies; some have the neck bent and the head resting in sleep upon the forelegs.

There are impish and cavorting goats which make one laugh. There are boars charging fiercely with open mouths. Cattle look sedate, as safe in a farmer's pastures, or, nose and ears forward, inquire of the wind 'what's up?' Fat bears wallow along with nose down, sniffing for sweet honey or sour ants. Wolves with hung heads look wolfish and not foxy. There are foxes who seem to know as much as foxes are said to know. A lion sits up; she has just left off slicking her fur. There is a rhinoceros the French call *joli*. There are elephants and woolly mammoths, trumpeting, fighting,

or standing quietly as though dozing.

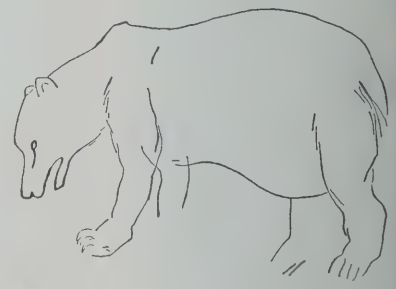
There are many other species of animals, living many phases of life, and each one in its characteristic way. The chamois is timid or precipitately fleeing. The standing ass looks it. The swan stretches her doubly curved neck in feeding.

Most of the reproductions represent animals in straight profile. But there are a few shown in front views. Also a few in profile present the animal with neck bent and face looking backward. Food animals—as horses, cattle, bison, reindeer and mammoth—are sometimes depicted as fatally wounded with darts or arrows. There are two small figurines of reindeer shown slain and tied as for carrying home from the kill.

One naturally asks why all this animal art? Why did prehistoric man make art reproductions of animals? The most common answer is that he did it as a part of his worship and practice of magic in connection with killing the animals for food. That reason is probably important, but I think it is not the chief reason. Only a small percentage of the animal reproductions suggest hunting or killing. I know of only the two which suggest that the slain animal, or meat, was to be taken home.

It was earlier noted that those artists were realists who portrayed their many animal companions in their daily doings. We know clearly there were artists in those days who could draw and paint and carve and sculpture. I assume that the creative faculty existed then as now. Some persons made songs, others concocted riddles—but for all we know, those creations have perished. But some were creators whose work has survived, and those we today are calling the artists.

Was it not always true, as is said today, that 'a picture is its own reason and justification?' To the creative artist there is the satisfaction of an undertaking finished.



And there is more satisfaction when an undertaking is better done than when it is poorly done.

What is the reason for art, what the stimulation for art coming from the spectator? Perhaps the chief reason a picture which pleases us does please us is that it appeals to our memories.

Another reason for prehistoric art, as for present-day art, is that it appeals to the beholder's imagination.

A Chat With Don Pio Baroja

(*Continued from page 3*)

approval and were told they could not be passed as there was no stable for the mule that was to operate the machinery!

'But,' said Don Pio, 'there is no stable because there is no mule. Ours is an electric bakery.'

'That is not the point,' returned the town council. 'The regulations are "one stable for the mule," and a stable you must build.'

This convinced Don Pio that the life of the small manufacturer was even more tiresome than that of the writer. Those years in the bakery brought him into touch with men and women of all kinds, and took him particularly among those living on the outskirts of society. Most important of all, he consolidated that passion for the common people, the popular types, artisans and beggars, hangers-on, and down-and-outs, which accounts for his admiration of Dickens and Dostoevsky.

DON PIO needed no goading into conversation that morning. He was in a good humor. He had caustic things to say about everything. His first metaphor came, as it were, straight from the oven. Said he:

'I am a vagabond, a man without method, going from idea to idea. The stylists and the formula seekers come to me and say, "How is the novel going?" "Don't know," I tell them. And when I have finished it they come again. "What is it like?" Ridiculous! Farcical! "*Ca*," I say, "Don't know." "What?" they cry, "you mean to say you don't know what your novel is like?" "Naturally not," I reply. "It is like making a cake. You put flour and eggs and butter into it and you might even throw some cheese in it if you are a fool, and you mix them all up; but you don't know what it is like till it's cooked and tasted. It is an adventure." "But who can know if you don't?" they persist. "You had better become a baker," I tell them.'

In twenty-five years or more he has written some thirty books, mostly novels. He jots them down anyhow and anywhere, so he said. There is nothing like them in any other language. Nothing else resembles their grim sardonic humor, their violent, indolent, nonchalant characters, scores of them that appear for a page or two and go away again never to reappear. It is like revealing for a moment a glimpse of the lives of passers-by in the street, who will never pass that way again. These books of his are restless, unquiet, blunt. 'In four strokes,' says Azorin, 'he can draw a character.'

Well might he be that young, idling guttersnipe in *La Busca* (*The Quest*, a story of Madrid slum life which has been translated into English) who wandered from street to street 'to see if anything was happening.' Or he might be the bird in *Paradox Rey* (*King Paradox*) that cried, 'I seem to be looking for something—but I'm not.' This vagabond literature is undoubtedly in the great tradition of *Don Quixote* and the original picaresque novels, in which most truly flow the discursive, errant and sporadic energy which is the essence of the Spanish spirit.

I led him onto this topic. He lowered his voice to confessional tones. He said:

'That is it. You know, I suppose a writer lives in his writings the ideal life he would like to have lived had circumstances been kinder. I could have asked for nothing better than to have been an aimless wanderer at odds with society, pushing on from place to place, impelled to vagabondage. How I could have *lived* in the intriguing chaotic Spain of 1835, with Aviraneta! He was an uncle of mine of whom I have written in my *Memoirs of a Man of Action*. He was a soldier of fortune who fought in Greece under Byron and was in every war worth fighting in. Theoretically I should have liked this. In practice I should have loathed it. I should not have been able to stand it, physically. I am a placid, peace-loving person with a passion for travel but with no capacity for facing discomfort or exposure.'

Yet he is a man of action. He is a social portent. His is the grumpy protest of the natural man. His novels throw up the world in silhouette against a grotesque and garrulous background of people who do not fit in easily with the social order. Like all Spaniards he is an intense individualist.

'I have been called an anarchist, I, a baker!' he said. 'It is stupid. I am Pio Baroja.' And drily laughed.

'I get into very hot water with stylists,' he explained.

'Azorin—you saw him as you came up?'

So that was Azorin I had passed on the stairs. I remembered him. The chronicler of the 'generation of '98' and the most accomplished and delightful essayist Castile has produced. But a man in every respect the antithesis of Pio Baroja. He continued:

'Azorin says I write badly, that my grammar is appalling. But I am a natural man. I tell him it is natural for me to write the way I do. It is better for me to write naturally and badly than unnaturally and well. I am interested in life first, not in esthetics. I am interested in art only as it is the faithful mirror to life. For me'—out came the baker again—'for me a good, practical cookery book is without dispute more important than *Hamlet*, *Don Quixote* and *The Sorrows of Werther*.' He smiled wickedly and added, 'You may say this is not artistic. I don't care whether it is or not. That is not the point.'

HE enthused most about travel. We discussed the countries we had lived in. He talked about South America 'where happily the governments are so bad, being Spanish, that adventure is still possible, and even the geographical features are unknown.'

Yet with all this garrulous individualism he is a modest little man. One day he was asked to sign the visitor's book at some gallery or museum.

'This page, and put your titles and orders,' commanded the attendant. Indeed there were signed illustrious names, with titles and orders in all their pomp and fustian. Don Pio—I can see him with the little *boina* like a cold blue pancake on his head and that mild pale face, solemn but as mocking as the moon—took his pen and wrote:

'Pio Baroja—humble man and wanderer.'

The OLD AMERICAN DANCES

which are now in popular revival are contained in

'Good Morning'

An interesting book about the beautiful dances as taught in the

Ford School *of* Dancing *at* Dearborn

It includes calls, music and a great series of illustrations visualizing the various steps and, in addition, the origin, etiquette, style and deportment of the dances. There are important suggestions for arranging and conducting a successful dance.

Durably bound in paper covers, printed in clear type, 169 pages.

The price is 75 cents, but readers of THE DEARBORN INDEPENDENT may obtain a free copy in return for obtaining one new subscriber for this magazine.

From Battlegrounds *a* POPPY Grows

Jessie Jim, Indian Princess, *Links Up* Old Conditions *With the* New

By F. J. CLIFFORD

A YELLOW September sun. It floods the Spokane plains with golden splendor. Through the scattering pines and more open places jogs a wiry cayuse in that peculiar gait so characteristic of the Indian pony, more than a walk but less than a trot. It is learned through the constant urging of a quirted hand, especially at the end of weary journeys.

The rider is Ow-hi—wise counselor of the Yak-i-mas and adviser for Ka-mi-a-kin, great war chief of the Northwest Indian tribes.

A short stop for a drink below the falls of Spokane River where coming years see white men building a beautiful city, and the red man presses onward. He comes to bluffs above a little valley. He stops. Below in a spreading creek bottom are many tepees of white warriors.

Unswerving, straight into the enemy camp he rides. Soldiers look up questioningly. Stopping a moment he asks:

'Kah mika ti-ee—Wright?' (Where your commander—Wright?)

A dragoon points to the tent. The Indian stops in front of it. Colonel Wright appears.

'It is Ow-hi speaking', the red man says in Chinook jargon. 'I come asking for peace. Our hearts are sick of fighting. My son, Qual-chan, the young war chief, wishes to fight no more. It is for his life I am asking. You are bitter against him. You desire his life. If our blood must be shed—let it be mine. Qual-chan is young. He has many years left to serve his people. I am old. If I cannot die in battle then I am ready to die for my son and his people. I will say no more!'

The white commander writes an order. Soldiers gather about the old Indian. He is dragged from the horse and thrown to the ground.

'Do you know where Qual-chan is?' he is asked.

'Yes!' he answers defiantly.

'Tell him to come here!'

'I will not!'

'Then you will be hung and your son caught and hung also!'

Ow-hi is astonished, humiliated, to be so summarily dealt with. His bronzed face fades to ashen gray as he murmurs:

'Qual-chan hung—Qual-chan hung?'

And he stubbornly refuses to have his son come into what he considers a death trap.

Qual-chan, at his camp near the mouth of the Spokane River, is eating supper when he hears of his father's arrest. Hurrying through, he orders up his three swiftest horses. Accompanied by his brother, Lo-kout, and his wife, a beautiful Spokane Indian girl of fiery temperament, they set out for the Colonel Wright encampment.

A note is sent to an officer. A bugle sounds. Soldiers gather about Qual-chan, who has dismounted. From a bunch of pack-saddles comes his father's voice:

'My son—why did you come? Now we all must die!'

The soldiers start to lead Qual-chan away after disarming him. He resists. A terrific fight ensues, for the young Indian is tall and broad of shoulder and deep of chest, with arms like steel. Soldiers swarm about him like ants. Lo-kout, the brother, leaps into the mêlée. A blow on the head renders him unconscious. Qual-chan's young squaw swings a lance she carries, hacks her way out and flees to the hills.

Lo-kout revives to find himself bound hand and foot. He sees Qual-chan fighting his way to his father. But ere his corded hands can free the old man's bonds, a noose coils over his head. The young long-haired warrior is hauled back gasping and shouting:

'Wake memaloose nika—nika tillicoms hiu solleks—memaloose mika—memaloose mika!' (Don't kill me—my people will be awful mad—kill you—kill you!)

BUT many hands swing him into eternity from the limb of a tree—to fight no more.

'Jump on your horse and ride for your life,' a friendly Spokane Indian whispers in Lo-kout's ear. He feels his bonds severed. Springing to his brother's mount, a horse noted for its speed and endurance, he is away like a drifting shadow, bullets whistling about his ears and cutting the brown grass underfoot. Chagrined dragoons thunder after in mad pursuit. Lo-kout urges the speedy animal to its utmost. It leaves the shouting soldiers far in the rear and carries its rider to friendly hills and safety.

Proud old Ow-hi fares differently. With feet and hands tied he gets a bullet in the back when making a desperate attempt to

Oval—Tepees of the Indian Council held at Spokane.

escape—or does he invite quick death rather than a lingering one in a prison or at the end of the hated rope? Even then he sits reeling in the saddle until a dragoon rides up and ends his misery and troubles with a bullet through the gray head.

This same September sees the birth of a young chieftain, son of In-na-mo-sech-ee, over-chief of the She-lanes, Me-thows and Okanakanes. Thirty years more finds this infant grown to a stalwart chief whose name is Long Jim. His home is on gently sloping land near the mouth of beautiful Lake Chelan. Comes a day when the new Indian agent, Hal Cole, appears.

'Long Jim—,' he says, 'it is now time to take an allotment. Have you got one picked out?'

'No—,' replies the young chief, his swarthy features growing blacker, 'I will never take allotment!'

BUT you must take an allotment!' the white man insists, 'and give up your tribal holdings.'

'I wish to live here, to be free to come and go just as my fathers have done. I will not take allotment!'

'Very well—,' says the agent resignedly, 'I will have to take more drastic measures.' He summons soldiers. They place Long Jim under arrest and take him to Fort Spokane, two hundred miles away.

Days and weeks slip by. A month—two months pass. Long Jim is stubborn and will not give in. His head men come and plead for him to accept an allotment. He drives them away with black words and blacker looks.

At last chief Smitkin, Wa-pa-to John and Ty-ee Michell tell the agent that Long Jim will take an allotment. The prison doors swing open and the Chelan chief finds himself free after nine weeks of imprisonment.

A long ride and he is home again. All about, the land is being surveyed and set aside for Indians and white men. Long Jim is wrathful. His rage knows no bounds. From a bold, forceful leader he becomes a sullen, morose individual. He is angry with his followers though they did it with the best of intentions. His allotted piece of ground galls him. He who had control of the land as far as the eye could see—from the snow-capped Cascade Mountains to the rolling plains across the Columbia River—could now step from boundary to boundary in a few minutes' walk.

At last, in sheer desperation, he leaves the land of his fathers and journeys to the Okanogan Valley some forty miles away. It is still open country—an Indian reservation on which the white men have no rights. But the old camp ground he covets is occupied by a cousin, Columbia Jim. To get him to move away and leave him in solitary possession costs Long Jim $250.

FIVE boys are born to Long Jim. And five boys lie side by side in a graveyard a half mile to the eastward. Then a girl is born. She grows into splendid young womanhood—dark-eyed, finely proportioned, with a face showing character and refinement, and cheeks like poppies from Flander's fields.

She watches a car drive in through the gate. Not many cars come to their primitive holdings. The land all about is wild, much like it was when the Astor fur traders came there and planted the Stars and Stripes a hundred and fourteen years gone by. It is the Indian agent's car. Her father goes out to meet him.

'Long Jim,' the agent says, 'I have a special invitation for you and your daughter to attend a great council of Indians in Spokane this coming November. All your expenses will be paid. Will you care to go?'

Many days the old chief considers the invitation. Perhaps the old imprisonment still burns in his heart. But between the coaxing of the young girl and promise of old friends to take them there in a car and see the girl properly guarded, Long Jim consents to go.

This great intertribal council to which the chief and his daughter were invited was the first one ever held in America. It really grew out of a football match between the Gonzaga high school and the Haskell Indians of Lawrence, Kansas. Indian leaders declared their people would attend in large numbers. People got to talking about it. Somebody suggested making it an Indian celebration. Out of it grew the National Indian Congress.

It is a great day for Jessie Jim. A bit timid at first, she adjusts herself to city life with amazing rapidity. She does not win the princess crown, but her modest ways, the long, black, braided hair of her very own and genuine old-time buckskin dress make her a close contender and one not easily forgotten.

SPRINGTIME finds her and her mother behind the pinto ponies on their way to the Moses Lake country to dig *kamas*, ancient food of her people, a wild plant which grows much like a turnip. Returning home, she and her parents are invited to the second National Indian Congress, where she is proclaimed Princess America II. Regardless of the many honors showered upon her, she remains the same modest, unaffected Indian maid. After a week's rest she joyfully accompanies her mother and the pinto ponies to the Methow Mountains to gather and dry huckleberries against the coming winter.

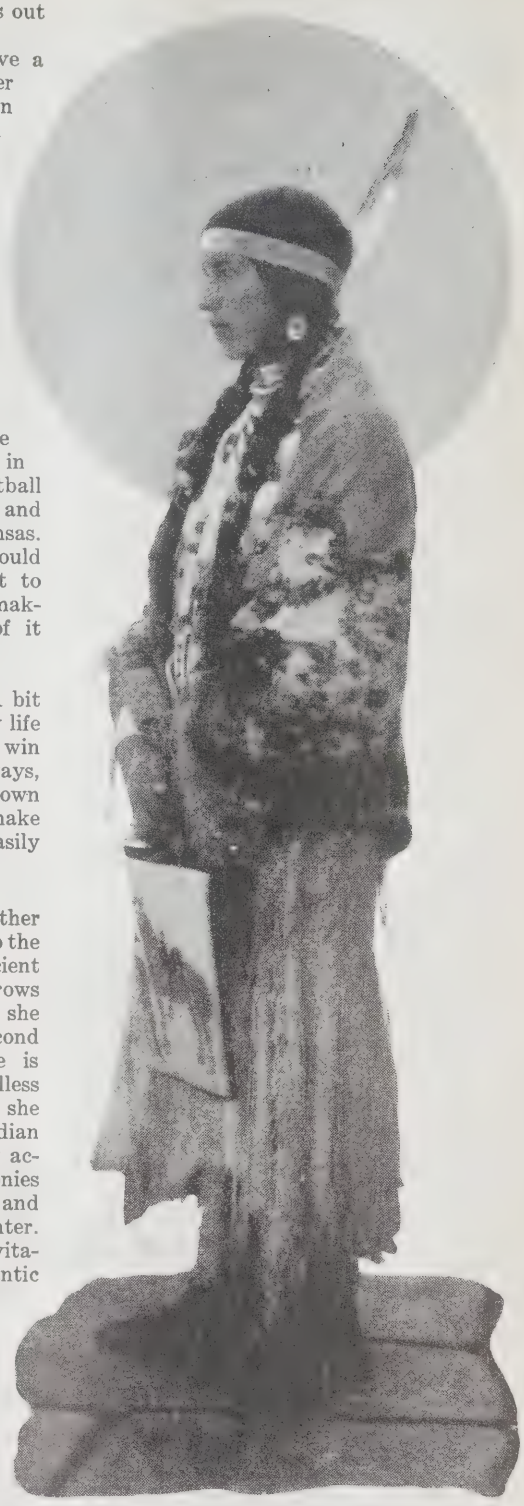
Returning home, she receives an invitation to be a guest of honor at the Atlantic City Pageant festivities in September. Officials assure her father that a chaperon of high ability and standing will accompany her all the way—that no harm could possibly befall the girl.

The aged red man weighs the words most carefully, his keen black eyes searching the faces of men who speak. He has listened to promises of white men before—sometimes to his sorrow. But the assurance of old, trusted friends help him decide to permit the girl to go.

A yellow September sun. It floods the wild country about the mouth of the Okanogan in golden splendor.

An Indian girl climbs into a light wagon beside her mother. A little to one side stands her father, Long Jim. He gives the girl one last intense look.

Not a word from the grim lips, not a falter in the bronze features, no faltering of the black eyes, as the wagon rattles away behind the pinto ponies, the start of the long, long journey. They disappear. The old chief turns away, for there is a limit, even to the iron will of an Indian. Tears course down his swarthy features, and they will course down every day until the girl's return—this quiet Indian girl.



'Princess Jim,' daughter of 'Long Jim.'

Long Jim's face lights up when he contemplates the honors awarded his only child—equally so does it darken when he thinks of the past—of the ancient glories of his race and the changes that have lost him his lands.

Jessie Jim, Princess America, guest of a nation, who, flower-like, springs from the battlefields, from the land where old Ow-hi, Ben Franklin of the Yak-i-mas, sleeps in his unknown and unmarked grave.

CHATS WITH OFFICE CALLERS

'Here,' said ***the Editor,*** as he glanced through his morning's mail, 'is a letter from a woman in Tulsa, Oklahoma, asking "what on earth children read half a century or so ago?"'

'Well, let's see,' pondered one of the office men who seems to have read everything. 'There were the Elsie books, *Swiss Family Robinson, Robinson Crusoe,* all of Dickens, *The Wide, Wide World, Queechy, St. Winifred's, Mansfield Park, Alice in Wonderland.* Getting into the wise age, they went in for *Ouida,* and Mrs. Hungerford, and Miss Braddon—*Molly Bawn, Red as a Rose Is She, Not Wisely But Too Well, Cometh Up as a Flower,* and that kind of thing. The boys had Jules Verne, and Henty, and Kingstone. The lovers of the sentimental had their Bulwer-Lytton and Lever and Mrs. Henry Wood. Those with a taste for the erotic or daring went to Zola and Gautier and other translations from the French. Juveniles had their Grimm, Andersen, Perrault and the *Arabian Nights.*

'So resources were not limited any more than they are today. And coming literary fashions are very apt to be much like those that went before. Volumes without the slightest claim upon any genuine intellectual interest will have their day, then die; and books with no higher claim than amusement will spring into momentary popularity, presently to wilt. Men and women will recur with delight to books written by men of literary taste and sound performance. New books will come, which appeal to those who seek a kind of sweetly cloying atmosphere. Faddists will offer new lamps for the old and tried. Some will write for a cheap, popular applause. New prentice hands will struggle for recognition. For there's little that's new under the sun; and as it was, so it is, and probably always will be. Some day some one will plot the curve of literary fashions, so that at any given time, by looking at the chart, it will be possible to say what is coming next: Romance—realism—the erotic—the sentimental—the gently emotional—the idyllic—the fantastic—the mystical romance—the historical romance—the idealistic. Then Da Capo with romance—realism, and so forth. There will be new Dr. Ibsens, and Herr Spenglers and Signor d'Annunzios to follow and pattern after. There will be critics painstaking and critics nimble-witted; critics who wait for bellwether guidance and critics who say what they think; critics waspish and critics sympathetic. But taking it by and large, when a Galileo gets into the book business it will be possible to predict what is ahead and coming, just as astronomers predict the advent of comets and groups of meteorites.'

* * *

'Some people of the North,' said ***the Southern Gentleman,*** 'have a grotesque conception of the South. They look upon it as a hot, blistering country, where people are lazy and backward and the fields cultivated by downtrodden blacks; and the conditions in the mountains even more backward.

'What about its popularity as shown by the northern restaurant that is proud to advertise its "southern cooking"? What about Florida? What about Texas? Few know that at the beginning of the 19th Century, before the invention of the cotton gin, the South enjoyed industrial supremacy over New England. It is argued by some that if slaves and cotton growing had not been introduced into the South, that section would today be better off. Cotton made agrarians of four-fifths of its population. And its industrial activities have only recently resumed marked progress.

'A fact or two will illustrate the revival of the South since the Civil War. True taxable property in southern states is assessed at 70 billion dollars, or one-fifth of the true value of the property of the entire country. The value of manufactures today shows a gain of 1,400 per cent over that of 1880. The value of mineral products has increased 18,000 per cent over the same period; agricultural products, 1,100 per cent. We have a great landed area, 945,000 square miles in fact. The scenic features of the South are well able to hold their own.'

* * *

The Man from Texas told of an interesting discovery recently made of Republic of Texas notes, dated 1837, signed by Sam Houston, the president, and bearing interest at the rate of ten per cent.

'The question arises,' said our visitor, 'who is going to pay the notes and how much are they worth? That is the matter that is interesting New Orleans bankers, Secretary Mellon, and W. Gregory Hatcher, state treasurer of Texas.

'The notes totaling $1,040 were found in the Canal Bank, New Orleans, in a strong box which had not been opened since 1838. The Louisiana legislature, by an act passed last year, ordered all the banks to provide the public administrator with a list of all boxes unopened and unclaimed for ten years or more, and ownership unknown. The opening of these boxes is bringing to light many queer and forgotten things!

'How is the matter likely to be settled?

'Secretary Mellon says that the matter must be taken up with the state of Texas, for the United States Congress on September 9, 1850, voted $10,000,000 United States five per cent stock to the state of Texas on account of the public debt of Texas outstanding when the state was admitted to the Union.

'The Texas state treasurer says that there are no funds on deposit with his department for the payment of either interest or principal in a case of this kind. The matter would have to be passed on by the legislature.'

* * *

The disgruntled ***'Vet'*** dropped into the office. 'Do you know,' he said, 'I have been studying this Government pension business a little lately, and from the standpoint of a taxpayer it doesn't look very good to me. As nearly as I can tell, a large part of the pension cost of the nation arises from the huge overhead expense of keeping up a small army of political appointees. Of course, I don't suppose that the average person, unacquainted with the idiosyncrasies of Government activities, realizes that the Pension Bureau as it now stands is a separate department of a bygone day and is quite obsolete insofar as it relates to the World War veterans. It is just a sort of clearing house for the handling of pension claims growing out of all the wars since the War of 1812, with the exception of the World War. The War Risk Insurance System is in no sense related to the general pension system. World War survivors don't receive pensions; instead they are granted compensation, insurance, hospitalization, vocational training, rehabilitation and numerous other high-sounding services, and it seems to me that these are granted sometimes irrespective of any preference on the part of the "vet" himself. After all the red tape he has to go through, if the veteran or his dependents knows "where he is at" he is lucky. Of course, the Veterans Bureau handles all this business, and evidently this bureau knows how to spend money. In 1926 they were given around $406,000,000. Of this amount more than $56,000,000 was spent for salaries. This looks to me more like politics than it does like good business. Congress seems always willing to give the bureau any amount of money it asks for. Perhaps this is because of the pressure of the "organized vote." Anyway, I have an idea that if the "disabled taxpayers" formed a protective association and demanded an accounting of the money that does not reach the disabled vets but goes into salaries for the upkeep of an exaggerated personnel, the results would be very rewarding.'

* * *

'It's odd how some of our pet phrases originate, isn't it?' queried ***the Psychology Teacher.*** 'Take for instance "Money to burn," which suggests the reckless spendthrift. The phrase probably had its origin in the imbecility of "Coal Oil Johnny," who figured in the early days of oil discovery in Pennsylvania, and whose notoriety was once embalmed in a popular song. Not satisfied with the ordinary and some extraordinary methods of wasting his substance in riotous living, he set a fashion of lighting his dollar cigars with ten-dollar bills.

'There is an old story, with perhaps a new moral, worth telling in this connection. Travelers in the English Midlands are shown a wide stone hearth in a posting inn known as the Turk's Head at Barnard Castle on which a costly fire is said to have blazed one winter's evening in the reign of the third George. It seems that one Jonathan Backhouse, member of an old Yorkshire banking firm, while putting up for the night at this inn, foregathered with a local squire who, having dined somewhat freely, lighted his pipe with a pound note. Enjoying the excitement aroused in the company by this action, the squire offered to burn banknotes with any competitor. To his surprise, the challenge was accepted by Backhouse, of whose identity he was not aware and who, being a Quaker, dressed very plainly. The two proceeded each in turn to throw a banknote into the fire until, sobering a bit, the squire called a halt. Later he learned that his opponent was the rich banker and that while he was the poorer for every Backhouse banknote that the squire burned, his opponent's bank was the richer.'

CAN YOU TELL ME?

QUESTION: From what is the abbreviation S O S derived?

ANSWER: This is a simple and unmistakable wireless message of distress at sea substituted for earlier C Q D (come quickly distress).

ǂ ǂ ǂ

QUESTION: What is the surface temperature of the sun?

ANSWER: 2,000 degrees Centigrade above the boiling point of carbon.

ǂ ǂ ǂ

QUESTION: How many acres comprise George Washington's estate and is it now occupied?

ANSWER: 'Mount Vernon,' George Washington's home, belongs to the Mount Vernon Ladies Association of the Union. Portions of the original estate that had been sold have been acquired again, and buildings which had fallen into ruin have been restored. The area of the estate is 237½ acres. It is kept intact.

ǂ ǂ ǂ

QUESTION: When the national flag is hung with the stripes vertical, should the field be at the right or the left?

ANSWER: When the flag is displayed over the middle of the street, as between buildings, the flag of the United States should be suspended vertically with the union or field to the north in an east-and-west street or to the east in a north-and-south street. When the flag is displayed vertically over a wall or window the union should be to the right of those who view it.

ǂ ǂ ǂ

QUESTION: How many Indians are there in the United States?

ANSWER: In 1924 there were 346,902 Indians in the United States.

ǂ ǂ ǂ

QUESTION: How many public schools are there in the United States? In Michigan?

ANSWER: In 1922 there were 276,881 schools in the United States; 8,721 in Michigan.

ǂ ǂ ǂ

QUESTION: What limitations are placed upon the President's pardoning power?

ANSWER: Presidential pardons cannot mitigate impeachment sentences. He cannot pardon offenses not against the United States. There is no presidential pardon for contempt of court of Congress.

ǂ ǂ ǂ

QUESTION: Has the House of Representatives any control over treaties?

ANSWER: Recapitulating, the President 'shall have power, by and with the advice and consent of the Senate, to make treaties.' The Senate ratifies negotiated treaties which if requiring the expenditure of money must be appropriated by the House. This has been a vital question in our history; and in a number of cases the House, after more or less discussion and bluster, has made the appropriations. Constitutionally, treaties duly signed and ratified are the supreme law of the land, and the House is morally bound to carry out their provisions.

ǂ ǂ ǂ

QUESTION: I have a list of German bonds. Do you think they will ever be of any value?

ANSWER: The Reichstag passed a complicated Revaluation Bill on July 16, 1925. Roughly speaking, state loans are revalued at 2½ per cent for new holders and at 5 per cent for old subscribers. This includes war and pre-war bonds, national, state and municipal, having a total face value of 70 billion gold marks. All mortgages and other debts on landed property, and debts of shipping and railway lines have been revalued at 25 per cent, but the owner of mortgaged property in certain cases can apply for another valuation of 15 per cent. Industrial bonds have been revalued at 15 per cent.

In this department we shall do our best to answer questions concerning Government and kindred matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

QUESTION: In a recent issue of THE DEARBORN INDEPENDENT, in an article on Lower California, the population of Lower California was given as 30,000. Can you give me a list of the towns in Lower California and the population of each separately?

ANSWER: The Mexican census returns do not give the exact population of each city or town, but that of the 'municipo' or district which corresponds to the county in the United States. The following are the districts of 5,000 population or over, according to the latest figures available:

Alamos	18,751	Tepic	16,800
Cananea	11,269	Augua Prieta	5,126
Guaymas	14,246	Arispe	5,175
Hermosillo	19,237	Magdalena	6,155
Novojoa	18,849	Oputo	5,758
Nogales	14,753	Rosario	6,100
Mazatlan	25,231	Acaponeta	5,000
Culiacan	13,500		

There was a typographical error in our article to which you refer. It should have read 300,000.

ǂ ǂ ǂ

QUESTION: What is the total amount of water power produced in the world?

ANSWER: The developed water power of the world in 1920 was about 23,000,000 horsepower, according to an estimate made by the United States Department of the Interior in 1921, through the Geological Survey. On January 1, 1924, according to the best information available, it was about 29,000,000 horsepower, an increase of 26 per cent in about three years. The increase was about 1,500,000 horsepower in North America, 3,400,000 in Europe, and 1,000,000 in Asia.

ǂ ǂ ǂ

QUESTION: Who appoints the federal judges and for how long?

ANSWER: Federal judges are appointed by the President with the confirmation of the Senate 'during good behavior.'

ǂ ǂ ǂ

QUESTION: Can any one of the states of the United States declare a federal law unconstitutional?

ANSWER: No. Federal laws can be tested as to constitutionality only in the United States Supreme Court.

ǂ ǂ ǂ

QUESTION: What is the military manpower of the United States, Great Britain, Japan, France, Germany and Italy?

ANSWER: Revised by the United States War Department as of August 31, 1925:

	Active Army	*Organized Reserves*	*Unorganized Reserves*
U. S.	138,236	253,821	11,697,943
Britain	152,626	207,143	99,000
Japan	210,000	1,503,000	461,000
France	685,459	5,280,000	890,000
Germany	100,000	Not Permitted	7,900,000
Italy	220,898	3,947,912	1,500,000

ǂ ǂ ǂ

QUESTION: What is the total bonded indebtedness of the several states?

ANSWER: The Bank of America survey shows that on January 1, 1925, the several states had a gross bonded debt of $1,558,742,434, which amounts to a national per capita debt of $13.89.

ǂ ǂ ǂ

QUESTION: What is the Pan-American Union?

ANSWER: The Pan-American Union is the international organization and office maintained in Washington, D. C., by the twenty-one American republics, as follows: Argentina, Bolivia, Brazil, Chile, Colombia, Costa Rica, Cuba, Dominican Republic, Ecuador, Guatemala, Haiti, Honduras, Mexico, Nicaragua, Panama, Paraguay, Peru, Salvador, United States, Uruguay, and Venezuela. It is devoted to the development of commerce, friendly intercourse, good understanding, and the preservation of peace among these countries. It is supported by quotas contributed by each country, based upon their populations. Its affairs are administered by a director-general and assistant director, elected by and responsible to a governing board, which is composed of the Secretary of State of the United States and the diplomatic representatives in Washington of the other American governments.

I READ IN THE PAPERS

Wheat vs. Gold as Monetary Standard

The Agricultural and Industrial Union, London, England, has as its object to 'point out the natural relationship which subsists between Agriculture and Industry, and to secure their effective co-ordination in the national life.' Realizing that the Gold Standard has 'seen its day and ceased to be,' the union advocates the adoption of a Wheat Standard. Its statement of general principles says:

'To achieve a true co-ordination between Agriculture and Industry it is necessary that some consideration should be given to that factor in the social organism which touches it at every point, namely: money, and its influence on prices. The main difficulty affecting increased wheat cultivation is the fluctuating return, measured in money, for the product. But the potential energy contained in wheat does not alter: its life-sustaining power is a constant: and while seasonable variations may be encountered, the average productivity of the soil, given conditions which encourage cultivation, is always progressive. Which varies in value—the money or the wheat?

'Those engaged in Industry are faced with an almost identical problem. Owing to continued alterations in the currency base and the huge structure of "credit" erected thereon, the industrialist is often placed in the position of not knowing the ultimate cost at which he can produce a finished article. This, as a result of currency (and credit) changes, may, during the time required to manufacture and market his production, differ considerably from the estimated cost. Which has altered in value—the measure or the goods?

'Under the fluctuating "standard" existing today, Agricultural and Industrial products are measured in what may well be described as terms of elasticity. The measurement of land by an elastic chain, or cloth by an elastic yard, is an absurdity. Yet the price of wheat, the base of all value, is expressed in an elastic money standard, and, conversely, the "value" of all articles measured in money is falsified. The principle by which the issue of money should be governed is the maintenance of the price of wheat at an average level when the world's harvests are normal. This, if done, would give security to agriculture in general, and wheat-growers in particular. Further, an influence would be set up which would tend to stabilize the costs of subsistence, on which wages depend, and costs of production, on which prices are based. Industry would thus be equally benefited, and a true re-union of Agriculture and Industry be brought about, a partnership in which the development of each would strengthen and enrich the whole . . . The union holds that the recognition and adoption of the principles set forth will effect the re-adjustment, on correct lines, of the social factors, and point the way to a higher plane of civilization.'

'When in Rome do as the Romans do' is no longer advice; it's a command.—*Wall Street Journal.*

'Ride a cock-horse to Banbury Cross,
To see a fine lady ride a white horse,
Rings on her fingers, and bells on her toes,
She shall have music wherever she goes.'

Unimaginative townfolk of Banbury, England, care little for the old nursery rhyme. The cross constitutes a menace to speedy traffic and it may be removed. But England is England and Banbury is beginning to hear protests at this ruthless proposal. Also a chorus of voices from Australia, South Africa, and the United States, is being heard protesting against the destruction of this shrine whose very name rings in the ears of every speaker of the English tongue.

ɛ ɛ ɛ

The 'yipe' of a dog whose tail was stepped on by accident was followed by the barking of five revolvers. Five persons were shot and three will probably die. It happened in Carver, Kentucky. A man accidentally stepped on the dog's tail. Men, a bit nervous, began shooting indiscriminately at each other without knowing who fired the first shot.

Youth and Experience

Ambrose Swasey, of Cleveland, is a famous maker of astronomical instruments. Among his more notable achievements was the making of the forty-inch Yerkes telescope, a 60-inch diameter for the Argentine National Observatory, a 72-inch reflecting telescope for the Canadian Government and a 26-inch instrument for the Washington Naval Observatory. Mr. Swasey also invented the range and position finder now used by the United States Government. On his birthday he wished two photographs made of his home. He notified a local photographer who immediately sent over his assistant, a breezy young chap—very efficient. Later this assistant reported that 'an old chap came out and wanted to tell me where to set my camera.'

'What did you say to him?' asked the employer.

'I told him that if he knew anything at all about the refraction of light he would know that I had selected the best place to take the picture,' replied the other.

'Great Scott,' exclaimed the startled employer. 'That old chap is the man who built the Lick telescope.'

The International Jew in 4 volumes: *The International Jew*, Vol. I, 235 pages; *Jewish Activities in the United States*, Vol. II, 256 pages; *Jewish Influence on American Life*, Vol. III, 256 pages; *Aspects of Jewish Power in the United States*, Vol. IV, 246 pages. Price: 25 cents each; set $1. THE DEARBORN PUBLISHING COMPANY, DEARBORN, MICHIGAN.

The Cowboy Comes Back

A shifting cloud of dust on the horizon. White faces bobbing up and down in the distance. Singing cowboys cutting in on stragglers running through the chaparral. Bellowing of Hereford steers. A desert sunset illuminating all. Ring of hoof and snaffle as the evening camp is made. Music about the fireside as the boys levy toll of the chuck wagon. Between numbers the long-drawn cry of a lean coyote, nose pointed to the stars as he wails his lonesome lament. Dawn breaks in a burst of sapphire and gold. Prairie dogs whistle on their mounds. The drive is on. Memories of the old Chisholm trail are freshened as Congressman Claude B. Hudspeth, of El Paso, drives 1,000 head of registered cattle from his ranch near Del Rio, Texas, on the Mexican border to the new ranch in Brewster County, Texas, a distance of 250 miles. Automobile traffic prevents their using roads and the cross-country trek is rough and sparsely settled. Rivers are forded, mountains crossed and hardships of sixty years ago endured by the hardy cowpunchers as they push the 'dogies' on to their destination.

Australia's New Capital

Canberra, Australia's new capital, is an interesting experiment in government administration. The new House of Parliament is only a temporary building costing about $2,400,000. It will be replaced in about seventy years. The federal territory of Canberra consists of 900 square miles, and the policy of the Australian Commonwealth is to retain the freehold of this territory.

Residential and business sites will be sold on 99 years' lease only and no lease will be granted to any save a British subject. No building will be more than two stories high, which will prevent congestion in the streets. It is impossible for the new city to spread unless the commission wishes, and there can be no slums because the Federal Capital Commission controls both building areas and plans. For the accommodation of visitors and officials the commission is erecting four residential hotels and four boarding houses on which the commission will fix tariffs. The minimum rate at the principal hotel where the M. P.'s stay will be one pound a day; at two others, 15 shillings; at the fourth, board and lodging for single men, two pounds a week; for married couples, three pounds five shillings a week and for single women, twenty shillings a week. Sports, amusements and entertainments will also be provided.

Canberra is the only state-owned city in the civilized world today and its operation is watched keenly by observers all over the earth

NOTES - COMMENTS - CRITICISMS

MR. FORD'S PAGE this week tells some of the implications of the motto, 'Everything has been all right, up to now.'

ɤ ɤ ɤ

Ontario has voted liquor back into legality; but Ontario's vote is not nearly so wet as it looks. It came about from a variety of causes. The vote was not a clear-cut expression on prohibition; party and church issues played an important part in the election, and other confusing elements entered in. A keen analysis of the situation is given by a Canadian newspaperman. (p. 6)

ɤ ɤ ɤ

Is 'average' the goal to be set before our school children? Shall we teach them that all that is necessary is just to 'get by'? These are questions vital to parents of today, for the answer of some instructors seems to be in the affirmative. And so one parent undertakes to discuss the matter from his standpoint, and that of his boy. (p. 1)

ɤ ɤ ɤ

'Here is the article on education which we talked about some time ago,' he writes, in sending in the manuscript. 'I have tackled it in a somewhat different way from what I originally intended and my plan is perhaps to start more people thinking. I would give more general direction but I don't know how.' (p. 1)

ɤ ɤ ɤ

No one can write of China in generalities: the country is too vast, too complicated. But through snapshots of the land and of its people, through little glimpses of this place or that person, a fairly comprehensive view can be given. This article does just that. (p. 14)

ɤ ɤ ɤ

Robert Burns, the poet, whose anniversary will be internationally celebrated on the twenty-fifth of this month, is known and admired the world over; but Burns, the exciseman, is not so familiar a figure. A writer who knows Scotland intimately introduces him in his capacity as 'gauger,' and shows how intensely human he was even as a government official charged with stern duties. (p. 22)

ɤ ɤ ɤ

Ages ago prehistoric man felt the urge to record his accomplishments. Some unknown human pecked away at the face of a rock with a rude, stone chisel—and became the world's first artist. The images cut by his successors—pictographs, we call them now—tell an absorbing story. (p. 12)

In the vanguard of Spanish writers of today is Don Pio Baroja. 'Humble man and wanderer,' he styles himself, but Don Pio is far from humble. He has all the fire and the verve of his Basque ancestors, and that fire fairly sparkles in his books. (p. 3)

Here are a few reasons why people read or do not read THE DEARBORN INDEPENDENT:

Chicago, Illinois.

You are hereby notified to not renew my subscription to THE DEARBORN INDEPENDENT, for the reason that for some time every issue has been filled with Christian superstition. Asiatic myth has no place with thinking people of the 20th Century. They know something about the crimes of the churches and the preachers. The injection of Christianity or any other superstition into the paper will do the paper no good but a great deal of harm.

LEWIS M. ELLISON.

Ames, New York.

Your magazine is very helpful to me as a supplement to my other reading matter. I like the treatment you give of subjects and find the issues well worth preserving for later reference.

In its present form the paper is to be highly commended for make-up as well as contents. I never lose an opportunity to speak a favorable word for it. I believe it adds a strain of material to the mental equipment of a man in my work that could not be obtained elsewhere.

I wish to take this opportunity to express my satisfaction with the editorial policy, and general content of THE DEARBORN INDEPENDENT.

REV. J. E. MCINTYRE.

Herrin, Illinois.

Your refreshing weekly has been a visitor to our desk for many months and we have meant to write you in appreciation from time to time. We want you to know that it is one of the newsiest and most unique papers that we receive and after reading it we always take it home and it is reread there.

We are writing you also to ask permission to republish in our papers some of the Lincoln stories that have recently been run in THE DEARBORN INDEPENDENT. Will you kindly grant me permission to use these articles provided we will attach to the article the proper credit? We do not want to take any undue privilege and are therefore making this request. Any time we can reciprocate feel free to call upon us.

Yours very truly,

HAL W. TROVILLION.

Publisher the Herrin *News*.

Washington, D. C.

I would like to have THE DEARBORN INDEPENDENT remain just about as it is and not specialize in fields adequately covered by other journals. I read it more carefully, I think, than any other journal I take, and I take about a dozen. I like it because it is different and gives new lights upon matters of importance neglected by others. I like its wholesome and sane attitude toward life.

T. L. L. HILLER.

Boulder, Colorado.

I read THE DEARBORN INDEPENDENT because all the articles interest me. Reading matter today reminds me of ore, most of the ore must be milled before sending to the smelter, a lot of it is not worth the milling, while some may be sent direct to the smelter without rejecting any waste.

JAMES G. LEECE.

GAMALIEL BRADFORD is one of the best known writers in the country. His latest book, *Darwin*, has been widely acclaimed, as were *Damaged Souls* and *Bare Souls*. His poetical works include *A Prophet of Joy* and *Shadow Verses*. (Facing Page One)

PUTNAM PHILLIPS is a pseudonym. The writer of the article is one of the best known authors in the country, but he desired that his name not be divulged so that he could speak with perfect frankness. (p. 1)

V. S. PRITCHETT is European correspondent for the *Christian Science Monitor*. He has a wide acquaintanceship among statesmen and men of letters, and has written numerous delightful interviews and articles interpreting them. (p. 3)

DR. JOSEPH COLLINS is again in the literary spotlight with his latest book, *The Doctor Looks at Love and Life*, listed among the most popular of the year. Before he turned his talents to writing, he was recognized as one of the country's leading neurologists. He holds several university degrees. (p. 4)

CHARLES VINING is a Toronto newspaperman. He has lived in Ontario for years and is thoroughly familiar with the political conditions which brought about the recent 'wet' vote. (p. 6)

LADY CYNTHIA ASQUITH is familiar to readers of THE DEARBORN INDEPENDENT for her interesting articles on various topics. She is the daughter-in-law of Herbert Asquith, former premier of Great Britain. (p. 8)

A. E. JENKS, professor of anthropology at the University of Minnesota, is one of the foremost ethnologists in the world. He combines technical knowledge with an ability to write lucidly and interestingly. (p. 12)

WILLIAM E. BARTON is well known as a biographer, as a clergyman and as a traveler. He gives some random impressions of China. (p. 14)

HUGH WALPOLE is one of the outstanding English writers of the generation. Known best, perhaps, for his novels, he is also recognized as a master of the short story. Mr. Walpole is at present in America. (p. 16)

PEACOCK *and* PEASANT

—International Newsreel.

Find the peasant shepherd in the Hungarian pastoral scene above. During summer's heat as well as winter's blast he wears his magnificent covering of lamb's wool. This garb is disconcerting to the flock, the members of which probably distinguish their master by the fact he doesn't eat grass.

Right—*This isn't everyday regalia we see being worn by a Kavaranda warrior of East Africa. He's made up for parade day, which is a glorious time for these natives who have an inherent love for personal ornamentation. He holds a lion-skin shield and has a crown of rare plumes which is his pride.*

'IF'—*the* Dark Side *of* Polar Flying

By RICHARD EVELYN BYRD, U.S.N.
First Man to Fly Across the North Pole

'WHAT would you have done, Commander Byrd, if you had been forced to land on the ice pack?'

That question has been asked me a thousand times since I returned. It is the natural question for people to ask. In the first place, the Arctic has always been greatly feared; second, excitement over exploration comes as much from its hazards, I believe, as from its achievements. I may seem to be putting exploration on a low plane. Also I may be suggesting that people's minds are morbid. But this is not true.

Man's strongest instinct is self-preservation. When a man puts his life in danger his thrills are not the only ones experienced. Everybody who knows what he is doing feels a vicarious thrill.

It is a good deal like a crowd watching one of those 'human flies' climb up a side of a building. The crowd stands awe-struck. When the human fly reaches the top the crowd gasps with relief. For days afterward everyone who saw the ascent shudders when he or she thinks what might have happened had the man fallen.

I do not remember people asking me what I should have done had our plane crashed out over the ice pack. In fact, it was that question I asked myself and my men for months before I left. I asked it eagerly of everyone who knew anything about the Arctic.

With that question in mind I studied Arctic literature. With that possibility hovering over me like a shadow I planned every detail of my trip and every item of my equipment. I had to be prepared for the worst.

Last year Amundsen tried to fly to the Pole, but only landed near it. He had the bad luck to encounter fog. This prevented his taking astronomical observations.

In consequence he was forced to land to find out where he had been, and then things went wrong.

As he had to some degree anticipated, he discovered that his trouble started from the moment his plane touched the water of the lead or ice crack, into which he plunged. There wasn't enough water to take off promptly again; and the lip of the ice floe overhanging the lead was too high and steep for his handful of men to pull the heavy plane out on to the ice

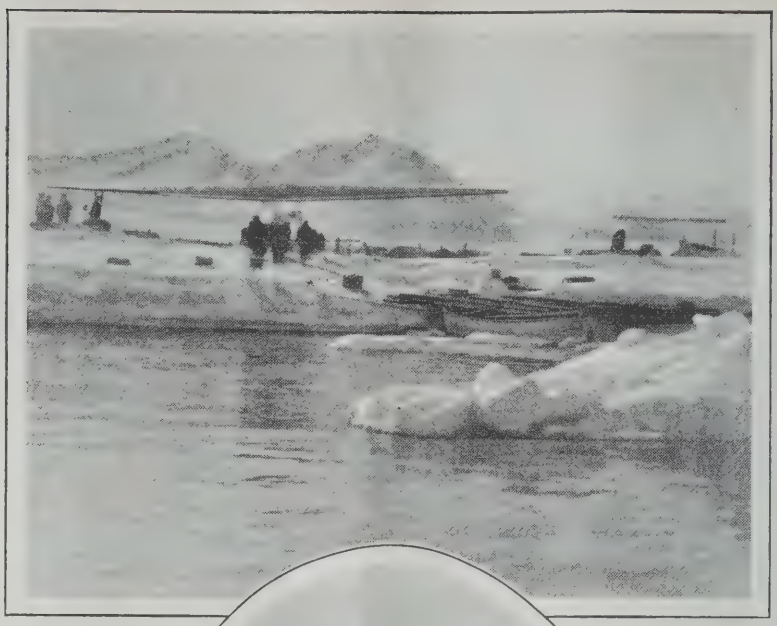
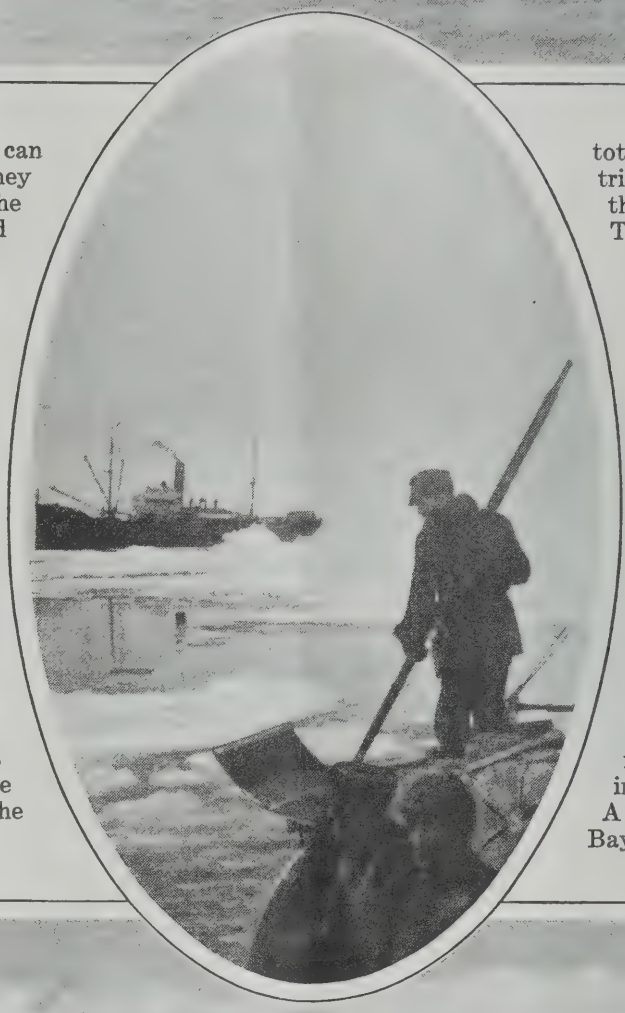
pack. One plane was crushed. The other, after tremendous exertion by the men, was dragged up on the level floe.

While the world waited in great suspense, Amundsen faced the most critical situation in his whole life. He had his choice of leveling off enough ice and snow to get the plane into the air; or of taking his light equipment and marching back to Cape Columbia, about four hundred miles to the southward. It is significant that, despite the terrific task on hand, Amundsen and Ellsworth both preferred to take a chance with the plane to trying the long walk south. As far as I can gather, they reasoned that if they could get the plane into the air, the flight back to Spitzbergen would not be a serious risk. Plenty of fuel was left; and the plane was undamaged. In contrast, a 400-mile journey over shifting floes was not inviting. Even were the surface level, such a foot journey would be a struggle. With constant pressure ridges to be encountered, and open leads spaced along the way, there was no assurance of escape.

As matters turned out, Amundsen did the right thing. He usually does. After removing 500 tons of ice and snow, twenty-six days after his departure from King's Bay, he got his plane into the air with all his men aboard and flew safely back to his base. Few persons besides Amundsen and his party realize what a terrifyingly close shave he had had.





I kept Amundsen' story in mind when planned my own expe dition. Also I had i mind a very clear pic ture of the area ove which I would fly. knew it would be fatal t underestimate the per Bennett and I faced

The details of thi peril were almost math ematical in their cer tainty. The Polar Se is roughly 2,000 mile in diameter. It contain something like three mil lion square miles o open water and floatin ice pack. Near the Pol its depth is about te thousand fathoms. Thi great area is uninhab ited. Game within i appears to be eithe totally lacking or so widely dis tributed as to make it impossible fo the traveler to depend upon it.

The ice in the Polar Sea is ap proximately forty feet thick. Thi thickness varies as a result o precipitation and melting. Ic floats with seven-eighths of it volume below water. In conse quence, when tide or win cracks the floes and cause what are known as 'leads,' th shores of these leads are vertica ice edges six or seven feet high Wind impinging on the billion of little sail areas of the roug ice carries the pack back an forth with incalculable forc Tidal currents working beneat the pack work invisibly mear while. When the pack starts t ward land, icebergs, weighin millions of tons, lift up over th reefs and push shoreward wit irresistible violence.

A year or so ago the ice of Baffi Bay was moving (Continued on page 2

The World's Champion GUESSER

Joseph S. McCoy *Tells* Congress *How to Cut* Your Taxes

By M. L. RAMSAY

THIRTY-EIGHT years ago an eager-eyed inventor shouldered his way into the Government actuary's office in Washington, lugging a cumous wooden case. The top of this se was studded with rows of thin etallic buttons like the crude type-iter keys of early manufacture.

'This new calcuing machine of ne will add figures ster than you can it in your head,' told a youthful d very green acary. It was the tuary's first day on e job. 'Will you it for me?'

The new Governnt mathematician s obliging. But if is machine would lly add figures rapy, was it supposed do anything else?

'Well,' the inven- hazarded dubisly, 'it *might* mully.' The actuary's rdict, the next day, s that the machine s 'a pretty fair calator.' 'Give me example,' he ded quietly, 'in long division.'

And as the inventor watched, cinated, his device reeled off the ures and the correct quotient. To nch the point it solved a long divin twice, under the actuary's flying gers, while the inventor worked it t once with a pencil.

Thus began the careers of a new chanical marvel in the business rld and of Actuary Joseph S. Coy as Uncle Sam's super-mathemaian.

In the Smithsonian Institution you ll find the contrivance that McCoy covered could subtract, multiply, d divide, as well as add, bearing a d relating that it was used for enty-one years by McCoy, and that maker was Dorr E. Felt. Felt, now sident of the Felt and Tarrant anufacturing Company, was the inntor who persuaded McCoy to test then unproved calculating machine.

The sole defect in this story is that, to McCoy, it illuminates chiefly mathematical side. For McCoy is re than a mathematician. He hitches statistics to the law of averages and a penetrating knowledge of human nature. Then he discovers new uses for that strange team, as he did for Felt's machine that *might* multiply.

'The world's champion guesser,' better epitomizes McCoy's talents. He invented all the war taxes which swept into the Federal Treasury the billions needed to beat the Central Powers. He 'guessed,' in each case, how much the tax would produce. Ever since he has been advising Congress and the Treasury Department in their efforts gradually to abolish these taxes, without crippling the Government's operations. The statistics and estimates of revenue forming the backbone of every tax and tariff measure enacted since 1909 have been supplied by McCoy.

—Underwood & Underwood Photo.

Joseph S. McCoy with a variety of types of adding machines, including a Chinese abacus.

Astounding accuracy has been shown in his forecasts of the amount of revenue these measures would bring in, forecasts made at least a year and often two years before the taxes and duties were collected. This is why official Washington has dubbed him the champion guesser.

Secretary of the Treasury Mellon expressed Washington's attitude when he outlined to Congress some months ago his views on tax reduction.

'Mr. McCoy has his own method of figuring,' said Secretary Mellon. 'I confess I do not always understand it. But he certainly obtains remarkably accurate results.'

In the long and bruising fights over tax reduction which every year or two divide Congress into hostile armed camps, McCoy fights valiantly for both sides. Sometimes, as at the last session, he fights for three sides, all at the same time.

When a specific reduction is proposed, no matter by whom, McCoy calculates how much revenue the reduced tax will bring in annually for the ensuing two or three years, and how large a surplus should be left in the Treasury.

The tumult and statistical broadsides end at last, and McCoy makes his painstaking final estimate of the revenue the complicated new tax bill will yield. Until this is done Congress never writes its measure into law. This applies regardless of what party or coalition of forces has won.

Usually McCoy's estimate and the amount actually collected by the Government a year or two later are startlingly close. Uncanny precision was shown by McCoy in 'guessing' the yield of the complex Underwood Tariff Law in 1913.

He has foretold with amazing accuracy what the various income tax schedules would produce.

His forecast on the corporation tax, too, will be long remembered by those who sat on the Congressional finance committees. This forecast was made in 1913, for the year ending June 30, 1915. McCoy calculated that the tax would yield in that period about $39,000,000. Actual collections two years later were found to be within $144,000 of his estimate!

McCoy's 'guess' on the war-time excess profits tax, which by the way he invented himself when directed to find a tax that would curb profiteering and as a secondary consideration bring in sorely needed

Wall Street, Coolidge *and* Nicaragua

A Trio of Forces *Whose* Functioning *Means Much to the* Nation's Future

By CORNELIUS VANDERBILT, Jr.

THE Nicaraguan controversy will, in all probability, prove a great deal more difficult to deal with than is at present anticipated: this for the reason that certain factions in Wall Street aim at supremacy in Central-American politics, regardless of cost; and that President Coolidge, having knowledge of this, is not entirely inclined to agree.

For years, one might almost say since the beginning of the 20th Century, Nicaragua has been a smoldering fire of financial fracas. In 1901 an agreement was signed between Costa Rica, Salvador, Nicaragua and the United States allowing perpetual lease to this country of a six-mile-wide section of Nicaragua. In 1916 our Senate ratified the treaty which gave us the right to build an interoceanic canal within this strip of land by the payment of $3,000,000. In 1923 a protocol was signed by Costa Rica and the United States allaying any further objection to the building of this canal, provided the United States consulted Costa Rica as to the exact route to be followed as soon as the United States should determine where it was going to build the canal. During the Harding Administration negotiations were once more opened toward proposing to Congress the building of the canal, but were dropped when Secretary of War Weeks' estimate of the cost showed that such an attempt would have proved foolhardy at the time.

IN 1911 Adolfo Diaz, then president, caused the same type of rumpus which he brought about the other day, by reporting to the United States State Department that other countries were running munitions and forcing the hand of Bolshevistic influences in Nicaragua. At that time, as today, men-of-war were rushed to the scene, marines and bluejackets landed, and forces kept on hand continuously to prevent any untoward attack upon the government. This was done in 1911 principally so that neither Germany nor Great Britain could secure a hold by force or otherwise upon the land held through treaty with us. Today it has been done for a completely different reason.

Since 1925, when our troops were withdrawn by Acting Secretary of War Davis, a man by the name of Chamorro became president by a *coup d'etat*. Chamorro, while opposed by the faction supporting General Mena, one-time secretary of war and later president, whom the Taft Administration supported, split his country's vote until just recently, when by force of the Wall Street financiers Chamorro was obliged to resign in favor of Diaz once more.

Though there had never been any open strife during the Chamorro tenure of office, there had been, our State Department was secretly informed, much trafficking in illegal entry of arms and ammunition from Mexico. To this, as guardian of the Monroe Doctrine, and as chief signatory power for the Pan-American Congress, this country strenuously objected. The Soviet tendencies of Mexico, as well as her out-and-out Bolshevistic pronouncements, led our diplomats to fear that through a system of unrest she was planning her own *coup d'etat* in Nicaragua.

THE State Department was thoroughly aroused by April, 1926, at which time an American trading company doing an extensive business in Central America announced that it was unsafe for its carriers to do business there unless fully armed. Some months later former Secretary of State Hughes, who had, a few years before, completed certain treaties with regard to the Pan-American countries, was called into conference by the President to give his opinion as to what sort of action should be taken.

The Coolidge economy platform is too well known to expatiate upon it here; suffice it to say that the President did not look upon the Central-American condition as did the former Secretary of State; else marines, bluejackets and possibly troops would have been landed there then. Instead, State Department officials in Central-American countries were told to advise the ruling dignitaries of those nationalities that the United States would not tolerate the fostering of further revolutions in its domain.

For a time, things again proceeded quietly enough, at least to outward appearances; and then suddenly there were landed at New York a large number of sailors, pressed into service, according to their own stories, while serving aboard a small trawler in Caribbean water, and forced to help smuggle arms, munitions and troops into Nicaraguan territory. From what could be learned from them, it seemed as though this trip had been planned directly from the United States, and suspicion was cast on Dr. de Vaca, representative of the Nicaraguan Liberal movement in Washington. Whether evidence was obtained or not cannot be learned from State Department circles; but much information seeped through from Mexican channels.

AT APPROXIMATELY this time, it will be recalled, the State Department sent for Ambassador to Mexico Sheffield. When Mr. Sheffield is permitted to make his mission known it will be found that the United States, in terms more strenuous than previously, will state that ships of any nationality flying any flag will not be permitted to land munitions in any Central-American lands.

And now we come again to the hand of Wall Street in Central America. It cannot be denied that the functions for which the Panama Canal was constructed have been taxed to the limit, and that another canal is urgently needed, particularly as it would probably take six to eight years to complete such a project. Nor can it be denied that the Pacifists, aided by Soviet propaganda for world peace, would align themselves against such a move for the reason that its cost would be prohibitive and that it would be construed by them only as another incentive for war.

But Wall Street, eager for new fields of conquest, is thinking principally of the rich, undeveloped resources of Central-American lands, and of the world trade which would be brought in ever-increasing volume to the doors of all, by enlarging the possibilities of international trade.

PRESIDENT Coolidge, on the other hand, deems it more important to cut taxes, reduce expenditures, and consolidate the spending power of the Government, than he does to increase such to the extent of providing additional means for aiding the bankers' purse. The lowest engineering appraisal of the Nicaraguan canal is said to be in the neighborhood of $1,000,000,000. It might even cost $1,500,000,000. On such a foolhardy waste Mr. Coolidge does not at present cast a favorable eye.

Should the financial powers of this country overrule the presidential voice, a canal almost twice as wide as the

Panama Canal and nearly three times as long would be constructed. From six to eight locks would have to be built, for which water from Lake Nicaragua, a body of water more than sixty miles long, would be used; and passage through this lake would also be provided. Two mountain ranges would be intercepted, though at no place would there be as extensive work done as there had to be at the Culebra Cut, in the Panama Canal. The canal would shorten the present route from coast to coast by more than 600 miles, or from one to two days' trip. It would increase world trade more than 1,000,000 tons a day.

FROM a territorial point of view, the construction of this canal would possibly be opposed by railroads in this country, as it would immediately when opened tremendously lower water freight rates from coast to coast, as well as vastly increase the speed of such deliveries. Yet with the increased volume of trade in the United States, it is quite possible most of the great railroads of the land would have no objection.

Two naval bases of importance to the United States would at once come into being; one in the Bay of Fonseca on the Pacific side, the land for which the United States has already secured and paid in her treaties of 1901 and 1916 with Nicaragua; and the other between Livingston and Barrios, in Guatemala, on the Atlantic side and within a few miles of British Honduras.

The Pacific base could be used to good advantage in case of trouble with Japan at some future date. From here it would be but a few miles to Salvador and Guatemala, through which later on American capital could extend and link the Mexican railways, thereby providing a chain of steel the entire way from the Texas boundary. The Atlantic base, in a pocket of the Caribbean Sea, and not so many miles from the Yucatan Channel, would serve a good purpose by protecting American tankers in their convoying of oil from the Yucatan fields to and from the canal zones, and for the protection of American industries in the West Indies.

With the possibility of the United States going into the shipping business on an ever-increasing scale, the Nicaraguan canal would prove to be entirely compatible; but its extremely high cost, the dangers of continuous Central American revolutions, and the numerous other obstacles may present themselves to Congress as they do to the President at this time. That is why in many circles it is said that the present Nicaraguan trouble is merely a repetition of the age-old policy of 'dollar-diplomacy' to which this nation resorts whenever Wall Street gets the upper hand in our State Department, and puts its dollars above the price of the liberty of less wealthy lands.

The Deadly Fiddle Tinkerer

Making Good Bad *and* Bad Worse

By CLYDE WIER

OF ALL the banes that ever infested the fiddle world, the most deadly is the fool who sedulously and interminably tinkers with his fiddle. For some reason it never suits him, it is never quite right, it needs adjustment; so he proceeds to adjust.

If he is a mild sort of tinkerer, with some feeling of compassion for his instrument, he will first experiment with the size of the strings. And as each size of string has its own peculiar tone quality and 'feel' under the fingers, and as each change in the tension of the instrument works a corresponding change in response, he soon becomes confused and loses entirely his comprehension of the results of his experiments. So he is apt to leave the instrument strung with the most undesirable strings of all. And the next time he plays he will change the strings again, and so on until he has grown old enough to follow after other devices.

Another is afflicted with a vice which we might term the bridge vice. He possesses bridges of all sizes and thicknesses, heights and archings. He feels that at home he must use a low bridge while in a music hall he needs a high one. Then, too, the quality of the wood is his care and concern, for he has heard talk about curled grain, straight grain, weights, densities, and so forth, so he must be sure to find the right bridge for the right occasion. His fiddle never sounds musical, for it is always on the brink of nervous prostration. He concludes after years of patient and foolish endeavor that the violin is not what it should be and thereafter renounces his devotion to strings.

ANOTHER is addicted to the post vice. It becomes his Sunday duty to change the post in the old fiddle. In the beginning he used to shift its position; but some one had told him that the post was the soul of the violin and that different souls were the equivalent to different instruments, so he got himself a full supply. What if the top does become marred by the ceaseless change, and the bottom distended, and the *ff* holes disfigured and finally ruined?

The over-sedulous crank will even cut away the *f* to get more room in which to work. He may use a regular post setter or he may resort to that more primitive device, a piece of string. Men have been known even to cut into the *f* hole on the opposite side to facilitate the manipulation of the string. This for a good instrument means ruin. To repair the damage done to the top by the constant moving of the post, an inlay must be set in, which utterly changes the temper of the instrument, while patches are to the *ff* holes what grafted cuticle is to a once fair face.

And now the age of real crime begins. When the tinkerer musters up the courage to remove the top and attempt to take out the bar and fit another, then it is time for the fiddle world to cry, 'calamity.' But his desecration is in a measure successful. He has fitted the bar, but he is not entirely satisfied; so bar follows bar in close succession, with more or less disaster to the tone every time.

SOME ship carpenter or noctambulant loafer had probably told him that the thinner the top the greater the carrying power, and he had believed it. So now his Fried. Aug. Glass is reduced to a mere shell that shrieks on the E string and groans on the G.

Then we sometimes meet the refinishing fiend. He does not like the appearance of his instrument. It is somewhat worn, it has been cracked and reglued, looks rather old and behind the times. So he washes the top with alcohol, seeks a suitable stain and goes to work. I have heard of a Strad being so treated, and have seen a Bergonzi and Testore thus utterly ruined. The man who revarnished the Bergonzi considered himself a real violin maker.

Besides these major atrocities perpetrated so often by men who should be better occupied, there are minor ones almost equally disgusting. One man hangs his violin out of the window on the lee side of the house throughout a rainy day to give it a chance to absorb moisture. Another insists on blowing into the *ff* hole for a half-hour before playing, because he feels that a half-hour of breath may inspire sufficient soul to insure a fine tone. Another sits before a hot fire and rubs the instrument diligently across his knees, feeling that such friction will aid materially that of the bow, all unmindful of the havoc that he is playing with the varnish.

It is not unusual to see a name carved on the back of a violin or cello. Perhaps for ownership or identification it has its merit. We cry against vivisection and its attendant evils. The end of vivisection is merely death, while that of fiddle mutilation is a hopeless despair that cries out in vain to heaven forever.

Faking *Antique* Furniture

By ARTHUR C. PARKER

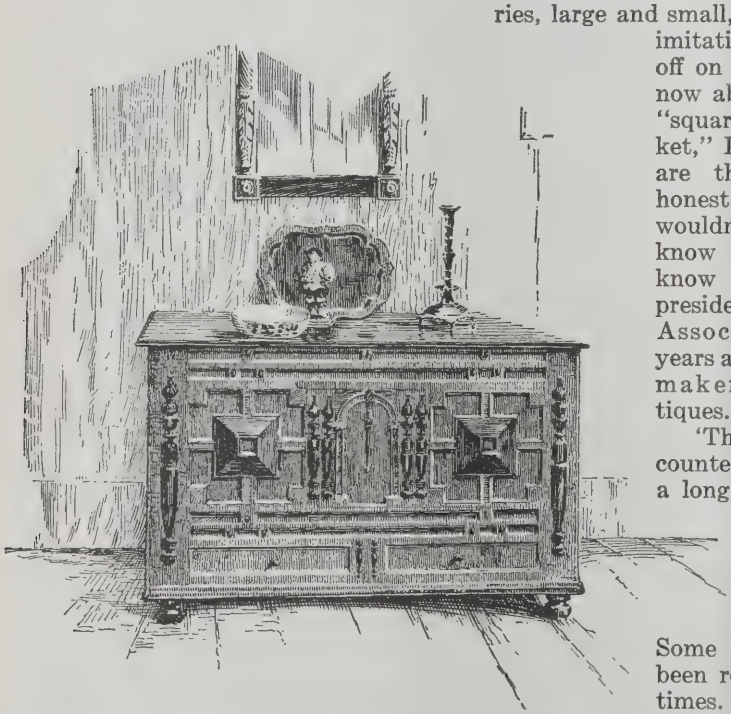
WHO makes all the antiques? This question seems fair enough when towns abound in 'shoppes' where old furniture, dishes and other antiquities are sold. Every few miles on every country road, in the East at least, farmhouses and remodeled barns display the alluring sign, 'Antiques.' The word is enough; it has a magic attraction. But whence come all the jugs, bottles, Bennington ware, chairs, highboys, mirrors and clocks?

Hoping to find an answer to this knotty question, and wanting a few antiques myself, I walked up the driveway of a home on a quiet street, and worked my way into a shop in the rear. There was the sound of an angry voice, the response of another voice in a high argumentative tone. I listened.

'I tell you, I'll have nothing to do with your scheme!'

'But it's a good one; everybody's doing it. My house will ship you the antiques on commission; you needn't put up a cent. They are as good as any antiques ever made and better—we do things right!'

'Right!' ejaculated the other voice, the rumbly one. 'Right! Does selling faked-up furniture as the real thing sound right to you? Say, young fellow, how do you ever sleep?'



'Now get me, Mr. Cady,' argued the other voice. 'We are not going to charge a high price on what you sell. It's all dirt cheap. You can make up to three hundred per cent, same as you do on the secondhand country stuff. My proposition is fair and square and it's a money-maker for you!'

'I don't want that kind of money,' said the rumbling voice, 'and what's more you get out of here before I kick you out!'

In a moment out came a sleek young man looking a bit disconcerted. He came folding up a roll of photographs and tucked them in a large portfolio as he hurried out to his car.

Then I went in to the inner shop to find an answer to my question. I found Mr. Cady purple in the face and pounding a half-polished table, exclaiming the while, 'Of all the nerve, of all the nerve!'

'Mr. Cady,' I began, 'I have just come over to ask you where all the antique furniture comes from. You have the reputation of being the squarest dealer on the market, and maybe you can tell me.'

'Did you see that fellow who just went out? Well, I don't get any from him. He came with the same jolly as you, about me being the "squarest" and all that. Said I could make three hundred per cent. He is traveling for a firm that makes the best imitations I ever saw—but then I've repaired some, too, and they are not so good, then. The fact is that there are many factories, large and small, turning out clever imitations that are palmed off on the unwary. And now about my being the "squarest on the market," I am not, for there are thousands just as honest as I am, who wouldn't sell fakes. I know them and they know me. I was once president of the State Association and even years ago we talked of the makers of bogus antiques.'

'Then there have been counterfeiters at work a long time?'

'Yes, a long time, and much of their stuff is in the best of homes. Some of it has perhaps been resold half a dozen times. The very fact that it comes from a fine home to the market seems to give it prestige and acts as a guaranty of authenticity. Just come up here.' And he led me upstairs into his workshops where his men were repairing and refinishing antiques—a legitimate undertaking, of course.

In one corner was a high desk of beautiful wood. It was carved in the approved Empire style, and was really an attractive piece. I said as much, which I thought might please him, since I was counted as an expert in such things, coming from the city museum.

He laughed. 'That's what I wanted you to see. Mrs. Harper had it and wanted me to repair the drawers which stuck. I got inside the thing and then showed her how it was made. She gasped and gave it to me; it's a fraud, but she paid four hundred dollars for it. I sold her a real one for less.'

'Where do you get your genuine articles?' I asked.

'The country is full of them yet, but of course they are getting scarcer,' he replied. 'I don't buy many now because I am making a business of refinishing and reconditioning, but many very fine pieces are still in old homes. Of course dealers have cornered many of the really good pieces, but you can still get them.'

A FEW days later a young man with his first job came in to see me. 'I'd liked to have worked here,' he said 'but I am working in a fine place now.'

'What are you doing now, George?' I asked.

'I'm whackin',' he replied with a laugh. 'I whack chairs with tire chains and of course I am learning to varnish and rub too.'

'Whacking?' I repeated. 'What in the world is that?'

He laughed again. 'That factory down by the river is making antique chairs, too, as well as regular ones and I whack the "old" kind to put in the dents. We knock 'em, plane 'em down, soak 'em in ammonia and in acid, and even burn them sometimes. When they are done they are as used up in looks as real old ones.'

The youth did not seem a bit abashed at his trade, and in fact took it as a joke that he could do his part so well. Then he went on, 'But I don't know half as much, nor a quarter, as

Potter. He can do anything, can make old paint, old varnish, make copies of anything. You ought to have him in the museum, he could make antiques for you—none better.'

And so it went. From far and near came the gossip of the underworld of furniture fakers. I couldn't escape the evidence even when taking a ride into the country to clear the cobwebs of doubt from my bewildered brain, now shocked into doubting everything.

OUT on the Lake Road, far from the deception and speedy business of the city, I found a quiet farmhouse displaying the modest sign, 'Chicken Dinners.' I went in and there found myself in a place of alluring charm. There were ntiques to the right of me, antiques to the left, upstairs and down cellar. Of course I had to hang my coat upstairs, and go down cellar to see the stock of pickles and canned fruit, which was for sale.

Not a word was said about antiques, only pickles, eggs, honey and maple syrup. It was all so rustic, but as the dinner was excellent my suspicions were allayed along with my hunger. Still, I was itching to talk about the old sideboard, the candlesticks, the andirons, the mirrors and the grandfather's clock. Could it be that any farmhouse in this part of the country had escaped the mid-Victorian madness, and had retained the furniture of the late 18th Century and early 19th?

I asked a few discreet questions and found that the 'farmers' had been in possession of the property only a bare two years. They had moved in from New England, and were trying farming for John's health. No, they never sold antiques, but folks had begged for a few things, and didn't know but they'd have to let some go. Many wanted modern things, shiny things from town; so much easier to keep house with.

THE sideboard? Oh, they had been offered twelve hundred dollars for that. The Windsor chair someone had tried to pry loose for fifty, and the hall table was worth over a hundred. Yes, I could come again, and here are a few cards to tell about the chicken dinners —glad you liked them.

Then I sent my wife on a tour of investigation—well, as a sort of detective. What a woman can't find out of a gossipy nature no mere man can ever hope to capture. The next day I received my report.

'Mrs. Loomis is their aunt,' my informer stated. 'The farm is hers, and they get their antiques on consignment. They sell on commission, and have sold a great quantity. The Curry Carting Company goes out there regularly.'

And so—and so I am still wondering who makes *their* antiques!

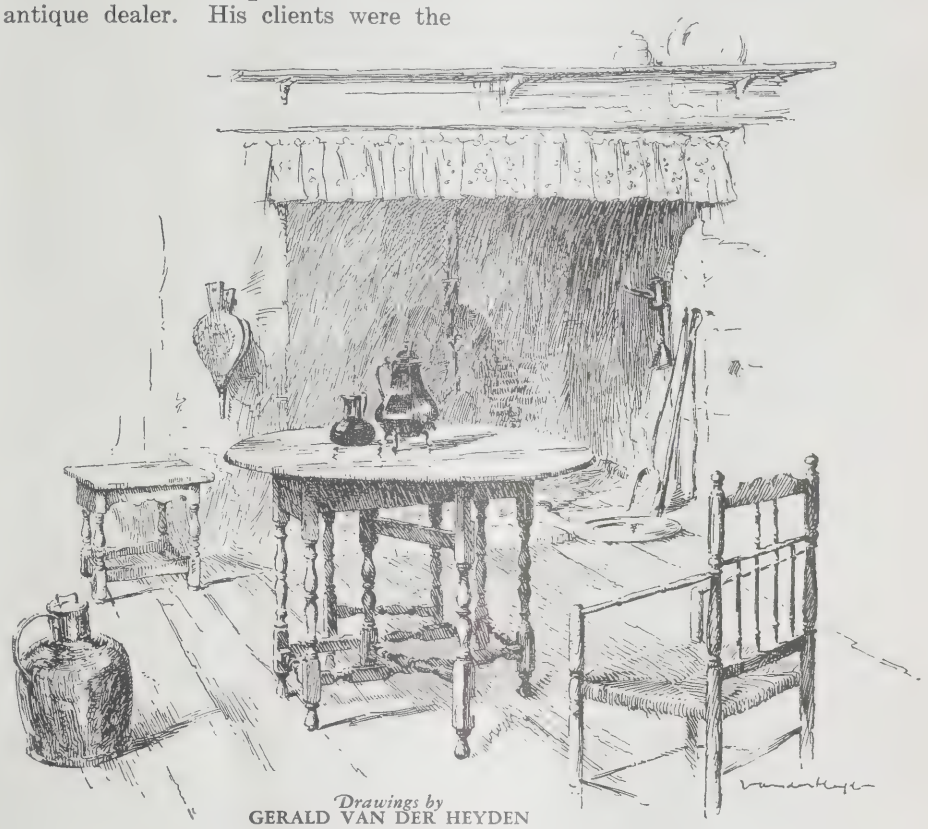
I have been prowling around much since this experience and have found that there is a good market for old lumber of used or unused grade. Old wagon shops, old carpenter shops, old mills are visited by agents seeking to buy up suitable wood, if old and stained. Who gets it, and what is it used for?

In a certain well-known town, famed for its old American aristocracy, was a discriminating and successful antique dealer. His clients were the most élite, and he swore by his goods—literally. As he did an extensive repair business, he employed a number of cabinetmakers and finishers. It excited no comment for a while. Then it is said that certain of the élite began to suspect something wrong, for the story was told that a certain lady saw in his shop the duplicate of one of her old pieces. She sent a friend to the shop to investigate quietly. Questioned as to the authenticity of the piece the dealer said,

'Genuine, I should say so. *This* piece is absolutely genuine—I'll take my oath.' He had tapped the leg of the piece of furniture, to emphasize his statement.

An investigation of the leg of the real piece in the lady's home disclosed the fact that under guise of a repair job a leg had been removed. The supposition is that the cabinetmakers of this dealer had reconstructed and duplicated her choice piece and had attached a genuine leg, the very leg which the dealer tapped and swore was genuine. The wood for the counterfeit had come from some old mill or furniture factory.

Later, a man who had been approached with the proposition to become a partner of the dealer told me that he had investigated the offer and had almost entered into the deal when he discovered that most of the profits came from faking. Good old pieces were torn apart and out of them, by substituting parts, duplicates were manufactured by use of old pieces of 'doctored' lumber.



Drawings by
GERALD VAN DER HEYDEN

Good old furniture is loved for its craftsmanship. Many persons seek it because it is not only beautiful, but well made. It is filled with suggestions of the romance of olden times, before the age of factories.

A lady member of the family, with these thoughts in mind, found a beautiful, inlaid desk in a furniture store. It was listed as a real antique. It looked good and the purchase was completed except for the passing of the money. Then the lady pulled at one of the drawers. It stuck. The salesman gave it a vigorous pull and off came the front. It had not even been nailed on, and the glue had given way. Still, the dovetailing showed conspicuously, the wood being colored so as to set off the dovetails—but the dovetailing had only been simulated by chiseling in the pattern. This was not craftsmanship nor was it an antique. The lady without another word turned on her heel and walked out. When dealers buy worm-eaten wood and fabricate their antiques, whom shall we trust? Where, oh where shall we buy antiques that are real? There can be but one answer —hunt for them, and be not too eager. Pay reasonable prices and do not make frauds profitable.

When One *Plus* One *Is Really* ONE

By DONALD A. LAIRD

THERE is no catch to this: One and one really make one. If they did not we would be bumping our shins continually, counterfeit bills and bonds would be more difficult to detect, and much of the military usefulness of the airplane would be lost. And grandfather would have been entertained differently by grandmother when he was courting her!

When ancient people wanted an idol to express all-seeing powers they made one with only one eye, a great eye in the forehead. The Cyclops was a one-eyed god. But the one eye, if it really could see, could not compare with the two eyes of mere humans, regardless of how large or how powerful it might be.

Look at your watch with only one eye and then with both.

Chinese painters, until very recently, were not aware of this. As a consequence their paintings have a peculiarly flat, depthless appearance. Perspective is lacking. Unless we know what was in the artist's mind we often cannot tell whether the shaky bamboo bridge is supposed to be in front of the cottage, or behind it.

When we see two persons in the distance we usually know that the smaller of the two is farther away, since more distant objects appear smaller. More distant objects also appear hazier as a rule. This is the menace of the fog, whether in ocean or land traffic. It is not so much the obscuring of objects that causes the danger; it is the fact that the vehicle or ship, when seen, appears to be farther away than it really is.

What has this to do with detecting counterfeit bills or grandmother's wooing?

A few years ago it was discovered that small objects, hazy objects, and similar indirect signs were not the principal avenue through which we could tell distance.

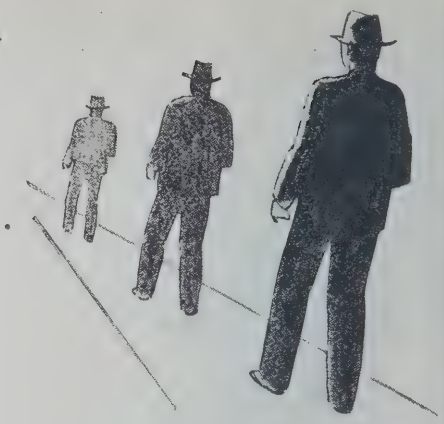
Having two eyes is what makes accurate the perception of depth and distances in our everyday life. The Cyclops, or the person with sight in only one eye, is greatly handicapped.

If you will hold your watch about five inches in front of your eyes, with the edge of the case nearest you, and look at it with only one eye, you will see just the back of the case and the edge nearest you. It looks *flat*. When you use just the other eye you see the face and the near edge. It still looks flat. But when you look at it with both eyes at the same time the watch immediately shows up in its true depth and perspective.

It is marvelous how two different images—one eye seeing the face, the other the back—blend in our head to give the impression of one single object. More marvelous still is the fact that the double image has a quality that neither of the single images possessed—depth, perspective, contour, relief; in short, reality.

All our lives we have been combining two different visual images of everything within our glance to form a single image having the added quality of depth. Every object that comes within our glance gives two different pictures to carry to the brain. Sometimes this difference is slight, sometimes great. In the brain these two disparate pictures are combined to give one. One plus one really gives one.

A household novelty in grandmother's day was the parlor stereoscope. Bible scenes, foreign lands, new industrial processes were pictured in double photographs on a single card which was viewed through the stereoscope. She and grandfather probably spent a good many evenings in the musty parlor looking at these with the aid of a kerosene lamp, which was just becoming a household necessity.



When we see two persons in the distance, the smaller is farther away, since more distant objects appear smaller.

If you will look at some of the cards that are viewed through a stereoscope you will notice that the two pictures are not quite the same. They have been taken by a camera that is really a double camera which takes two pictures at once from slightly different angles. The stereoscope magnifies these slightly, and the brain combines them into one picture which has marked relief.

At a movie in Washington I saw several of grandmother's granddaughters. They were being entertained in a luxurious movie palace rather than in a simple parlor. In the midst of the film fully half of the women in the audience screamed. Some of them jumped out of their seats.

And all over a very simple picture: a small boy was sprinkling a lawn with garden hose!

As we entered the theater a small, paper-mounted pair (*Continued on page 22*)

A household novelty in grandmother's day was the parlor stereoscope.

MR. FORD'S PAGE

OF THE DEARBORN INDEPENDENT

EVERYTHING has been all right, up till now—that is, everything that we thought was all right, but now suspect to be wrong. For to know really that something is wrong we must have thought it right enough to discover that it is not right. When we think a thing is right we embark upon it, give our confidence to it; if it is not right, it lets us down. The thing is, not to repine for having thought it right, for thereby we discovered that it was not. And such discoveries are contributions to the race's permanent knowledge.

This does not mean, as some would say, that each individual must begin at the beginning of all experiences and find out for himself. For one thing, he cannot; he would be dead before he could complete a single experiment. What the race has found out to be wrong, through first thinking it right, is permanently wrong, whether you mean morally or scientifically—they are the same. No wrong thing, discovered to be so by ages of social experience, will be adjudged by a later enlightenment to be right. It is entirely probable that many of the respectabilities of our time will become the shame of a later time, but hardly will any moral shame of today become a moral glory of the future. That is not the way the stream is flowing.

We often speak of the ignorance of the past, but our distant forefathers were no more ignorant than we. They were grinding the grist of experience through the mills of the mind, were discovering by 'trial and error' what was good and what was bad, and were progressing as rapidly as their means permitted in the direction of what they found to be good. And that is all that we are doing. It is the road of wisdom, and those who walked it in antiquity were as sturdy and alert travelers as we. Their discoveries, in the widest sense of human experience, are valid for us today.

What will be known in the future as the ignorance of this present generation is just the residue of discoveries which we shall not have time to make. For the way to one Right is always through preceding Rights. The glory of any generation is to proceed through its full measure of discoveries. And it makes its discoveries by finding that what it thought to be right has not turned out so. The future will never solve its difficulties until we solve ours, for we are all pathmasters on the road of progress, and the farther stretches of the road cannot be made passable until this present stretch is made passable.

What have we formerly thought right which we are now suspecting to be wrong because it is not justifying the confidence we have reposed in it? It would be rewarding for each reader of this Page to pause at that question and make his own answer. We shall not get very far waiting to be told the answer to every question, and besides no single individual can supply the whole answer—it is a social task. Our answers will be in part determined by our special experience in life. The business man will catch one angle, the working man another; the woman will see one aspect clearly, the man another; youth too will have its view as well as maturity.

IT IS easier to denounce the wrongs of the past than to tackle the job of curing present-day defects. Yet the past took care of itself, and there is none but us to take care of the present. Many things the past thought right we are finding out to be wrong; none of the things it found to be thoroughly wrong have we found to be right. Even wrong things have to pass through a period of being thought to be right before they can be known as wrong. When we find out their nature, then responsibility begins. It is this generation's duty to the next to start at once to make room for the right things.

Our fathers thought that life was hard, but we are beginning to see how preventable some of its hardships are. We have come to the point of believing that there is absolutely no necessity for economic distress in a world so richly furnished with supply. Men are searching with sharp and accusing eyes the defect in our system which prevents a man from working when he wants to work and his responsibilities require it. What is wrong? When a conduit does not convey the water, we look for the stoppage. Economic stoppage is not natural; this defect is not in the created world of things. It is in the human world—our selfishness, our lack of wisdom has created it. If we have established a money system which can be manipulated to the hurt of multitudes, and can trace it back to the system, it is certain as fate that the system is doomed; the very discovery of its insufficiency is its death warrant.

People think that everything will be rectified when war is abolished. Well, let no argument interfere with the abolition of war—it is one of the things men used to think was right, and they thought it was right long enough to discover that it was wrong; but logic whispers this insistence, that war will not be abolished until its roots are cut. And one of its tap roots is a false money system and the high priests thereof. It is not that people love the land they live in, it is not that human nature will die in defense of its dearest—these are not the things that make war; to make men landless and cowards will not bring peace. But it is the false doctrine fostered by the few that war spells gain—it is this that makes war, and there is a great dearth of pacifists who see and attack it. *The fact that pacifists are left in peace is proof that they are not attacking the real causes of war.*

Our responsibility is not to create a perfect world, but to establish *our* discoveries of what is right, by weeding out what *we* have newly discovered to be wrong, and leaving to the future its tasks of the same nature.

QUITE naturally the Baumes Law is not popular with New York's criminal element. It deprives them of rather large slices of their liberty. And quite as naturally it is not popular with the state's professional sob sisters, male and female. They view with horror any and all attempts to punish the wrongdoer, and *making punishment mandatory* passes almost beyond their comprehension. But the law is popular with the people as a whole. It is popular with those charged with protecting life and property. It is popular with the highest courts in the state, which have upheld its legality. Crime in New York City, according to the report of the Commissioner of Police, was cut sixty per cent during 1926! The decrease was attributed directly to the Baumes Law, which was in effect only for six months during that year. The Baumes Law has many commendable features: it decrees high bail; it removes the power of discretionary sentence from politico judges; it makes prison inevitable for perpetual criminals. Undoubtedly it is harsh; but so, too, is crime harsh, and there is an old truism that fire must be fought with fire. If harshness to the criminal has reduced crime sixty per cent in one state, it might well be tried in others.

A 'Gift' to the Taxpayers

THE $400,000 a year loss which the Rothschilds of London and the Belmonts of New York have been sustaining on their unfortunate Cape Cod Canal venture will soon be a thing of the past—for them. Henceforth the burden will be borne by the taxpayers of the United States. But this is not all of the good news. Besides ridding themselves of their notorious 'dead horse,' the Rothschilds and the Belmonts are actually to receive $11,500,000 from the Government for doing so! It is one of the neatest deals slipped through Congress in a long time.

Twenty years ago certain bankers thought they saw a bonanza in a canal cut across the base of the Cape, which would take sixty-five miles and four hours' sailing time from the Boston-to-New-York sea route. True to instinct, the Rothschilds and the Belmonts organized the Cape Cod Construction Company, which built the canal, accepting payment of $6,000,000 in bonds and $6,000,000 in stock of the Cape Cod Canal Company, which they organized to operate it. The financiers made a profit from the construction, but the canal itself was a flat failure. Too small for vessels of large draft, it came in time to be used principally by coal barges.

Agitation for Government purchase began almost as soon as it was discovered that the canal was a financial Jonah. As a temporary war measure the Government took it over in 1918, and lost $900,000 during the twenty months of federal operation. Propaganda for Government purchase has been active since the return of the canal to its private owners. Repeated efforts were made to slip the purchase past Congress as a separate piece of legislation. These failed, but at last the deal has been accomplished as part of the Rivers and Harbors Bill.

Not the least interesting feature of the transaction is that under Government ownership all tolls are to be abolished. Nearly two-thirds of the income of the canal under private operation was derived from one concern, the Eastern Steamship Company, of Boston. This firm, Senator Howell estimates, will save approximately $280,000 in tolls as a result of the purchase. That sum will now be paid by the taxpayers of the nation. And the total annual deficit which must be met by the taxpayers is estimated by Senator Howell at $850,000.

The Burden

THESE figures, tabulated by Roger Babson, demand attention. They show the percentage of net profits paid out in taxes by the different great occupations:

	State Taxes per cent	*Federal Taxes per cent*	*Total Taxes per cent*
Agricultural and related industries	64	19	83
Mining and quarrying	44	16	60
Transportation and public utilities	28	8	36
Construction	17	15	32
Finance, banking, insurance	22	9	31
Wholesale and retail trade	15	12	27
Manufacturing as a whole	14	10	24

Such a burden as that borne by agriculture is obviously unfair. The inefficiency of agriculture can be stressed to the limit, but in the final analysis no industry can be truly prosperous which bears such a disproportionate share of the nation's taxation. Forty million persons comprise the farming population of the nation, and these forty millions are vital to the prosperity of the nation. Yet they—and their purchasing power—are being taxed to death *by* the nation. Blundering taxation is one of the most serious problems confronting the country today.

Nicaragua

PRESIDENT COOLIDGE'S case in favor of intervention in Nicaragua is almost as good as the case against it, which means that many will not consider it good enough. The picture that has secured firm lodgment in the American mind is this: the Mexican hook has been baited with the Nicaraguan worm, and the United States Government has swallowed it. The forces that have used every effort to embroil the United States with Mexico, through oil or religion or what not, have proceeded indirectly—they are leading us into Mexico via Nicaragua. Not even the President obscures the point that in Nicaragua we are fighting Mexico, for he charges that Mexico is the force behind the Government which the United States does not choose to recognize. This picture of our country refusing to go to Mexico direct because of American public opinion, but being led indirectly by way of Nicaragua because of a less enlightened public opinion with reference to that country, is one that is firmly fixed in the American mind, and it will require some effort to expunge it.

What we are now embarked upon has every element of war except a formidable opponent. It is not called war because the opponent is too feeble to fight us. And it is entirely satisfactory to those who have been endeavoring for years to start bloodshed between Mexico and this country. That fact alone has enough significance to give our people a hunch.

It is commonly reported throughout certain circles in the country that the Nicaraguan policy of the United States is, whether consciously or not, the policy of the oil interests, and that if public opinion continues to prevent intervention in Mexico the same result can be obtained in other ways. These are sayings which no action of our Government should ever justify. It will be increasingly difficult to veil the facts under general statements about 'the protection of American lives and property.' A list of these lives and the property interests would give the American people a view of this matter that they are justified in having.

When the President bases so weighty a policy on the fact or the assumption that Mexican arms have been found in Nicaragua, he uses a device which past diplomacy has rendered extremely questionable in view of the ease with which evidence of that sort can be manufactured. Moreover, he leaves it open for Mexico to report that the weapons which arm rising revolutionists all over Mexico today are from the United States.

Kidnapped?

WE ARE glad that Aimee Semple McPherson is off the first page and out of the courts. The case had the same suggestion of persecution as surrounded that of Mrs. Hall of New Jersey. Mrs. McPherson's case, however, seemed to be aggravated by the fact that she was a religious teacher, which fact seemed to give all alienism *carte blanche* to run a stream of filthy innuendo through the movies and magazines of the country. The American press was not reluctant to damn in advance a woman against whom nothing had been proved; it showed its usual fairness by printing obscurely and with shameful brevity the acquittal of one it had pronounced guilty in its first-page scare heads. When will the American press take to itself at least as much fairness and dignity as a country justice court?

There is now no way of judging the matter of Mrs. McPherson. Maybe she was kidnapped; maybe she wasn't. Women who go in for the highly emotional life of religious leadership usually do queer things. Sometimes they abjure matrimony for mystical spouses, sometimes they acquire too much earthly matrimony so that the names of all their spouses make an imposing array; always they have strange experiences of one sort or another. It is probably founded in The Nature of Things that priests and apostles are males. The 'women religions' are usually tinged with queerness.

The pressure and strain of religious leadership such as Mrs. McPherson had undertaken, the excessive drains upon her sympathies and creative energies, the false assumption that the sacredness of the labor nullifies the fatigue of the body, all undoubtedly combined to create a condition which made a vacation, if not a kidnapping, desirable.

Maybe she was kidnapped. If so, it was undoubtedly a good thing for her. There are many men living under killing strains today whose physicians would like to kidnap them, take them hundreds of miles away and make them walk home—it would be their physical salvation.

Boarding at the Church

BUILDERS of a new skyscraper church in Chicago are planning their structure to fulfill one of the city's important needs. Besides the church auditorium and the usual departmental rooms, the eighteen-story building is to contain living quarters for six hundred young men and women. Rooms for recreational purposes and a swimming pool will be provided. Attention will be paid the social as well as the religious life of the residents. The idea back of the project may not be new, but it is assuredly sound. In every large city in the country are thousands of young people, newly from rural communities, who find that metropolitan life presents many serious problems. They have, as a rule, keen ambition but meager capital. They form a vast potential asset to the city, but their path, for the first few years at least, is beset with many difficulties. Cut off from friends and home influence for the first time, they find themselves without healthful social contact at a period when they need it most. Any agency that can aid them in adjusting themselves to their new environment is helping not only the young people but the community in which they live. The Chicago experiment may point a way of practical service to other churches.

Contrast the disagreeable feeling you have when you are part of a great crowd with the feeling you have when you go hunting or fishing in the woods.

Going After a GOOD TIME *and* MISSING IT

By THOMAS L. MASSON

Illustrated by RUSSELL LEGGE

THE manager of one of the largest amusement parks in the United States told me that the owner of the park, where on Saturdays and holidays thousands of people congregated, never went near the park on these days. When asked why, he said he couldn't afford it.

'When I first began going to the park on big days,' he continued, 'I noticed that my visit was invariably succeeded by a fit of depression. I began to make a study of the people and the conditions, and then I saw quite plainly that the crowd came there to get rid of their troubles. The attendance just before or on the first of the month was always less than on other big days. This was because it was so near rent day, and thus a large proportion were brought too close to stern reality.

'You may laugh and think me a nut, but long experience has convinced me that large bodies of people who congregate in one place to forget themselves throw off clouds of low-pressure fear. You know how you can often feel the presence of others when you can't even see them. It's that way. You may not think it (he was a heavy-set, hard-boiled-appearing man) but I'm sensitive to these things, and I advise any man who is like myself to keep away from large bodies of people who are at least trying to have a good time.'

I don't think there is any doubt that people carry atmospheres around with them. The elder Rothschild said he made his large fortune by always associating with lucky people.

Contrast the disagreeable feeling you have when you are part of a great crowd with the feeling you have when you go hunting or fishing in the woods. Not only do you enjoy yourself every moment, but for long after the memory of it sustains you.

Also, have you ever stopped to think that the premeditated good time so rarely comes off according to schedule, while the really good time comes oddly, unexpectedly? One night I came home so tired I could scarcely drag one foot after the other. My wife announced, 'We are going to a party.' I howled like a wolf, I fought like a wild man. She had to drag me into my clothes by main force. And I had the time of my life. The next day I did twice as much work as usual.

Do you know why the big men of this world are so big, why they get so much done? It is because they treat work as incidental. They never miss an opportunity. I used to work with one of the biggest men in this country. Every once in a while he would run into my office and exclaim: 'Come on! Let's violate all the rules.'

I knew what that meant. It meant dropping everything and going to the country or to a play—anything to have some fun. Some time I would have to come back and work until midnight to catch up. What of it?

Understand, I am not here advocating disorder, anarchy, laziness. I am advocating just the contrary. Believe me when I say, the big men are always casual. To be casual is to be powerful—always! (When you have a fair amount of brains.)

Why is it that people take so much trouble to have a good time, go through the most devastating drudgery beforehand, only to fail? Because that is the only way they know, poor mortals. Most of them go round all the time tied up in a hard knot. Keep unraveling yourself. It's the great necessity.

Anything pays big returns which gives us release from deadly monotony, because it lifts us up on the higher level of joy, and in this condition we eat up work.

What seems drudgery in a low-pressure state is a joy in a higher state. I am typewriting this article with my own hands to the music of ten-ton trucks. If I wait until tonight it would be a dead weight. I have just come back from a vacation. It lasted three hours, I went out and looked at the world. (Did you ever take a good look at it? Quite a movie!)

Too many people pass half their lives trying to have a good time and the rest of their lives regretting that the good times planned didn't come off.

Merely because one-half or three-fourths of the pleasure we get out of a good time lies in the anticipation is no reason why we should accept this as being right.

Also, too many people nourish the secret idea that

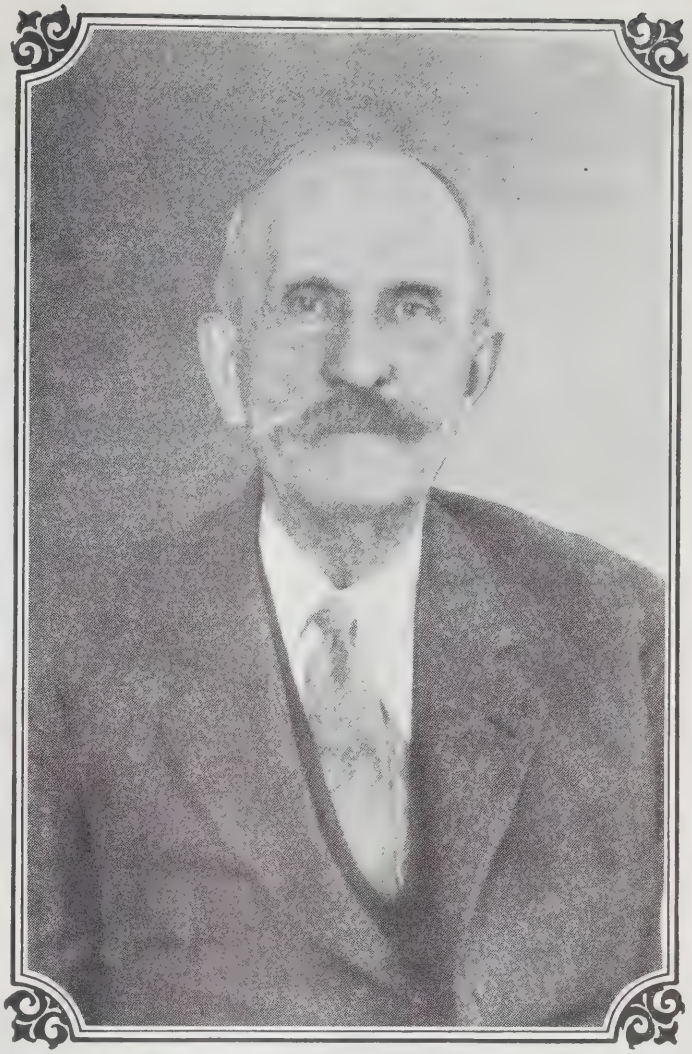
STRANGE MEN *Who Could Not* Keep Straight

By GEORGE HENRY PARISH

PART I



FREMONT OLDER, editor of the San Francisco 'Call' and dean of San Francisco journalism, has known most of the remarkable criminals that have appeared in California during the past forty years. In this issue is begun the narration of his recollections of some of these strange men. They are still 'strange men' to Mr. Older. He does not pretend to know why they act as they do. They seem, he says, to have been born differently. But he sees the good in them as well as the bad, and feeling that they are not entirely responsible for what they are he is in favor of treating them with all possible kindness while they are under restraint. Mr. Older's views have moderated, directly or indirectly, the rules of all the great prisons of America.

THE strangest man that Fremont Older ever knew was Charles Augustus Boggs. After dark one night Boggs suddenly walked into the kitchen of Older's house which is situated halfway up a wild mountainside, fifty miles south of San Francisco. Mr. and Mrs. Older were not at home. Two or three former convicts whom Older had employed were in the kitchen. Boggs said he had walked eleven miles from San Jose, was tired as a dog and had not had anything to eat for three days. He said he knew Older would give him a meal and let him stay all night.

One of the men said to Boggs: 'Of course Older will give you a meal and let you stay all night. He isn't here but we will cook it for you.'

Boggs waved them aside.

'Let me cook my own dinner,' he said. 'I am a professional cook.'

Boggs built a fire, prepared a fine dinner for himself, ate like a wolf and when Mrs. Older came home she sent him to stay all night with the other former prisoners in the old farmhouse on the ranch.

Boggs was up bright and early the next morning. After breakfast he told Mrs. Older that he would like to do some work to pay for his two meals and his night's lodging. Mrs. Older asked him what he could do.

'I am a locomotive engineer by profession,' he replied.

Mrs. Older, having no locomotives to operate or repair, hesitated a moment. Finally she said that she had nothing but gardening to do.

'I am a gardener by profession,' said Boggs. .

Mrs. Older told him to make some flower beds and pointed out the place where she wanted them made. Boggs worked awhile and then came back to the house. He wanted to know whether Mrs. Older wanted the flower beds shaped like stars or hearts. He had made both kinds and Mrs. Older was astonished to see that they were really beautiful. Boggs, plainly enough, during some of his prison experiences, had worked at landscape gardening. But she did not happen to care for hearts or stars and Boggs made them all over again, just as she wanted them. Mrs. Older was so elated that she offered Boggs a steady job at good wages which he accepted.

A few days later, a yearling steer broke its leg. None of the old employes knew what to do. They asked Older and he was no wiser. Older happened to mention the matter in the presence of Boggs.

'Leave it to me,' said Boggs. 'I am a butcher by profession.'

Boggs killed the steer, dressed it as quickly and expertly as if he had been killing steers all his life, hung it up on a hook and called Older to look at what he had done in an hour or so.

Older was pleased, but another problem entered his mind. If the carcass were left outdoors all night the coyotes would get it. Older suggested that Boggs hitch up the horses and take the beef to the farmhouse, which was perhaps 200 yards distant.

'That will not be necessary,' said Boggs. 'I am a professional athlete. I will carry the steer to the farmhouse.'

Boggs was five feet six inches in height. The steer weighed 240 pounds. Boggs put the steer on his back and started off on a trot.

There is always trouble of some kind on a ranch. In a few days there was need of a plumber at the house, and the nearest plumber was miles away.

'By profession,' said Boggs, 'I am a plumber. Pay no more attention to this matter. I will attend to it.'

And he did—easily, skilfully and quickly.

The first heavy fall rain came a few days later and the torrent of water that came down the mountainside endangered the foundation of the house. By that time the Olders had learned to turn to Boggs in times of trouble and they sent to the farmhouse for him.

'A very small matter,' said Boggs. 'By profession I am a cement worker. I shall have no difficulty in fixing this.'

The cement drain that he laid is there yet, in as good condition as it was when he made it.

Somebody left a window open upstairs, rain blew in, trickled down through the floor and made a bad spot on the ceiling of the dining room. Mrs. Older wondered if Boggs knew anything about painting.

'By profession,' he replied, 'I am a painter and decorator. Four years' experience.'

Boggs bought some paint, mixed it and caught the shade so closely that when the spot on the ceiling was covered nobody could tell where it had been.

On the ranch were a number of cows. One became ill. Boggs was summoned.

'By profession I am a veterinary,' he said. 'The cow will soon be well.'

It was well in three days.

AFTER the family had retired on Christmas Eve one of the dogs set up a fierce barking. The barking indicated that somebody was in front of the house. The dog was right as the Olders learned the next morning. Boggs had been decorating while his employers slept. The words 'Merry Christmas' had been worked out in red berries, surrounded with garlands of green gathered from the mountainside and flung across the front of the house.

The Olders, when they beheld what he had done, were not only dumbfounded but elated. Knowing that nobody but Boggs could have wrought such a bit of art they sent to the farmhouse for him. When he came they thanked him and told him how wonderful it was that he should have been able to make so beautiful a thing out of scraps from the forest.

'Not at all difficult,' replied Boggs. 'By profession I am a wood-carver.'

All of these things happened within six weeks. The Olders were so delighted that they would have been glad to keep Boggs always. But they knew they couldn't. In a few days Boggs told Mrs. Older that he never stayed more than two months in a place and that his time at the Older ranch was up. He explained that the only reason he came to the ranch was to grow a beard so that women would not pursue him. His pet complex was that his charms were well-nigh irresistible. Having a two months' stubble on his face he felt safe to go back to the city; and he went.

Two weeks later, Boggs was in jail in San Jose for marrying a young woman for the purpose of swindling her. He had met her through a matrimonial agency. A lawyer got him off, but in a little while he was in jail, on a very serious charge, in Lodi, California. He wrote to Older for help, but nobody could help him and Older so wrote him. Older has not since heard from him but believes he is in prison somewhere.

A GOOD man spoiled because of a kink in the brain that he did not make! A man who would have been good for many things if he had not been so weak.

Jack Black was not weak. In 1906, he was convicted of highway robbery and sentenced to prison for twenty-five years. While his case was up for a hearing on petition for appeal, San Francisco was burned and all of the records in the Black case were destroyed. Without the records, the court could not well go on with the appeal; so Black stayed in jail with his appeal unheard. He had been in jail seven years when Older heard about him and went to the jail to see him.

Older asked Black what he could do for him. Black told him he could do nothing, that his case was hopeless. Older said he could at least go to the judge who sentenced him to twenty-five years' imprisonment and ask him to parole him. The judge told Older he would consider the matter.

BLACK construed this to be equivalent to a denial and at once broke out of jail. He was captured again in a few weeks and brought back to San Francisco. About this time, Older received word from the judge that if Black would withdraw his appeal and plead guilty, his twenty-five years' sentence would be reduced to a year or two. Black withdrew his appeal, was given a sentence of a year and in ten months was discharged.

When Black got out he was in bad shape—emaciated, run down, almost a physical wreck. Older took him to his ranch to build him up and kept him there several months. Black soon became a favorite with everybody in the household. He had a sense of humor and could even joke about his past. Asked by Mrs. Older to walk across the floors of the new house they were building and give her his opinion, 'as an expert burglar,' whether the floors would squeak, Black replied:

'I could not tell you for certain unless I were to walk across them at two o'clock in the morning in my stockinged feet. There are squeaks at two in the morning that cannot be heard at any other time.'

Told that he had been 'a hero' the night before during a storm that blew out a window, he replied: 'The night is my time, you know.'

ONE afternoon Older's dogs began to bark furiously. Older and Black went out on the porch to see who was coming. An automobile was toiling up the mountain road. Older could not make out the occupants, but after a while Black could.

'It's the doctor,' he said with joy.

The 'doctor,' it appears, was an old prison pal of Black's. After he left, Black told Older the doctor's story.

The man was an old-time burglar. After having served three sentences, he resumed his old trade and was caught again. The district attorney advised the prisoner to plead guilty and make things easy for himself. In that event, the judge might let him off with five years on daylight burglary, as the prisoner was arrested before sunset. Otherwise, said the district attorney, the judge would be angry, construe the case as night burglary, and impose a sentence of fifteen years.

THE prisoner pleaded guilty, said Black, and the lawyer at once arose and asked for a five-year sentence on the ground that the burglary was committed by daylight.

The judge took offense at the suggestion, consulted an almanac and said the man had been arrested five minutes after sunset and was therefore guilty of burglary in the nighttime.

The district attorney tried again to keep faith with the prisoner.

'This man,' he said, 'may have been arrested five minutes after sunset, but the crime had been committed some time before that. He had left the house he had robbed and walked several blocks before he was arrested.'

The judge told the district attorney to sit down, and imposed a sentence of fifteen years.

The district attorney waited a moment until the court stenographer had finished taking down the words of the court, and then said:

'Your words now being on record and it being a felony to alter the record, I wish to call your attention to the fact that you forgot to arraign this man.'

The judge saw he was in a jam, but he was too angry to accept the district attorney's offer to impose a five-year sentence and let the matter drop. Instead, he sent the prisoner back to the county jail. After he had been there a year he was released because of a provision of the law which permitted the release of a prisoner under sentence a year without judgment in the case having been entered.

This was such a close squeak that the burglar reformed, studied medicine, graduated, married, and now has a practice that brings him in from $5,000 to $6,000 a year. He has gone straight ever since. Older believes much of the credit is due to the doctor's wife.

And Black has gone straight. It is nearly ten years since Older picked him up as a brand from the burning, but he has never gone back to his old ways. Older got him a job in San Francisco that he holds as steadily as if he had never known what it meant to stick a gun under a man's nose and demand his money. Black says the thing that reformed him was Older's success in getting a twenty-five-year sentence reduced to ten months. It then seemed worth while to try to start life anew.

MR. OLDER'S readiness to extend a helping hand to former prisoners causes him, once in a while, to be imposed upon, but such incidents never shake his faith in the fundamental goodness of mankind.

A young man who introduced himself as 'Mr. Pedro' once called upon Mr. Older at his (*Continued on page 2*

EDITOR'S NOTE: We do not believe that the United States is so angelic, nor other nations so blameworthy, as this comparison would indicate. Were it written by an American in national self-praise, we could not justify its publication. It is written by a born British citizen of wide experience, and differs so widely from general foreign opinion of the United States, that we feel justified, if only by the novelty of the criticism, in publishing it.

The Charge *Is*—'MATERIALISM'

By THOMAS CAMERON TAYLOR

'This charge of materialism will not down. It is a fetish with old-world critics, the one thing upon which they all agree.'—THE DEARBORN INDEPENDENT

But the Records in the Case Show THAT—

The Accused Nation—America:	*The Accuser Nations—Our Friends Abroad:*
Has never fought one war of aggression; has taken the field only when the vital principle of human liberty was at stake; and has in its own life vindicated that principle at great cost.	Have armed and set people against people, slaughtering for territorial advantage, for trade routes, for commercial gain, for military control, for dynastic aggrandizement, and so forth.
Has called together the powers to reduce armaments and seek peace.	Have stultified reduction of armaments by retaining in strength the forces which best suit their purposes.
Has cut down its armed forces to limits which—on the basis of its territorial necessities and its obligations under the Monroe Doctrine to avert outside aggression from the American Continent in its less-developed elements—approach a state of comparative weakness, in the opinion of many.	Have built up in jealous watchfulness of each other powerful fighting forces and scientific war equipment of the most dreadful character, and glorified the power to destroy.
Has saved in one foreign land alone eleven million human beings from death by starvation, when 'idealists' brought the land to ruin. Has poured out effort and treasure without limit to gather up the remnants of peoples in the Old World who had been passed under the harrows of persecution and war.	Have murdered in one land alone more than a million people for an 'ideal,' brought a great nation low with famine and grim lawlessness; crushed, and parceled out, and erased peoples among the oldest in Christendom.
Has in the Pacific alone, through its whaling seamen, discovered, used, and named more than four hundred islands, and of these has claimed practically none.	Have founded claims to territory on the slightest of pretexts, and waged war in support of these claims.
Has in 150 years brought to life a whole continent, lifting up all its people by freedom of education, freedom of religion, opportunity for *all* to reach up to any height they may prove fit to occupy.	Have laid huge territories in black ruin, and tolerated the unexampled luxury of the few built upon the unparalleled misery of the mass of humankind; has in some instances confined education to the few and left the mass of the people in the slavery of ignorance.
Has encouraged the development of the individual, fostered and even forced the spread of knowledge, and given to intelligence a practical orientation for the benefit of all.	Have maintained systems of caste which artificially project the few into permanent power, and deliberately keep millions in the position of rats in a drainpipe.
Has regarded a thinking, intelligent human being, independent in his personal resources, clean in his outlook, and strong to go forward, as the finest product of the nation.	Have acquiesced in and maintained doctrines which have made beasts sacred and made the masses less than beasts—that *untouchability* which insures mass degradation, regardless of who may be their conquerer of the moment.
Has led in and wrought the emancipation of womanhood—*all* its womanhood.	Have kept women in the chains of lowest mental and even personal slavery, selling children in marriage, denying to women—we refer to *suttee*—any place in life apart from their 'lords.'
Has fought, as a whole people, with courage and intelligence, against everything that	Have accepted, generation after generation, in blind or indifferent helplessness or worse, the

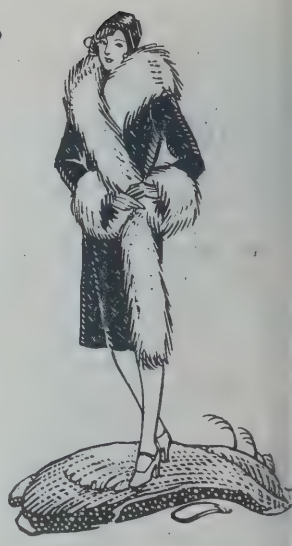
And So There Were Young People

'Going to Ye Doggs'

In Those Good Old Days

By KATHARINE METCALF ROOF

Illustrated by RUTH THURBER



ARE you concerned, oh 20th Century parent, about the abbreviated skirt, nonexistent sleeve, intensive lingerie, or one-piece bathing suit of your daughter? Then hark to the denunciations of the simple Cobbler of Agawam—who was not a cobbler at all, but a parson—against frivolous femininity in the town of Essex, Massachusetts, in the Year of Grace 1645.

. . . 'I shall therefore misspend a word or two upon their long-waisted, short-skirted patience: a little of my stirrup will do no harm . . . When I hear a *nugiperous* gentledame inquire what dress the queen is in this week, what *nudistertian* fashion of the court—I mean at its very newest, with egg to be in it in all haste, whatever it be—I look upon her as the very *gizzard* of a trifle, the product of a quarter of a cipher, the epitome of nothing, fitter to be kicked, were she of a kickable substance,—than either honored or humored.'

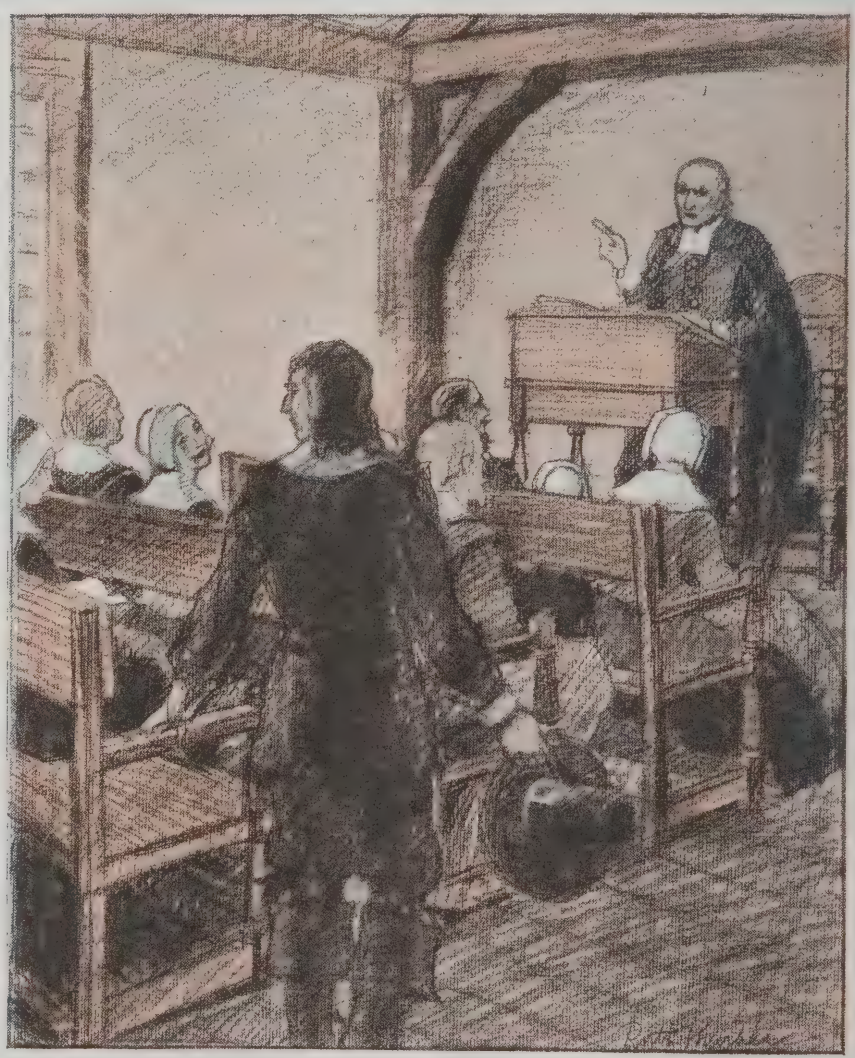
Much anathema has been hurled at your inconsequent bobbed head, oh flapper of 1926, but at least no one has ventured to call you 'nugiperous,' 'the gizzard of a trifle, a quarter of a cipher, an epitome of nothing,' and what, one wonders, is a 'nudistertian fashion'? Is it in any way synonymous with the near-nudity of today?

'To speak moderately,' the Cobbler continues, 'I truly confess it is beyond the ken of my understanding, to concieve how these women should have any grace or valuable virtue that have so little wit as to disfigure themselves with such exotic garbs as not only dismantles their native lovely luster, but *transclouts* them into *gant bargeese*, ill-shapen-shotten shell fish, Egyptian hieroglyphics, or, at the best, into French *flurts of pastry*, which a proper English woman should scorn with her heels. It is no marvel they wear drails on the hinder part of their heads, having nothing, as it seems, in the forepart but a few squirrels brains to help them frisk from one ill favored fashion to another.'

It will be seen that the Cobbler wielded a strong and picturesque pen in the demolition of female folly.

'I can make myself sick at any time,' he continues, 'with comparing the dazzling splendor wherewith our gentlewomen were embellished *in some former habits*, with the gut-foundered goosedom wherewith they are now surcingled and debauched. (Note the recurrent theme of the good old days. We have about five or six of them in our colony,' he announces, descending into innuendo. 'If I see any of them accidentally I cannot cleanse my fancy of them for a month . . . I have often heard diverse ladies vent loud feminine complaints of the wearisome varieties and chargeable changes of fashion. I marvel themselves prefer not a bill of redress. Would Essex ladies would lead the chorus for the honor of the county and their persons.'

Then lest hi



In 1700, a clergyman reproved from the pulpit a young man in striking new garments, who had come in during prayer time to attract the greater notice of the congregation.

'Sally won't go to church nor to school,' Madame Coleman writes helplessly, 'and wants a nue muff and a great many other things she don't need.'

giddy feminine parishioners should be moved to take his grim wit too lightly, he warns them: 'If any man think I have spoken rather merrily than seriously he is mistaken. I have written with all the indignation I can, and no more than I ought . . .' Yet he concedes a little farther on, 'I point my pen only against the light-heeled beagles that lead the chase so fast they run all civility out of breath against those ape-headed pullets which invent antique fool-fangles merely for fashion and novelty's sake.' He passes on to pity the husbands of these extravagant daughters of Eve. 'It is beyond my account how many gentlemen's and citizens' estates are deplumed by their feather-headed wives . . . If the parliament would please to mend women—which their husbands dare not do—there need not be so many men to make and mend as there are.' (Compare with editorials on extravagant young wives of today who plunge their husbands into bankruptcy and ruin.)

Yet he could appreciate gifted womanhood when he found it, even vision the future achievements of woman at a time when, outside the home, she was universally regarded as a cipher—if not the fraction of one. Witness these lines concerning Anne Bradstreet, the first Puritan poetess, describing the perplexity of the gods as they marvel over her prowess.

'Good sooth,' quoth the old Don, 'tell me ye so,
I muse at length whither these girls will go.
It half revives my chill frost-bitten blood,
To see a woman once do ought that's good.
And chode by Chaucer's boots and Homer's furs,
Let men look to it, lest women wear the spurs!'

In Governor Winthrop's journal of the same period we find disturbed questionings as to whether women should wear veils, and learn that there were orders of the court forbidding 'short sleeves whereby the *nakedness of the arms* may be discovered.' Women were also complained of because of their wearing 'immodest borders of hair, and their cutting, curling and laying out of their hair,—especially among the younger sort.'

In 1683 Increase Mather gave them a broadside on the subject. 'Will not the haughty daughters of Zion refrain their pride in apparell? Will they lay out their hair (this gesture seems to have been particularly painful to the clerical sensibilities), wear their false locks (transformation of 1683!) their borders and towers, like comets about their heads?' 'Apes of fancy,' they were also called, 'friziling and curlying of their hayr.' So it appears that hair was a sore point three hundred years before the bob made its appearance. Masculine wigs were also regarded as artifices of the devil.

Two joyous youths were caught driving through a town during the hours of service.

Apostle Eliot sadly remarks that 'the lust for wigs is become insuperable.' 'Horrid bushes of vanity,' another called them, and Judge Sewall in his diary relates how he pursued a friend's son, young Joshua Willard, to the wall. 'I enquired of him what extremity had forced him to put off his own Hair and put on a Wigg. He answered none at all. But said that his hair was streight, and that it parted behinde. Seemed to argue that men might as well shave their hair off their heads as off their face . . . seemed to say he would leave off his Wigg when his hair was grown.'

It is reassuring to learn that men were almost equally reprehensible in their weakness for finery. In 1651 the General Court expresses its 'utter detestation and dislike that men or women of meane condition, education and callings, should take upon them the garbe of gentlemen by the wearinge of gold or silver lace or buttons, or poynts at their knees, or to walke in great boots, or women of the same rank to wear silke or tiffany hoodes or scarfes.' Indeed, Alice Morse Earle remarks, 'Walking in great boots proved alluring to an illegal degree just as did the wearing of silk and tiffany hoods. Many persons were presented (in court) under this law.'

But it was the inferior sex that proved most disturbing to their spiritual masters. Not only were their arms, so we are told, bared to an immodest degree, but their necks as well, calling forth 'just and seasonable reprehension of naked breasts.' Dire prophecies of retribution were

hurled at the heads of the poor Puritan ladies who, to the distorted vision of their censors, 'walked with outstretched necks and wanton eyes, mincing as they go.'

The sudden growth of the colony in wealth after the first years of bitter struggle and privation brought an increase of these vanities. The ascetic preachers were apparently powerless against the tide. In 1686 we read of at least one painted face in Boston society. 'To hide her age she paints, and to hide her painting dares hardly laugh.' We read of advertisements for cosmetics of all sorts at that period: 'An Excellent Wash which softens and beautifies the Skin to Admiration,' also 'a composition to take off *Superficious* Hair.'

As for feminine rebellion, consider Miss Hannah Lyman of Northampton, aged sixteen, who was one of thirty-eight women brought before the court in 1676 for their 'wicked apparell.' Hannah we find accused of 'wearing silk in a flaunting manner, in an offensive way and garb, not only before, but when she stood presented.'

The clergymen of early New England could give lessons to our informal modernistic ministers who are sometimes criticized by conservative parishioners today. Rev. Mr. Moody, in 1700, reproved from the pulpit a young man in striking new garments, who had come in during prayer time to attract the greater notice of the congregation. 'And, oh Lord, we pray thee cure Ned Ingraham of that ungodly strut,' he improvised. Another time he prayed for a member of the erring sex, ending thus, 'She asked me not to pray for her in public, but I told her I would, and so I have. Amen.'

One of the most priceless of all these impromptu prayers is one voiced by the Reverend Mr. Miles in a time of drought, in which, apparently apprehensive of divine misunderstanding, he gives definite instructions to the Almighty:

'Oh Lord, Thou knowest we do not want

'My maide servant hath got such a head that her carriage toward myself is unsufferable.'

Thee to send us a rain which shall pour down in fury, and swell our streams and carry away haycocks, fences, bridges. But Lord, we want it to come drizzle-drozzle, drizzle-drozzle for about a week. Amen.'

History does not record whether the Lord followed instructions.

But 'exotic garb' and up-to-the-minute clergymen were not all the modernities of 17th Century Puritanism. Oh mother, oppressed by a sense of distraught futility when you tell your daughter to do this and she does that, read of the outrageous behavior of Mistress Sarah Hull of Barbadoes, who came north to school, to be a thorn in the flesh of her Grandmother Coleman in Boston. She arrived with her maid in 1719, and a few days later scandalized her grandmother by leaving the house and engaging board and lodging at a neighboring house. At her brother's command she finally returned, but continued in all other respects to go her own wilful way.

'Sally won't go to church nor to school,' Madame Coleman writes helplessly, 'and wants a nue muff and a great many other things she don't need. I tell her fine things are cheaper in Barbadoes. She says she will go to Barbadoes in the Spring. She is well and brisk, says her brother has nothing to do with her as long as her father is alive.'

Grandmother Coleman further records that Sally's bill for dancing lessons is five pounds for two months. Did Sally go to the dogs, the destination—or a worse one—unquestionably predicted for her? No, she grew up to become a popular society belle, and in time, doubtless, an exemplary wife and mother.

The rigors of early Puritanism began to weaken with the rising generation. We read in Judge Sewall's diary that on January 7, 1719, 'The Governor has a ball at his own House that lasts to 3 in the Morn.' Indeed there was a dancing master in their midst in 1685. By 1720 New England children were quite generally learning to dance with the consent of their parents. However, we discover a remnant of the true Puritan attitude toward this diversion as late as the Revolution, when Colonel Mitchell, a former magistrate, reproves a giddy young thing who has forgotten her turn in the country dance while chatting with a younger admirer. 'Give over, Miss, give over. Mind what you are about. Do you think you come here *for your pleasure?*'

Turning the old pages we come upon more and more records of rebellious youth. We imagine that whatever else it might avoid, there was no escaping the regular attendance at 'meeting,' with its intolerably long sermons; but again we read of two joyous youths caught driving through a town during the hours of service by the tirelessly 'snoopy' tithing man who stopped them, of course. 'My grandmother is lying dead in the next town.' Thus one mournfully excused himself, but after he had been allowed to drive on, he stood up in his wagon and shouted impudently from a safe distance, 'And she's been lying dead in the graveyard there for thirty years!'

Not only youths were bold upon sacred

It seems, too, that 'wretched' boys, sons of Belial, whittled in meeting and cut the woodwork and benches.

occasions. We read at a very early date of the 17th Century flapperishness of one Tabatha Morgus of Norwich, 'wich did . . . prophane ye Lordes day in ye meeting house of ye west society, in ye time of ye forenoone service, by her rude and Indecent Behaviour in Laughing and Playing in ye time of ye Service.'

At a later date one Deborah Bangs paid a fine of five shillings 'for Larfing in the Wareham Meeting House in time of Public Worship.' At the same time a boy for the same offense paid ten shillings. 'He may have laughed louder and longer,' observes Mrs. Earle, who tells the story. It seems, too, that 'wretched boys, sons of Belial whittled in meeting and cut the woodwork and benches.'

It is not wholly without satisfaction that we read of certain individualistic Quakers who invaded the Puritan meetinghouses, and after having listened, as they felt, sufficiently, arose crying out, 'Parson, thy sermon is too long,' 'Parson, sit down, thee has already said more than thee knows how to say well.'

A QUAINT custom of that period that continued for a century later was the bride's privilege of choosing the text for her wedding ceremony. Abigail Adams, courageous, wise and witty wife of our second President, who married her husband against the wishes of her parents, chose this text for her wedding sermon: 'John came neither eating bread nor drinking wine and ye say that he hath a devil.'

Well, you have decided that if there were flighty daughters then as now, at least domestic servants were biddable if not browbeaten creatures who toiled without question. Listen to the sad tale of young Mary Dudley, Governor Winthrop's newly wed daughter, as recounted in a piteous letter to her mother in April, 1683.

'I thought it convenient to acquaint you and my father what a great affliction I have met withal by my maide servant . . . At her first coming she carried herself dutifully as became a servant, but through mine and my husband's forbearance towards her for small faults *she hath got such a head,* and is growen soe insolent that her carriage toward us, especially myself, is unsufferable. If I bid her doe a thing shee will bid me doe it myselfe; and she says how she can give content as well as any servant but shee will not, and says if I love not unquietness I was never so fitted in my life for shee would make me have enough of it. If I should writ to you of all the filthie reviling speeches and filthie language shee hath used towards me, I should but grieve you. My husband hath used all meanes to reform her, but she doth professe that *her nature will not suffer her to confess her faults.*' Do you find your eight-hour employe seemingly a specialist in what she will not do, over-individualistic and disobliging after this? Poor Mary Dudley's maide servant seems to have anticipated the I-must-follow-my-natural-impulses radicals by nearly three hundred years.

Nor was Mary Dudley's experience in any way extraordinary. Her cousin, John Winthrop, has similar sufferings to relate in a letter to his father: 'It is not convenient now to write the trouble and plague we have had with this Irish creature the year past. Lying and unfaithful . . . would do things on purpose in contradiction and vexation to her mistress . . . Have contrivances with fellows that have been stealing from our estate, gett drink out of ye celler for them; saucy and impudent, as when we have taken her to task she has gone away to complain of cruell usage. I can truly say we have used this base creature with kindness and lenity . . . a high spirited pirnicious jade.'

Again one John Wynter, head of the Richmonds Island settlement in Maine, writes to a friend in 1639 concerning one Priscilla Beckford, his 'maide servant': 'She hath bin now 2½ years in the house, and I do not think she hath risen twenty times before my Wyfe hath bin up to call her . . . she cannot be trusted to serve a few piggs, but my wyfe must be with her.' In men servants the Wynter family seemed equally unfortunate. Of one he writes, 'He is verry unwilling to do servize, says he is alwaies too hard labored; he cares not what Spoyl he makes, and will not be commanded but when he list.'

Of all the brave women of Colonial days, pioneers, forerunners, none has spoken braver words for the freedom of her sex than Abigail Adams, wife of our second President—one hundred and fifty years after the first settlement of New England, it is true, but in a day when the higher education of women was yet undreamed of. The letter was written in '76 shortly after the drafting of the Declaration of Independence.

'And by the way in the code of new laws which I suppose it would be necessary to make, I desire you to remember the ladies and be more generous and favorable to them than your ancestors were. Do not put such an unlimited power into the hands of the husbands. Remember all men would be tyrants if they could. If particular care and attention are not paid to the ladies, we are determined to foment a rebellion, and will not hold ourselves bound by laws in which we have no voice or representation.'

As early as 1701 six good wives served on a jury in Albany—Tryntje Roseboom, Cathern Gubertse, Angenutt Jacobse, Marritje Dirkse, Elsje Lansing and Susanna Bratt.

Even police dogs are no invention of modern German warfare, for in the earliest days the New England settlers had them trained to hunt Indians and wolves, but—unlike the Germans—they fined citizens who brought their 'doggs' to the meetinghouse.

'Sing not, hum not, wriggle not,' we read in an early book of etiquette for the young—although Puritan wriggling is not to be confounded with the contortions of the recently extinct shimmy.

TO WHAT extent the revolt of youth is attributable to this deliberate assault upon their impressionability, it is hard to say. The causes are various, and it is not the purpose of this article to enter into them, merely to show that as long ago as the very golden age of the Blue Laws, wild youth followed its will, while solemn graybeards shook their heads and knew that they were going to the dogs—familiar in these days as 'doggs.'

The dogs then, it would seem, is a destination for which youth is ever bound in the minds of its elders, yet which it has never yet—collectively, at least—attained. And what is—or are—the dogs? A place, or a state of mind? In any case, perhaps we do not need to concern ourselves greatly, inasmuch as, like the horizon, it is a destination that has never yet been reached.

Alien *Influence* on American Legislation

By LEWIS WORTHINGTON SMITH

THE danger of permitting the stranger who is lodging in the house to legislate upon the affairs of the home has rarely been illustrated as forcibly as in the campaign preceding the election of Lincoln

During the forties and the early fifties the fear of the foreign-born voter had come to animate the minds of Americans of the older stock very largely, both North and South. The act of April 14, 1802, stabilized what had been up to that time a somewhat shifting policy of naturalization. That act required the renunciation of titles of nobility and prior allegiance. Such renunciation is no doubt a substantial sacrifice on the part of the newcomer. It constitutes a sort of guaranty of the genuineness of the enfranchised man's new loyalty.

Always it should be remembered, however, that this loyalty is loyalty to a government, to a political organization. No man can renounce his allegiance to the ideas and the ideals and the sympathies with which his birth and his home ties have first endowed him. The sentiment for ancestral relationships and bonds of blood is something that holds almost all men even to the third and fourth generations. Allegiance to the political order under which we live is certainly important. The political order, however, is important almost wholly as a support of the social order. Loyalty to a social order, therefore, to modes of thought and conduct in human intercourse upon which a social order grounds itself, is the thing ultimately vital. However enthusiastically devoted to our form of government the new arrival on our shores may be, his enthusiasm as confined to that aspect of life in his new home may not contribute to our well-being.

At a special election held May 9, 1859, the people of Massachusetts by a considerable majority adopted an amendment to their state constitution materially affecting the elective franchise. By its provisions an alien was compelled to wait two years after naturalization before he was permitted to vote. The amendment was intended primarily as a check upon a growing practice of active naturalization of prospective voters immediately preceding election day. More or less fraud was consequent upon this method of swelling the returns, and Massachusetts was determined to maintain a purer ballot. This was certainly a legitimate purpose and one wholly within the scope of the rights and privileges of the separate states. Further, it was a domestic matter and it should not have been complicated by considerations other than those related to internal affairs.

At the time when this action was taken by Massachusetts we had recently had a substantial increase in foreign immigration, amounting in 1858 to what would be, relative to the population of the country then, the equivalent of some 600,000 a year in terms of the population of the United States today. Among the immigrants of the preceding decade and more there were a great many Germans, large numbers of whom had come to this country after the unsuccessful revolution of 1848 in their native land. From the circumstances of their own exile as well as from the fact that they settled almost entirely in the North, their sympathies drew them to the newly formed Republican Party.

One of the most momentous presidential campaigns in American history was coming on. The Democratic Party, intent on the preservation of slavery, had given President Buchanan at the last election a half-million more votes than the Republican Party had been able to poll for Fremont, with a majority in the electoral college over both Fremont and Fillmore of fifty-two. The alienation of any considerable portion of the Republican strength might continue the Democratic Party in power for another four years, heighten the animosities already evoked by the slavery question, and prolong indefinitely the struggle that had already produced a bleeding Kansas.

The amendment to the constitution of Massachusetts by which what may be called the alien's period of probation was extended had been submitted to the people of that state by a Republican legislature. As the question took shape in the minds of those who might feel themselves injured directly or indirectly by the action of Massachusetts, it became a ground of complaint against the Republican Party. In particular the Germans took it up as feeling the more aggrieved because of their interest in that party and devotion to its principles.

They were indignant that their countrymen, coming to the New World in search of larger opportunities than they had at home, should be compelled to stay in the United States and make themselves familiar with its institutions for two years beyond the five years required by the Federal Government before they could take part in managing its affairs. In his very thorough and searching study, *The Germans of Iowa and the 'Two-Year' amendment of Massachusetts*, Professor F. I. Herriott, of Drake University, says:

'Upon the passage of the amendment in the lower house on February 8 by such an overwhelming vote (177 yeas to 32 nays), the Germans suddenly realized the danger threatening their status. They arose *en masse* in angry protest, and their foremost leaders began to train their heavy guns upon the Republican Party.'

Senator Harlan once said 'Many immigrants are qualified to become citizens of the United States when they land—they are as intelligent, industrious moral and trustworthy—as the native population. This is particularly true of those from some of the German states. In their own country they enjoy the advantages of common schools—similar, and, as some think, superior to our own, open to the children of all classes, including the most indigent—and of academic instruction of the highest grade. The mass of people are well educated; and they furnish the world with their full proportion of the ripest scholars and most profound thinkers of the age. In the highest walks of literature science and art, they have no superiors. A people thus taught, emigrating to this country and desiring to become citizens, would seem to require but a short probation to fit them for all the corresponding duties.'

'Ultimately Will I Too—'

Sue Grundy Bonner.

Ultimately will I too
Go to meet the sea like you—
Emerald green and sapphire blue,
Shot with purple through and through,
Beautiful to view.

In some wild and lovely place
Where the crested billows trace
Patterns on the sea like lace
I will hide my weeping face
In its salt embrace.

'If'—the Dark Side of Polar Flying

(*Continued from page 2*)

shoreward. It carried a large berg up over the beach and toppled it upon a sleeping Eskimo village. The survivors wept when they told us their terrible tale.

Such a picture leaves no doubt in the pilot's mind about the difficulty of emerging from such an environment should he be forced down. True, wide leads offer a landing space for an amphibian plane; and occasional flat floes could permit a land plane to roll safely along and come to a halt. But the chances of either are slight. Moreover, the lead may close and the flat floe may be crushed into a pressure ridge half a hundred feet high five minutes after the plane comes down.

Of course we planned to work back to one of the northern continents from the Pole if we were forced into an emergency landing and were unable to get the plane into the air again.

I asked a friend of mine, an Arctic expert, to work out a plan for escape should this contingency come about. He handed me the following memorandum.

Some notes on Byrd's retreat if he and Bennett are forced to walk home.

1. Because of enormous distances and probable lack of communications, in case of trouble any plan for escape should be of utmost simplicity.

2. Travel along coasts after reaching land should be greatly preferred over Greenland ice cap or other inland routes. Along the coast is good hunting; cairns on important promontories can be left; and caches containing records and films will not be lost. This is not true of the ice cap.

3. In case of a crash there are three possible lines of escape:

(a) Back to the pack edge near Spitzbergen, to be picked up by ship. This certainly should not be tried if more than 300 miles from point of departure.

(b) Down the Greenland or Ellesmere Land coasts to Etah. The Greenland ice cap might be used if an early start can be made from Peary Land.

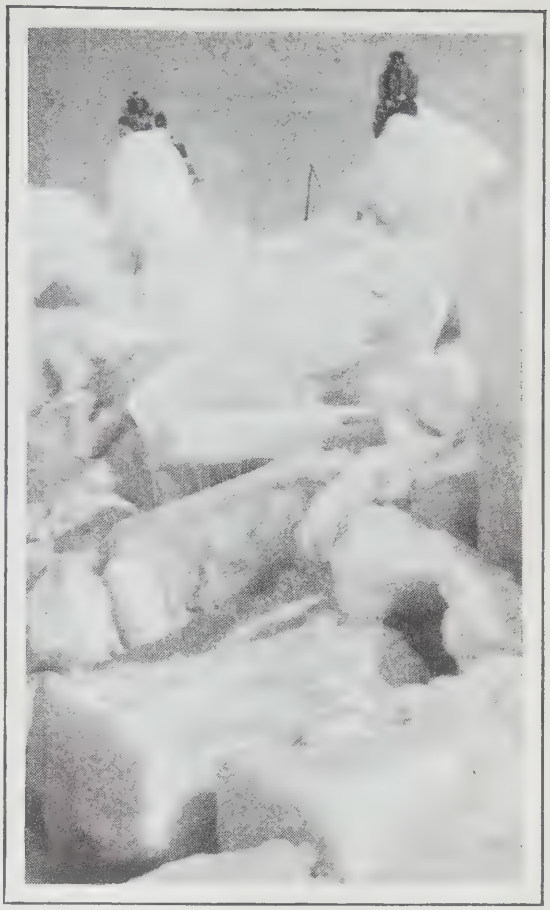
(c) Down the Banks Land coast to the North American Eskimos, thence to Alaska. This route is desirable only if trouble comes well west of Cape Thomas Hubbard.

4. Byrd must remember that in case he fails to return on time a search party will ultimately go for trace of him. Therefore, he should leave clear-cut clews to his plans and whereabouts as frequently as possible. And he should equip himself with knowledge of musk ox and caribou haunts. His failure to return would by no means signify that he had perished. A crippled companion might conceivably cause him to winter in Greenland or Ellesmere Land.

My idea was to fit out a light sledge on which Bennett and I would put our provisions, spare clothing, rifle and ammunition. We would drag this sledge by hand back to Peary Land or Grant Land, depending on which place we were nearer. As the memorandum indicates, it would not have been a good idea to work toward Spitzbergen. The constantly drifting ice pack, together with open water caused by the Gulf Stream in that sector, would have made escape doubtful.

Traveling conditions overhead would not have been particularly bad. The average summer temperature on the Polar Sea is not far from freezing. The wind is seldom high in July and August, and there is daylight throughout the twenty-four hours.

Among the adverse factors of travel on the ice were the rough going. Fogs would have delayed us. Raw cold and dampness would have made us thoroughly uncomfortable after the first few days. How far our strength would have lasted on reduced rations while pulling a heavy sledge is a matter for the most serious reflection.

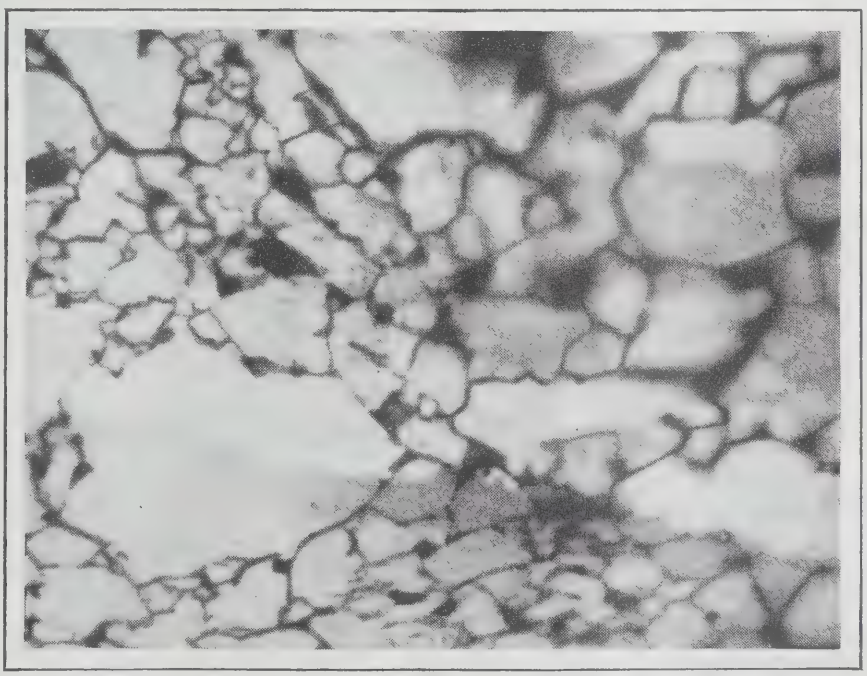


This view made in the Arctic regions affords a slight impression of why the problem of landing here is a serious one for aviators.

Of course I remember that the British did all their South Polar work pulling their sledges by hand. But we cannot forget that they were working over an ice cap with a fairly level surface; and that they had no leads of open water to face. Yet their sufferings were terrible.

Bennett and I felt confident that, in a pinch, we could fight our way back to land. We would navigate along the ice just as any mariner navigates on board a ship. We had two sextants for giving us our latitude and longitude by elevation of the sun. We had our sun compass to check our course. If anything happened to our chronometers we should not easily be able to fix our longitude. But I had anticipated this very accident. I had studied carefully all photographs of the northern shores taken by Peary and others, that I might recognize any promontory that we should pick up.

In the summertime pools of water form on the ice pack. Sometimes these pools become large lakes. These and the leads



When Byrd and Bennett were flying over the place where their instruments indicated the North Pole was situated they took this picture. It is a bleak expanse of ice and water.

compelled us to have with us some sort of boat. My plan was to put a canvas cover around the sledge and so ferry across. A hold-up on one side of the lead could well mean starvation. Peary nearly lost his whole party in this way in 1907.

We were equipped with Eskimo clothing. Our garments were of the skin of northern animals. Skin keeps out wind and is very tough. With the fur on the outside, one's body keeps cool in warm weather and warm in cold weather. Furthermore, such clothing is impervious to drifting snow.

For food we had items of high protein content, such as pemmican; and both biscuits and tea with enough sugar and chocolate to make them palatable. We planned to take fuel from our plane and use a small Primus stove. In very cold weather a man needs a hot drink before making camp. Otherwise he may freeze his hands and feet before he knows it. Moreover, raw meat, in fact any uncooked food, is a greater strain on one's digestion. If we got into trouble we should have to husband our strength to the end.

We had a light rifle and about fifty rounds of ammunition. But I was not optimistic about finding game. Though we might run into a polar bear or get a seal, I felt chances were ten to one against it.

DURING my stay in Greenland last year I acquainted myself with some of the native hunting methods. I counted on this experience to save us from starvation had our ammunition been expended or had we been forced to winter on the north shores of Greenland.

I deliberately avoided letting the Navy Department, or others, plan any special search for me in case I failed to show up. That is to say, I anticipated the impossibility of covering the vast area of the Polar Sea if Bennett and I were lost. The ice would carry us back and forth as it drifted. And we would march in the direction that we thought was proper—a direction that might be faulty. So it was to my mind a mistake to contemplate any real search of the ice pack itself.

The future, however, cannot be dealt with so arbitrarily. If we establish a Polar air route we must consider what would be done if a fast express flying over the Pole came down on the ice. Its crew might be fifty men. There might even be passengers. Certainly there would be a valuable cargo. The civilized world would demand some specific plan for rescue of such a party.

Some definite means of rescue occur to me at once. The plane or dirigible would be supplied with special smoke bombs. The sector or zone in which the enforced landing might occur would determine which of three points, say, would be selected for a rendezvous. When an aircraft failed to return time would be allowed for her crew to make their way toward the rendezvous. After prearranged intervals the smoke bombs would be set off daily by this party at six a. m., noon, and six p. m. In event of failure to locate the lost party in this way, it would have recourse to stores cached at various salient points, such as Wrangell Island, Banks Land, Cape Columbia, and so on.

The naval method of mathematical search might be resorted to. In this the search problem over a wide area reduces to a geometrical analysis. Planes go out on such courses as to cover an entire zone on a single flight. How difficult this would be may be judged from the fact that lost army fliers in Arizona a year or two ago were not sighted during nearly two weeks of steady flying by searching parties. Arizona would be but a drop in the bucket as compared with the vast area of the Polar Sea.

It is superfluous to discuss what might go wrong. Many things can go wrong in a science as new as aeronautics. Lubricating oil doesn't always work the same in low temperature. Metal parts and fittings often suffer by exposure to the high moisture content of Arctic air. Workmen do not do so well in low temperatures, thus increasing the chances of actual mechanical failure.

I am positive that the trans-Polar air route will be used in this generation. Too much time and distance are saved in a flight from Europe to Asia over the Pole not to have this route both popular and profitable. Also there will be passenger service from the United States northward, just for the sake of showing people the beauties of the Arctic.

There will be disasters. Men will be lost. Pioneer pilots will wander around on the ice and the old stories of Arctic suffering will be lived again.

But such suffering and hardship will be reduced to a minimum because we who do such flying are already asking ourselves the question that so many people have asked us:

'What would you do if you were forced to land on the ice pack?'

The Can Opener *in* France

By LOUIS C. KARPINSKI

CAN openers are a luxury in Paris. Nor would the Parisian appreciate the situation of the young American housewife who announced to her husband, 'We will have to go out to dinner. I broke the can opener.'

The lack of employment on the part of can openers is quite intimately connected with the general economic distress of France. Human labor is cheap and was cheap even before the war. In consequence, the labor of preparing and cooking vegetables ready to be served, with slight reheating, costs very little.

There are thousands of delicatessen stores where from large open dishes one may have cooked spinach, beans, a salad of peas and carrots, cooked celery, cauliflower and other vegetables. The prices are considerably less than for the canned article. For example, cooked spinach costs about ten cents a pound, and the prices of other vegetables are in proportion. Prepared meats, on the other hand, are relatively more expensive.

In the great majority of French families the wife as well as the husband is engaged in remunerative (so to speak) labor. This is possible partly since the French method of work makes two or three jobs grow where only one would grow in America. The working woman on her way home stops at the delicatessen and buys the materials necessary for a meal, these things requiring simply a modicum of heat.

Canned goods cannot be manufactured to compete in price with these ready cooked foods wherein the labor cost is small.

When One Plus One Is Really One

(*Continued from page 8*)

pair of glasses had been given us. There was a red glass for one eye, a green glass for the other. A Halloween affair?

A short film was shown which looked blurred to the naked eye. It was evidently made of two pictures, one red, the other green. When the glasses were put on, one eye saw the red picture, one the green. The two differently colored pictures were combined in the brain to look like one which had enormous depth.

So do you wonder that the girls dressed in their best clothes shrieked when the small boy on the screen turned the hose toward them and the stream actually seemed to land right in their laps!

The use of red and green glasses in this way was first introduced by Dr. E. W. Scripture, of Yale University. Just before the turn of the century he wrote the first book on experimental psychology in the English language. The title was *Thinking, Feeling, Doing.* It was soon translated into Chinese, and Dr. Scripture has since moved to London where he is a specialist in speech defects. The book has been out of print for many years, but in modern advertising and movie novelties we see this principle applied.

IN detecting counterfeit bills this principle is put to serviceable use. If two photographs of genuine bills of the same issue are compared in a stereoscope they still look flat, since each picture is the same as the other.

But if a clever counterfeit is put in one side of the stereoscope and a genuine bill in the other side the single image which the brain sees will have a wavy surface. This is because it is impossible to counterfeit exactly all the small lines on the engraving. Wherever the thousands of small lines do not exactly correspond the appearance of depth is produced and the wavy effect seen.

During the war shelters of big guns could be camouflaged so well that the human eye or the camera in an airplane could not detect them.

So this principle of disparate pictures was applied. Two cameras were mounted on the airplane, one at the extreme tip of each wing. A single control caused them to take pictures of the same object simultaneously. The two views of the same scene taken from so great a distance apart naturally magnified any depth when viewed in a stereoscope. Footprints, small huts, trenches covered with a roof of brush, stood out in these stereoscopic prints like some demon bearing down on us in a dream.

Bloodless surgery seems not to have been achieved by physicians, but psychologists can demonstrate it easily.

The intoxicated man has difficulty in avoiding objects partly because his muscular control is hampered for the time being, and partly because the alcohol has benumbed the brain centers which control the eyes so that the two pictures combine into one.

The effects of intoxication can be imitated if you close one eye and try quickly to touch your left thumb with your right little finger.

Going After a Good Time

(*Continued from page 12*)

I talked to Pete—a whole rest house—and in the center of traffic.

when they are having a good time they are doing something wrong. The reason is, they take themselves too seriously. Their false obligation to their set affairs is so strong that if they lapse for a moment and actually forget themselves, they think they are doing something wrong.

I have seen a long succession of the most important men quit their jobs and think the world was coming to an end. But the fellows who took their places almost invariably did the work better. The mere fact that a man has already demonstrated his importance means only that a number of others can step in and do his work better than he does it.

One-half of the world is so overburdened by a sense of duty and its own importance that it doesn't know it is merely feeding the sense of irresponsibility in the other half. I am not advocating irresponsibility, but power.

What realiy is a lack of a sense of responsibility? Isn't it thinking your affairs are more important than anybody's? When you begin to realize your unimportance in the scheme of things, then, and only then, you begin to cut ice.

Horace Greeley started the New York *Tribune* in 1841. After that he tried to be President. He failed. Before that he was a typesetter—one of the best and fastest in the world. When at work he would say to the man next to him:

'Have I had my lunch?'

If the man said yes, Horace would work on until the day was over, whether he had eaten anything or not. If the man said no, he might eat twice and never know it.

Horace Greeley never seemed to know whether he had a stomach or not. Well, that is one way, I reckon, of having a good time.

What is a good time? It is something you don't always recognize at the moment, but that keeps getting better afterward. That is the test—rising permanence. It is really the difference between right feeling and wrong feeling. If you feel right, no matter where you are or what you are doing, you are always on the job.

The widespread feeling of excitement so evident today in this country is due to wrong feeling. They are all going out after a good time, and not getting it. That is what makes folks restless. Right feeling is relaxation—continuous.

Right work is merely putting yourself in condition to feel like doing it. You get this by breaking the current of your thought. In reading, the eye does not run along the line of type continuously, but proceeds by a series of jumps from one phrase to another. Right work is like the beat of the heart; there is a moment of rest in between. I rarely get tired now, because I rest rhythmically. When that feeling of impatience, of irritation, comes on, quit. Get up and walk around. Look up at the sky. I just went out and talked to Pete, the traffic cop.

'Never have I felt such a wind,' said Pete.

'It's going to be hard winter,' I remarked.

'It looks that way,' agreed Pete. Pete is a whole rest house—and in the center of traffic.

Wrong feeling is an acute consciousness of our own aloofness, that we are set apart. For example, on a rainy day—ideal day for reading—you cannot settle down, even to an exciting book. Why? Because you cannot share yourself with it. Your complaint is ingrowing, not outgrowing.

Do not jump to the conclusion that I am leading up to the shopworn theory that we must live for others. That is almost as bad as living for yourself. I am more and more convinced that it is a mistake to live for anybody or anything, but just to live.

Being alive is important only when you *are* alive. I know a lot of people who *think* they are alive when they are not. You are alive when you are feeling alive, and not when you are thinking yourself alive. The joy of life does not consist of doing, but of being. When you are, you do. It's the only real occupation.

Almost all the people I know are trying to escape from something instead of meeting it face to face. The best time you can have is often with the man you are afraid to meet. We always want to get out of what we think we are doing, into something else. We are really not doing it. When you really do something you like, having taken joy in the doing, nothing else matters. You have a boon companion there.

I give you my solemn word of honor, I am not trying to give anybody any advice, I am just feeling good, and I simply want to share it with somebody—everybody.

The fact is, we all want to get out of what we are doing into something else; and we want to get out, not because of the environment but because of ourselves. The stable doesn't change to the horse, but the horse to the stable. We want to escape, while all the time we lock ourselves in. Repression, they call it.

How glad we are to get back home after a trip; yet home is just the same as it was—unless you've left the water running. I know a man who did that and when he got back his home was ruined. He was in such a hurry to escape that even the plumbing felt it.

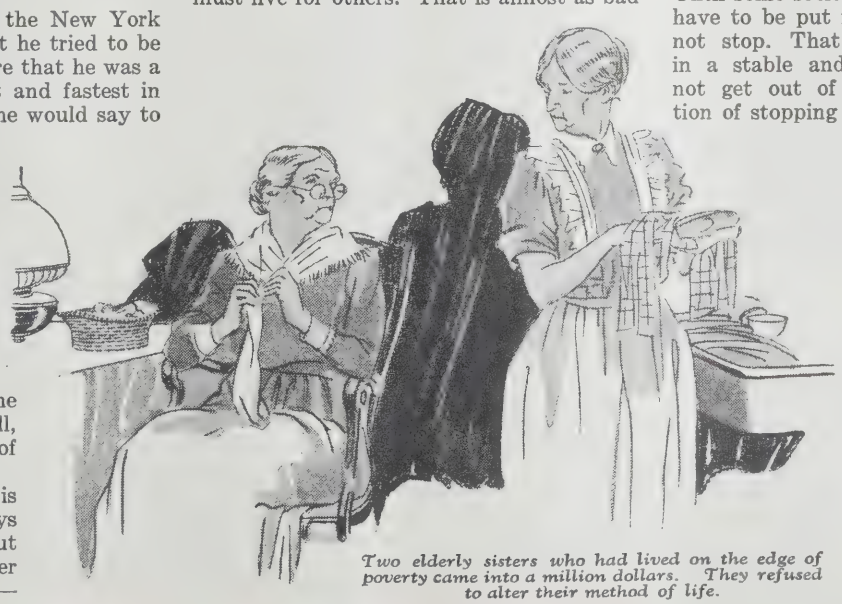
Two elderly sisters, who had lived all their lives on the edge of poverty, suddenly came into nearly a million dollars. They refused to alter their method of life. They said they had always lived that way and did not wish to be disturbed. Typical. We complain when there are ruts in the roads we travel. How about ourselves? Some folks are so afraid of skidding they make their own ruts.

You can put a lion and a canary bird in cages, feed them on the right food, and they will gradually settle down to a quiet life. Restlessness grows by what it feeds on. Great men are always relaxed.

Restlessness is a habit just as quiet is. Until some society women break down and have to be put into sanitariums they cannot stop. That is, like a horse locked in a stable and fed on oats, they cannot get out of themselves. Any suggestion of stopping makes them want to kick down the framework.

Strange to say, this restlessness, now so common among us, is due altogether to our reluctance to meet things as they come, to the widespread habit of sidestepping; to our lack of adaptability. We set our camera minds to a certain height and focal distance and then let them stay there until the parts rust and we can't move them. With as many interruptions as we have, we don't like to be interrupted.

I never work when I



Two elderly sisters who had lived on the edge of poverty came into a million dollars. They refused to alter their method of life.

am at work. I have done it all beforehand. The two great mottoes are *carrying on* and *carrying out.*

Go over in your mind all the good times you have had. Remember them? Then there is something wrong, for the reason that your good time should have been so continuous that it all ran into one. Is this possible? Why not?

Cast out for the moment all seriousness, all sense of responsibility, and think of the world only as a vast playground and all the people in it merely playfellows, never forgetting to leave your own petty concerns out of it. Consider from this point all the fun there is in it. Watch boys playing ball and feel like that. Why not?

And in this mood, keep yourself so alive that you will respond to every suggestion that comes to you to have a good time. Don't think your work will be neglected. Reflect that right now the biggest men in the world are doing the biggest work in the world just by that rule, namely, to treat work as incidental. You do ten times as much work under the inspiration of joy. Don't consider yourself—do anything. Go anywhere. You will gain tranquillity constantly, because you will merge yourself in world consciousness, forgetting yourself. When you have buoyancy you have everything. To a cork riding them, there are no permanent waves. It isn't getting tired that tires people, but the thought of it.

The World's Champion Guesser

(*Continued from page 3*)

revenue, was $2,500,000,000 for the first year. Collections were $2,504,000,000.

Lacking any data from previous experience to guide him, McCoy rivaled these striking results with his estimates on railroad ticket taxes, telegram taxes, movie admission taxes, and countless other imposts slapped in the exigencies of war time upon almost everything for which the American people were spending money.

McCoy was forced to work without data on their productiveness, because scores of the articles then made to bear an impost had never before been taxed. In cases without number even dependable production and consumption figures and the like were nonexistent. A virgin country, beginning to tax its citizens for the first time, would have been little more barren of precedents.

It was then that McCoy hitched a revealing study of human nature, and an invincible faith in the law of averages, to a slender and spotty collection of statistics raked up from the four corners of the land. Somehow he made this team work, and work valiantly.

How?

'Computations,' says McCoy simply, without a suspicion that his answer is cryptic.

Pressed, he explains:

'I took what material was available, census office reports, bank statements, and the like, and reasoned from these data and from what I saw myself.

'Statistics don't amount to much unless they are combined with common sense.

'The tax on movies? I went to some, to see how many people were attending picture shows, and then with what statistics of the movie industry were available for the country as a whole I reasoned it through. My computation worked out.

'With chewing gum some of the questions that occurred to me were: "How many chew it?" and "Won't the war increase the habit?" For the taxes on sporting goods of all kinds I found out how many clubs there were in the country which had to do with athletics. The number of them is surprisingly large. Then I watched to see, for instance, how many youngsters were playing ball.'

McCoy never arrived at an explanation of just how the number of boys playing ball near whatever post of observation he chose in Washington gave him the key to the immense total for the entire country. But his estimate may safely be attributed to some ingenious application of the law of averages. He continued: 'I went abroad, too, to learn all I could about what had been done in other countries. I tried to find out how certain taxes had worked in one country, then in another and another. You can learn what taxes will produce by experience. If you check up three or four ways and get the same result then you must be right.

'One surprising fact I learned in studying American business in connection with taxation was that we knew less about our own industries at that time than foreign interests knew.

'Those interests were getting reports on production which we lacked. But, incidentally, that was where certain countries got fooled when we came into the war. They knew what we *were* doing, not what we could do.'

If McCoy isn't counting trucks the chances are that he fingers every now and then, with seeming carelessness, a black Chinese abacus, or reckoning board, lying beside him on his desk. On the rods set in the frame of this ancient device are thirteen rows of little movable buttons. It will record whatever figures are flying through McCoy's head up to the trillions.

Pen-and-ink impression by GERALD VAN DER HEYDEN

McCoy, more than likely, is doing a bit of computing on the speed of retirement of the $19,500,000,000 public debt. His abacus is one of the curiosities—and mysteries—of the national capital. Arresting and sometimes startling facts have issued from the juxtapositions of its black buttons, right before the eyes of Senators and Congressmen at finance committee meetings. The lawmakers are never sure what will come from it next.

McCoy picked up his abacus long ago in Shanghai, for a Mexican silver dollar. For a quarter of a century he has used it daily. Arduous service has so weakened its frame that it seems to hold together only by the grace of four stout rubber bands.

But for a man who must reckon in large figures while nine-tenths of his brain is devoted to reasoning out the broader aspects of the problem in hand, McCoy will tell you, this calculator, used two or three thousand years ago by the Greeks and Romans, is far more useful than an adding machine.

And the abacus, odd as it is, is no more peculiarly McCoy's own than his job itself. For all McCoy's functions which are most vital to the Government he serves are substantially of his own creation.

WHEN he became actuary, after a year as assistant, the functions of his office related to such routine matters as Treasury Department finances, and calculations having to do with interest rates, maturities and sinking funds for Government loans. In no way were they connected with tariff or tax legislation.

But McCoy learned quickly how the various parts of the Government operated. Soon Cabinet members and their aides in other departments were sending over to the Treasury to 'borrow the mathematical wizard.'

Finally, to aid in drawing up trade agreements with a multitude of foreign countries, the State Department 'borrowed' McCoy. It kept him for three years!

Throughout that period McCoy gave up half his time to the State Department's task, one requiring the most searching analysis of the economic resources and industries of every country involved.

Before the end of it was reached McCoy had gained such a mastery of underlying facts and policies that, for the intricate technicalities of trade parleys, the foreign negotiators were turned over to him. No final agreement was entered into by the United States, after that, without McCoy's O. K.

McCoy's gradual extension of his functions made the actuary's work so indispensable that the Government at last was forced greatly to increase the salary. It went up to $7,500 a year—for a technical, not a political job. And that, as any number of brilliant young chemists, statisticians, engineers and physicists in Uncle Sam's far flung but obscure laboratories and offices can testify, was little short of miraculous.

Even then, of course, the Government was paying only a fraction of what such services would command in the world of big business. Tax experts in private employ make up to ten times as much, and like the Government officials, they come often to McCoy for their facts.

A number of these private posts have been tendered McCoy. Always they have been declined. Some of McCoy's friends ascribe this to a conviction that he never could find elsewhere so vast a scope for his figures and his uncanny 'guesses.' Whether or not this is part of his motive in 'carrying on,' it is certain that McCoy loves his Government post.

He feels, in his own phrase, that in his indirect but potent influence upon revenue policy he is always 'working for Uncle Sam

'Go ahead an' tell it to the boys. The hangin' days is over.'

The LUCK of The Hooker Mary Ann

By IVAN SWIFT

Illustrated by LES MANGE

IN THE early days of the white man's settlement in Michigan a drug store in a lake-port town was not infrequently a grog-shop, with the pretty name of Blind Swine or Blinking Tiger.

The keeper—who would answer as quickly to the title of tapster—was likely to be a pioneer of the region, with many a fetching reminiscence to relate to his customers. In any event, such was the trade and character of Henry Doherty. Big of bone, knobby-handed, loose-jointed, swagger of bearing and as weather-seasoned as a one-time schooner master might be, he kept his rank of captain after he had quit the lakes for the less exposure and safer hazard of a shore enterprise.

It was to the captain's place of business that his old friend and fellow-seaman, Neal Mulvaney, came one winter's day for a little warming up and an hour's chat around the big box stove.

Neal was a forceful man with an Irishman's governing instinct and was sometimes called the King of Beaver Island—successor by right of conquest to the Mormon ruler of an earlier day.

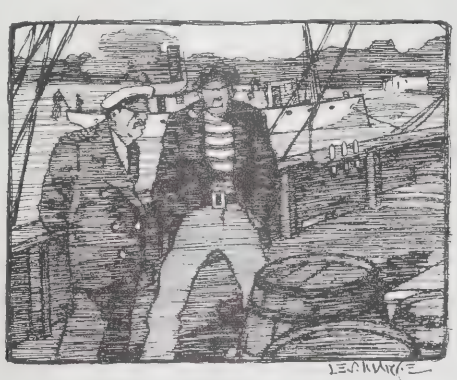
The King of the Beavers was a picturesque character with an unmistakable brogue and a ready wit; but of a close mouth in the presence of strangers. And the half of his fifty years' adventure has never been told.

'I say, Henry,' began Neal, 'are ye rememberin' the divil of a fix we was in the spring o' '68? That was a close shave for a couple o' mickies, hey?'

'Well, Neal, I've had such a shiverin' lot o' jumps for me life I'm gettin' stale on rememberin' of 'em all. Go ahead an' tell it to the boys. The hangin' days is over anyhow—an' that's luck for me an' you. I'll stand by an' see you keep your bearin's.'

'Never mind the bearin's, Henry. I kape a dayry in me hat, an' me word is good for a while.'

Lighting his pipe with a coal, Neal resumed: 'Back in the sixties Henry an' me was sailin' the hooker *Mary Ann*—carryin' things as was needed most betwixt Big Traverse, the Straits an' the Beavers—sometimes runnin' in here for shelter or a little trade.—No, we wasn't tradin' a-tall a-tall them days, hey, Henry?—But sometimes we done a sthroke o' seafarin' just to kape the sarpents out of our lubberin' boots. Don't do for a sea-dog to stay on land too much. He gits the rabies—an' rabies is bad. But they's different kinds, an' sometimes they ketches a feller on the lakes. An' this what I'm tellin' yez is one o' the times when Henry an' me had a bresh with the rabies on the high-seas—and if we hadn't had the dope in our oilers we'd seen stars by daylight.



'What's your cargo?' says he.

'It were in the spring o' the year. The weather was giner'ly fair, and a little too calm for the business we was in. For the want o' some other diviltry to get up to, we hit the Canadian Soo, took on a half a load o' spirits an' tobaccer, and weighed the crab betwixt two days. The next night we puts into Mackinac an' picks up some empty fish-kegs—a couple o' layers for the hol' and a few more for the deck. Then we sets our nose for the islands to peddle our *Canada-west* an' "T and B."

'The profits on the cargo we had was a new boat for the both of us—*providin'* we slipped the *Andy Johnson*, which was the cutther doin' the rivenue business in them days.

'The *Mary Ann* was a dom foine boat, Henry'll tell you. She could come up with the next one if the breeze was stiff, an' weather a gale like a sea-gull. But as for her name—we kept that to ourselves—hadn't bothered to put the letthers on the outside; an' divil a glim did we carry—for reasons of our own.

'Comin' out o' the Straits we sighted a steamer off the sta'-board bow—an' we wasn't hankerin' to meet her at that particular toime. We payed off a couple o' points on our poort tack, cut through the 'Shanks by one o' the narrer channels an' hit the deep wather again a mile off the huckleberry swamp. That was a lucky cut for the *Mary Ann*—sailin' without a lamp. The night was dark. We luffed up betwixt the passin' cutther an' the black pine trees, an' they was nothin' but a ribban' o' sand behind to give us away.

'Then, all to onct, while we was pattin' ourselves on the back for smooth dodgers, one o' them dom *jack-o-lantherns* comes out o' the Injin graveyard and stuck on our main spar—an', bedad, there she swung, like a 'lectric light as big as a moon! Then, just as I was sayin', "Henry, our jig's up if the bloody corpse-candle don't let go," the steamer give us a blow less than a half a league to the north—an' we reconizes her for the *Andy Johnson* as sure as the divil!

'It's a bad sign omen for the jack-lantherns to foller you, and I got no faith in 'em—they leads to the rocks. And here was our bad luck already beginnin', with the *Mary Ann* in a pocket and only one way to git out. Of course the steamer couldn't get over the bar, an' she had eight miles to go round the point. She come about an' made for it—all the time seein' our divilish headlight that was markin' us every minute, whether we moved or stood still.

'The wind would o' put us to short tacks an' we didn't stand two fingers o' beatin' the steamer out. Henry was gittin' white in the face, and all to onct he picks up an iron belayin'-pin to smash the lamp. I says to him, "Go easy Henry, go easy! You're fightin' the ghosts, and it's Davy Jones for us if you do it!" Well, soire, would ye believe it? In that very minute the bloody lanthern quits the spar an' sails off with the wind, cuts the 'Shanks at one o' the channels an' makes for Bob Low, back to the nor'-east, an' just about our speed!

'Well, soire, as sure as Henry's a temperance man, the old black *Andy* puts about again an' makes for the candle!—leavin' us to git out o' the pocket and into the fair wind. And they wasn't a steamer on the

lakes could ketch the *Mary Ann* in a fair wind. We puts for St. James then, thankin' the stars we didn't break the spook-light.

'You see, if Henry'd broke the candle the cutther'ld said we doused our glim—that'ld been suspicious—an' she'ld o' come in an' hunted us for a fox if it took till mornin'. It'ld been the same if the candle had went out herself, or if she'd floated off in any other direction. But the wind was right, and a bit of a puff—or Henry's swingin' the belayin'-pin—pulled the blinkin' corpersant off the spar-iron, an' took her an easy swing right in the coorse a small boat'ld natur'ly foller to git through the 'Shanks into the Straits.

'That was close shave number one—and if Providence ever favored a pirate, that's the toime He done it.

'Well, then we was tolerble certain we'd got rid o' the cutther for a while. We figgered if she follered the jack-lanthern she'ld be by soon somewhere in Hudson Bay, stuck in the icebergs. So we does a good day's business off the Beavers, then some more with the Injins at Charlevoix; an' late the next night but one, with a good bit of our cargo still in the hol', we puts into this town for a little time with the boys. But this harbor was hard to git out of an' too temptin' to Uncle Sam's jackies; so we figgered on crawlin' away early in the mornin' if the wind was willin'.

'We turns in for a rest—a little the worse for grog. I guess we must o' pounded our ear pretty hard, an' when we woke up in the mornin' it was broad day light an' never a breath o' wind!

'We comes out on deck an' looks acrosst the harbor;—an' there, bedad, is the *Andy Johnson*, rivenue cutther, anchored as calm as ye plase! Divil of a fix again! She'd come in the night while we was dreamin' o' jack-lantherns an' sea-sarpents. So there we was—a skunk in a hole with his tail stickin' out.

'While we was holdin' a council and inventin' excuses, a dingey puts out from the cutther for a mornin' call on *Miss Mary Ann*—the loidy without a name an' never a glim!

'The officer climbs over the rail, an' says, "Good mornin', gintlemen." And I says, "Good mornin', your honor. Nice day for fishin'." That's all I had to say; an' Henry says never a word.

'Then the officer says, "What's the name o' this hooker?"

' "The *Mary Ann*," says I.

' "Why ain't ye got her name on the stern?" says he.

' "Well, Captain," says I, "it's this way. We just been paintin' her over, an' she's only dhry enough today to letther the name on her."

' "See that ye get it on before ye leave," says he.

' "That we will, Captain," says I.

' "What's the matther with your lights?" says he.

' "Well, soire," says I, "we're just in from Frankfort and our oil g'in out last night. We come in here to stock up this mornin'."

' "See that you do," says he. "What's your cargo?"

' "Fish-kegs, soire," says I.

' "Open the hatch an' toss 'em up!" says he.

'I was beginnin' to get very-coorse veins about that toime. I gives Henry the wink an' sends him into the hol'. He goes down an' throws out a couple o' dozen kegs off the top layer. The officer kicks 'em over a bit, then he says, "That'll do." (An' he don't have to say it *twice* a-tall.) Henry comes up, puts back the kegs an' covers the hatch.

'Then the officer gives us a spiel. (Henry all the toime coilin' the lines.)

' "I have a good notion to take yez in tow for Manitowoc," says he. "But ye look like honest men (begob, that's what he said) an' I'll loose ye this time; but look to your lights an' your name an' don't let me ketch yez again in a fix like this!"

' "That we won't," says I. "Much obleeged to ye, Captain." And the officer goes away.

'That's the close-shave number two. We fixes the lights an' the name an' puts out with the first breeze. An' the *Mary Ann* was never ashamed to carry her colors from that day on. That's when she got religion—an' for thirty years she lived a virtuous girl.'

The Triumphant American Mule

By UTHAI V. WILCOX

RECENT statistics show that the long-eared, loud-voiced mule still continues to do a full share of the work of the farm despite the progress of motor-propelled machinery. The mule population of the United States has grown nearly a million head in the eleven years following 1914. It is now estimated at more than 5,411,000.

Government officials note that the growers of cotton, tobacco, rice and sugar cane have swung over almost entirely to the use of mules in preparing their crops. Experience seems to indicate that the mule can do the most work on the cheapest feed and with the lowest grade of driver.

Replies received by the Affiliated Press, from the leading mule markets of the country, such as St. Louis, Kansas City, Atlanta and other places, show that the demand for mules is today very keen. In fact, one handler of farm animals said that 'not since the war, when mules were used for cannon fodder, has the demand been so brisk.'

The mule is becoming a favorite over the horse for the farm. The Kansas City market, as an example, showed 65 per cent horses to 35 per cent mules in other years and now it is 85 per cent mules and 15 per cent horses.

This does not reflect a lack of usefulness for the horse, or a lack of popularity, but it does indicate that the American mule is an increasingly popular farm animal.

The horse is still popular, but like the farmer, is going cityward. The survey indicates that the reason for this lies in the fact that the horse has been competing not only with the mule and the tractor for drawbar use on the farm, but also with the steer, the dairy cow and the hog. The modern farmer figures his time as well as the cost of feeding. The returns from his time and feed required have resulted in the horse being out-bid. That has forced the horse into other lines of usefulness about the city where his worth brought a higher return than on the farm.

Strange Men

(*Continued from page 14*)

office. He had 'the soul of a poet,' said Older, 'and the habits of a sybarite.' He was handsome, well-dressed, olive-skinned, large-eyed and had the languorous air of a gentleman who had been reared in luxury.

Pedro had a hard-luck story to tell on behalf of a friend. A friend in Los Angeles, beset by great difficulties, had made the mistake of forging a check. For this he was sent to prison for five years in Colorado, where the crime was committed. But he was so young and behaved so well in prison that, after serving a year, he was released on parole. He returned to his home in Los Angeles, resolved that his parents should never know that he had been in prison. He found work and was getting along well when an unscrupulous deputy sheriff ascertained the facts and began to blackmail him.

Under threats of exposure, the poor boy first gave up $50. In a month, he had to give up $50 more, part of which he had to borrow. When a few weeks later a demand was made for $90, the youth forged a check to get the money and thus prevent his parents from knowing about his past. Remorse soon overcame him and he bought a bottle of poison with which to kill himself. He was on the way to San Francisco, determined to put an end to himself in such a manner that his identity could never be discovered, when he met Pedro, his old friend, on the train. When he met Pedro he had just finished reading an article in Older's newspaper that made him wonder if the editor would not help him as he had helped other men who had gone wrong.

'Where is your friend?' asked Older. 'I shall be glad to help him if I can.'

'I am the man,' replied Pedro.

Older called in a former prisoner who was working in the office to hear Pedro's story. After hearing it, he told Older that it sounded true to him.

So Older decided to go with Pedro to Los Angeles, take up the check he had forged, get his job back if possible, and expose the crooked deputy sheriff. Pedro, however, had only eight dollars, so Older told him to use this to buy his Pullman ticket and Older would pay his railroad fare. They were to meet at the railway station at eight in the evening and take the train for Los Angeles.

Older, who was at the station a little ahead of time, was quite surprised to see Pedro walking back and forth across the waiting room, immaculately dressed, wearing gloves and carrying a gorgeous bouquet of roses.

Older was somewhat flabbergasted but he had told Mrs. Older and a number of friends that he was going to Los Angeles, so he decided to go and hope for the best.

But when he told Pedro to go and buy his Pullman ticket, Pedro said he was sorry but he had spent his entire eight dollars. He just had to have a new pair of gloves and he was so fond of roses that he could not resist the temptation to buy a bouquet.

Older stood this shock, too. Aboard the train they went and were in Los Angeles the next morning.

(*To be concluded in an early issue*)

The Charge Is—'Materialism'

(Continued from page 15)

But the Records in the Case Show THAT—

The Accused Nation—America:	*The Accuser Nations—Our Friends Abroad:*
was against the well-being of all, conquering dread diseases, overcoming common dangers and difficulties.	slaying of tens of thousands of their common people by disease and famine, while the few preserved at all costs their skins and their granaries.
Has rushed with all the resources of wealth and science it possesses to help outsiders everywhere in times of disaster and dismay.	Have accepted the help and branded the helpers as steeped in selfishness and materialism.
Has turned huge resources to scientific development for the benefit of the whole of humanity; has made possible by its achievements the bringing into closer communication of the whole of humankind, breaking down the barriers of separateness and ignorance behind which are bred suspicions and the antagonisms of peoples—the mightiest blow for human weal struck since A. D. 31.	Have resisted anything which tended to interfere with hereditary powers—individual, class or caste—anything which might interfere with creeds, cults, 'isms' and codes too shaky to stand against the general enlightenment of the millions.
Has shown and is showing the whole world the spectacle of all colors, creeds, and races working together in amity.	Have written and are even now writing into history a record of bloodshed, rapine and intrigue among the nations.

Tube Connects Countries

Twin steel tubes which were lowered into a trench extending over more than half a mile of the Detroit River bed.

IT WAS a thrilling and novel experience, sixteen years ago, to cross for the first time the international boundary between the United States and Canada through the Detroit River Tunnel, seventy-five feet under the surface.

Over a year of preliminary work preceded the beginning of the actual construction of the tunnel. Miles of blueprints were prepared; thousands of tests and analyses were made; test holes were drilled through the river bed to the solid rock below; the flow of the current was measured; samples of the water were analyzed for their chemical content and action.

The actual construction period covered three years and nine months, and it cost complete, with tracks, pumps and electrical equipment, nine million dollars. The total length of the tunnel from portal to portal is one and six-tenths miles; from end to end of the approaches it is two and four-tenths miles.

The
Old American Dances,

which are now in popular revival, are contained in

'Good Morning'

An interesting book about the beautiful dances as taught in the

Ford
School *of* Dancing
at Dearborn

It includes calls, music and a series of illustrations visualizing the various steps. In addition, the origin, etiquette, style and deportment of the dances are clearly described. There are also important suggestions for arranging and conducting a successful dance.

Durably bound in paper cover, printed in clear type, 169 pages.

The price is 75 cents, but readers of THE DEARBORN INDEPENDENT may obtain a free copy in return for obtaining one new subscriber for this magazine.

CHATS WITH OFFICE CALLERS

'That election in Ontario,' said ***the Traveling Man,*** 'reminds me of old days in Massachusetts. There's nothing final about it and the province is as likely as not to flop back into the dry column and because of pretty much the same social factors which operated in the shoe and textile towns north of Boston.

'In Massachusetts local option prevailed and every municipality voted on the issue every year. Boston, the New England "Hub," was, of course, overwhelmingly wet. Saloons were licensed, closed promptly at eleven o'clock every night and no one even hinted or suggested that they operate on the Sabbath, not even the ardent personal liberty cohorts who now so loudly deplore "taking the *Sun* out of Sunday."

'A law to compel drinking places to dispense with screens narrowly missed invalidation because its sense was made ambiguous by the deft transformation of a comma into a semicolon in the official copy, a mysterious bit of legerdemain that gave the law fame as "the semicolon act."

'It was upheld, however, whereupon the saloon sought basements, alleys and back rooms.

'Up in the shoe and textile belt a curious game of off-agin-on-agin went on for years. Lowell, Lawrence, Haverhill and Newburyport voted "Yes" and "No" alternately, according to a scheme that could be forecast with a reasonable degree of certainty, especially, if I remember aright, Lawrence and Haverhill.

'Both had a considerable population of young factory operatives who floated about a great deal. When Haverhill went dry they spent Saturday nights in Lawrence and some of them shifted their jobs. Within a few weeks Haverhill merchants and manufacturers began to complain.

'On the other hand the good citizens of Lawrence discovered the presence of a not entirely desirable addition to their population and the aspect of their downtown district on Saturday night didn't please them at all.

'The result was that at the next election the wet town voted itself dry and the dry town concluded to indulge in a wet spell.

'Restaurant keepers had a temporary partition around their bars, which went up and came down as the political vane turned for or against them, but none of them regarded any verdict as final. And, in the main, they were right about it.

'Ontario, being a border province with a number of points convenient to the thirsty in "The States," will have much the same experience, with, very probably, the same result.'

From a conversation with ***the Author,*** who is always picking up strange bits of information, the spirit of sensationalism that leads some odd little journals to give prominence to 'astrological' features and to the so-called 'occultism of numbers' is no new thing. In the days of the French Revolution, when Reason was supposed to reign, the most preposterous notions were given currency, among them that the number twenty-one was, as it was said, 'potent.' The weak-minded were especially perturbed when it was pointed out by the number-mongers that:

April 21, 1770, Louis XVI was married.

June 21, of the same year, occurred the fatalities at the marriage feast.

January 21, 1781, was the date of the fête at the Hotel de Ville to celebrate the birth of the Dauphin.

June 21, 1791, was the day of the flight to Varennes.

January 21, 1793, Louis was beheaded.

The number three in connection with the ninth month was supposed to be 'potent' in the case of Cromwell, and it was pointed out that he was born on the third of September, 1599; that the battle of Dunbar was fought on the third of September, 1650; that the battle of Worcester was decided on the third of September, 1651, and that Cromwell died on the third of September, 1658.

The Stuarts again were fearful of the number 88. The first Stuart king, Robert II, died in 1388; in 1488, James II was killed at the siege of Roxburg; Mary Stuart was beheaded in 1588 (new style); James II was dethroned in 1688, and Charles Edward died in 1788.

The Hanoverians had no numeral affinity, but the day Saturday was considered a direful one for them. For William of Orange died Saturday, March 18, 1792; Queen Anne died Saturday, August 1, 1704; George I died Saturday, June 10, 1727; George II died Saturday, October 25, 1760; George III died Saturday, January 30, 1820; George IV died Saturday, June 26, 1830.

'Two generations have elapsed,' said ***the Student of Race Problems,*** 'since the Civil War, and the prophecy of the pro-slavists that the freed black people will swarm forth and cover the whole land is rapidly coming to pass. Abraham Lincoln was an open advocate of colonization outside the United States for the Negro, but Liberia is a living example of failure where the black man is left too remote from acquired contact and communion with white men and a white man's government. Friends of the Negro are now advocating close segregation, separate and apart from whites.

'The American Negro has already proved his self-sufficiency in this respect in several instances in the United States. Three towns, the inhabitants of which are Negroes, flourish in the state of Oklahoma. The towns in question are Boley, Red Bird and Taft, and they are governed in an orderly and efficient manner by Negro executives in every root and branch, and, strange as it may seem to a northern white man, none but Negroes are welcome there and white men are admonished, should they happen to visit the towns, to leave before sundown.

'Liberia, the only existing Negro republic, prohibits the ownership of land by whites.

'The inhabitants of the Oklahoma towns are not all Negroes in every sense of the word, however. A great many of them are of a Negro-Creek-Indian mixture, and, peculiarly, politics again enters into the destiny of the Negro, and a political accident gave many of these Negroes the benefits that came to the Indians in this section of the country.

'The Creek Indians, always hostile to United States authority, allied to England in the Revolution and the War of 1812, ran true to form during the war to abolish slavery and allied with the Confederacy. The Creeks were slaveholders of magnitude and fought valiantly against the forces of the Union. After the conflict the Negro freedmen were classed as members of the Indian tribe and, along with the Creek full-bloods, inherited land allotments, which had a great bearing on the promiscuous intermarriage that followed. The result is, in some instances, an almost utter extinguishment of the characteristics that made the once proud and valiant Creek nation a most formidable foe that taxed the talents and resources of an Andrew Jackson to subdue.

'However, the Negroes gained little if any of executive ability from their red compatriots, and Boley, Red Bird and Taft as orderly, happy and thrifty self-governed communities must be counted greatly to the benefit of the American Negro. What has been done there can be done elsewhere and therein may lie the solution of our vexing race problem.'

'When I was a young man,' reflected ***the Superannuated Minister,*** 'I had very clear ideas on how old men should live. Now that I am old, I am not following the prescriptions I then made for the conduct of aged people. But I think I know just how young men should live. Yes, indeed. I am tempted, now and then, to try to make certain bitter observations, but whenever I think of my doctrinaire notions as a young man, I refrain.

'After all, I find that we men can learn nearly everything except how to live. We can advance opinions on the way other men should live. But we cannot actually master the art and science of right living, as we can master radio transmission and the meaning of the Egyptian inscriptions. I have tried to learn, and have tried to teach other men, the best things I could learn. But all you can do in a mere eighty years is to point folks to a few simple Sermon-on-the-Mount propositions, few, and simple, and lowly, but too great, and vast, and profound for men to master.'

His mind wandered into a path where the thoughts of aged people are apt to travel. 'Really,' he added, 'I suppose it is only when we find ourselves in another world, that we shall know how we should have lived in this one. Well, I am not eager to leave this life, but it will be wonderful to know all that the next life can teach us about living.'

CAN YOU TELL ME?

QUESTION: An American-born woman marries here an English immigrant. She thereby loses her citizenship. In due time, he becomes a naturalized citizen. Does she thereby become a naturalized citizen or must she apply for citizenship?

ANSWER: If married before September 22, 1922, she lost her citizenship and can regain it only through naturalization. Some concessions in the matter of time required to become naturalized are usually made. If married after September 22, 1922, she does not lose her citizenship, nor, if alien born, does she acquire citizenship through the act of her marriage.

QUESTION: What is the approximate national, state, county, city and town and school district bonded indebtedness in the United States?

ANSWER: National, $19,328,174,949.68; state, $240,516,700; county, $206,823,100; city and town, $768,206,200; school district, $174,407,100.

QUESTION: Are there any states in the Union in which a person who is not an American citizen, either by birth or naturalization, can vote for presidential electors?

ANSWER: Arkansas is the only state which does not prohibit voting by aliens. All other states require citizenship except in rare instances where a special law has been enacted to cover local conditions existing at the time.

QUESTION: How can a foreigner who becomes an American citizen bring his father, mother, sisters and brothers into this country from the old country?

ANSWER: His father and mother may come under the quota, with preferential status; sisters and brothers are quota immigrants.

QUESTION: Were there any nickels issued with the Liberty head, dated 1913? If so, how many?

ANSWER: None were authorized or issued.

QUESTION: Was the increase of $20 in pensions to the wives of Civil War veterans beginning August, 1926, allowed?

ANSWER: Under the law passed July 3, 1926, which became effective August 4, 1926, the widow of a Civil War veteran who was married to him during the period of his service in the war receives an increase of $20 a month.

QUESTION: How are presidential electors chosen and how and when do they vote?

ANSWER: By the law of 1845 the electors are chosen in the states, whatever method may be adopted, on the same day, the Tuesday following the second Monday in November. According to the act of 1887 the electors must meet and vote within the various states at such places as their respective legislatures shall direct, upon the second Monday in the following January.

QUESTION: How many countries have joined the League of Nations? Name them.

ANSWER: Fifty-six countries belong to the League of Nations. They are as follows:

Abyssinia	Irish Free State
Albania	Italy
Argentina	Japan
Australia	Latvia
Austria	Liberia
Belgium	Lithuania
Bolivia	Luxemburg
Brazil	Netherlands
British Empire	New Zealand
Bulgaria	Nicaragua
Canada	Norway
Chile	Panama
Colombia	Paraguay
Costa Rica	Persia
Cuba	Peru
Czecho-Slovakia	Poland
Denmark	Portugal
Dominican Republic	Rumania
Esthonia	Salvador
Finland	Serb-Croat-Slovene State
France	Siam
Germany	South Africa
Greece	Spain
Guatemala	Sweden
Haiti	Switzerland
Honduras	Uruguay
Hungary	Venezuela
India	

QUESTION: How many countries have joined the World Court? Name them.

ANSWER: Forty-eight countries have joined the World Court. They are as follows:

Albania	Italy
Australia	Japan
Austria	Latvia
Belgium	Liberia
Bolivia	Lithuania
Brazil	Luxemburg
Bulgaria	Netherlands
Canada	New Zealand
Chile	Norway
China	Panama
Colombia	Paraguay
Costa Rica	Persia
Cuba	Poland
Czecho-Slovakia	Portugal
Denmark	Rumania
Dominican Republic	Salvador
Esthonia	Serb-Croat-Slovene State
Finland	Siam
France	South Africa
Great Britain	Spain
Greece	Sweden
Haiti	Switzerland
Hungary	Uruguay
India	Venezuela

In this department we shall do our best to answer questions concerning Government and kindred matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

QUESTION: Has the League of Nations or the World Court the greater binding power toward universal peace?

ANSWER: There is a wide divergence of opinion on this question. Many members of the Senate think that neither organization has any binding power for peace, but, on the contrary, that they are both filled with war dynamite as far as the United States is concerned, as they would involve us in European affairs. There are others of the Wilsonian type who have great faith in them. The *Congressional Record* contains hundreds of pages of argument on both sides of the question. Any answer to this question would be opinionated.

QUESTION: Has Congress any judicial powers?

ANSWER: Congress exercises judicial functions in two ways. In cases of impeachment the articles are prepared and the trial conducted by the House of Representatives, and the Senate, sitting as a court, renders the verdict and gives the sentence. It is also the duty of Congress to establish tribunals inferior to the Supreme Court.

QUESTION: Did the bill sent to Congress on July 14, 1862, to compensate any state that would abolish slavery within its limits, pass that body, and if so was it approved by the President?

ANSWER: This bill was not passed by Congress.

QUESTION: What is the approximate amount of our annual federal and state taxes?

ANSWER: Latest official figures give the amount as approximately $4,500,000,000. Total taxation, including federal, state, municipal, and county taxes, totaled approximately $8,100,000,000.

QUESTION: What constitutes the seashore, and how much of the ocean can a person claim rightfully?

ANSWER: This is a matter entirely under the jurisdiction of the several states, and is regulated by state laws. These laws vary considerably. An inquiry addressed to the secretary of state of any locality in which you are interested should bring the information you want.

QUESTION: What is the amount of Federal Reserve notes issued from 1918 to 1921? How many of them have been retired?

ANSWER: During the four years from 1918 to 1921, inclusive, $8,843,101,500 of Federal Reserve notes were issued by the Federal Reserve agents to the various Federal Reserve banks and $7,411,943,465 were returned to the Federal Reserve agents for retirement.

QUESTION: What is the approximate indebtedness due the United States on the so-called 'War Debts' of foreign nations?

ANSWER: The approximate indebtedness is $11,799,000,000.

I READ IN THE PAPERS

In his 'Men of Vision,' in *The American Mercury*, Stanley Walker hits the nail on the head. He says:

New York and the Jews

'Of all the sects which battle and sweat for publicity in New York, the Jews are the most insatiable. There are 2,000,000 of them in the city, and their endless enterprises pour out a vast and terrifying flood of press matter, much of which gets into print. The bulk of it, however, merely adds to the work of the Irish charwomen who have dedicated their lives to keeping the newspaper offices free from litter. It is probable that more press material comes from the Jewish organizations in New York than from all other sources combined. The job never has been turned over to a competent statistician, but it seems reasonable to estimate that if all the paper consumed by their press agents could be sold for its junk value alone, enough money would be raised to rebuild the Temple of Solomon, with modern plumbing throughout, and furnish every house in the Holy Land with a new wine press and a carload of matzoths.

'The Jew is both ambitious and sentimental, and upon these two traits the press agent plays for his own profit. Raise the cry, "Fifteen Million Jews Are Starving in Poland!" and the Chosen People begin shelling out instantly, coaxed on by professional campaign managers. The vanity of individuals is also a source of profit to press agents. All manner of Jewish "success" blurbs comes to the newspapers. There is a Jewish real estate dealer who, every time he buys a new building, announces that he once sold newspapers on that very corner. If his press agent is to be believed, he has sold papers on every street corner from Grand Street to Columbus Circle.

'The New York Jews are split into several factions. Some believe that Rabbi Stephen S. Wise is a mountebank; others hold that his words are hardly distinguishable from those of God. Some Jews are hot for the back-to-Palestine movement; others have no more desire to go back to Palestine than they have to work as teamsters in Death Valley. Such differences of opinion create many jobs for press agents. Meanwhile, despite their diversity of views, the New York Jews build hospitals, support a multitude of philanthropies, and aid their unfortunate brethren throughout the world. Thus a large part of Jewish publicity matter is in support of eminently worthy enterprises. But, in general, its bulk and persistence make it a nuisance to editors. Here is a list of Jewish organizations which, over a brief period, have sent press stuff to the New York newspapers, although not all of them have had the services of professional press agents:

The Jewish Sabbath Alliance of America (Agudath Tomchai Shabboz).
The Jewish Survey Commission.
The Bikuir Cholim Convalescent Home.
The United Synagogues of America.
The Federation for the Support of Jewish Philanthropic Societies.
The Home for Hebrew Infants.

The Palestine Economic Corporation.
The Jewish Biographical Bureau.
The Inwood Hebrew Congregation.

The International Jew in 4 volumes: *The International Jew*, Vol. 1, 235 pages; *Jewish Activities in the United States*, Vol. II, 256 pages; *Jewish Influence on American Life*, Vol. III, 256 pages; *Aspects of Jewish Power in the United States*, Vol IV, 246 pages. Price: 25 cents each; set $1. THE DEARBORN PUBLISHING COMPANY, DEARBORN, MICHIGAN.

The Jewish Theatrical Guild.
The Congregation Mt. Neboh.
Young Judaea.
The Hebrew Free Loan Society.
The Temple Emanu'El.
The Society B'nai David.
The Hebrew Day Nursery.
The Palestine Foundation Fund.
The American Committee of 100 of the Yeshivah of America.

'It does not require a Man of Vision to see that there is an excellent profit to be made out of these multifarious desires of a great race. The wonder is that no forward-looking publicist has yet declared himself executive secretary of an Association for the Discouragement of Pogrom Sentiment Among New York City Editors. The suggestion is free.'

Election news in the future may state that the candidate carried the state by so many dollars instead of votes.—*Wall Street Journal*.

Our present-day college students who are impatient at some of the restrictions placed upon them may well be thankful they did not live in Colonial times when college rules were more severe.

Cake or a College Degree

In the 17th Century the corporation of Harvard College, becoming alarmed at the unrestrained commencement celebrations, especially at the consumption of plum cake and other rich foods, passed a vote that 'having been informed that the custom taken up in the College not grateful to wise men, and chargeable to the parents of the commencers (the corporation) do therefore put an end to that custom, and do hereby order that no commencer, or other scholar, shall have any such cakes in their studies or chambers; and if any scholar shall offend therein, the cakes shall be taken from him, and he shall moreover pay to the College 20 shillings for each offense.'

Some years later, June 11, 1722, the continued 'extravagancys' led to an enactment 'that henceforth no preparation nor provision of either Plumb Cake, or Roasted, or Baked Meates or Pyes of any kind shall be made by any Commencer' under penalty of a fine and forfeiture of the 'provisions.'

Cake was still further legislated against in a third act which specified 'that if any, who now do or hereafter shall, stand for their degrees, presume to do anything contrary to the Act of 11th June, 1722, or go about to evade it by plain cake' they shall forfeit their degrees. A difficult choice indeed—a piece of cake or a college degree!

Now if Chicago were located across an ocean, think what a missionary field she would make!—New York *Telegram*.

The other day I met an old and disreputable friend of mine, and he told me about a graft he had worked.

One Treatment Enough

In a western city he advertised himself as Doctor Smithkins, or something, and posted with a local bank $5,000 as a forfeit for every bald head upon which he failed to raise a complete crop of hair within thirty days. The patients paid in advance.

His first 'treatment' consisted of rubbing each trustful bald head with a wire brush until it was red and bleeding. Into the wound he poured turpentine. As soon as the patient stopped yelling, my friend, 'Gypsy Bill,' informed him that with twenty-nine daily treatments just like that he would have a complete head of hair.

Unnecessary to say, no patient ever came back for a second treatment.—Harry Carr in the Los Angeles *Times*.

It's absurd to say the present Senate will do nothing for the farmer. In time it will adjourn.—Louisville *Courier-Journal*.

In Chicago University professors hobnobbed with men from the country 'back of the yards,' stick-up men, murderers, gangsters and others of this class. The occasion was a dinner given in a smart downtown oyster house. The unemployed and down-and-outer were barred. Professor A. E. Holt, of the Chicago Theological Seminary, gave a dissertation on 'society's right to protect itself from the anti-social human being.' This was followed by a speech by an alleged 'enemy of society' on 'what a guy on the velvet ought to know.' 'Honesty is the bunk,' said one man. 'My seventeen months in the house of reform ruined me and I cannot get a job,' said one youth. Five hundred Chicago business men are helping men with prison records to get jobs.

BRIEFLY TOLD

THE EEL WAS AN object of worship to the ancient Egyptians, and the Greeks and Romans considered it a delectable food.

SPLIT INFINITIVES, vigorously blue-penciled by editors, stand vindicated by a noted grammarian, George Oliver Curme, professor at Northwestern University. He says the divided verb form has been used by the best writers for five centuries.

A CENTURY AGO THERE was not a single horse in New Zealand; today the chief sport of the island is horse racing.

BABYLONIAN MERCHANTS SOLD goods on credit 4,000 years ago.

CLOVES, USED SO MUCH in flavoring food, are the dried flower buds of an evergreen tree which grows in tropical countries.

A PASSENGER ON A Canadian railroad sneezed so violently that his false teeth flew out of the train window. A section hand was notified and searched for them on a speeder. Later they were found and returned to the owner.

THE OLDEST MEMBERS of Welsh Sunday schools include one woman 88 years old, with 85 years' attendance, and three other women, each 87 years old, with 84 years' attendance each.

A MICROSCOPE CAPABLE of magnifying an object 12,000,000 times is being used in the detection of disease germs.

NOTES - COMMENTS - CRITICISMS

MR. FORD'S Page this week continues the discussion of 'Everything has been all right, up till now.'

ɾ ɾ ɾ

'If,' that great little word, sums up the theme of Commander Byrd's article on his flight over the North Pole. This word refers to what might have happened if the explorer had had to make a forced landing, and he tells us just how such a contingency might have worked out. Commander Byrd's narrative is an epic of persevering effort and glorious achievement. (p. 1)

ɾ ɾ ɾ

The world's Champion Guesser does not travel with a side show or star it with some vaudeville organization. He is to be found in Washington, and his name is Joseph S. McCoy, Uncle Sam's super-mathematician. When budgets are being prepared, McCoy tells how to tax, what to tax, and what not to tax. He can figure to a fraction how much revenue will be derived. One may call it guessing, but it is the guessing of one who knows. His life story: (p. 3)

ɾ ɾ ɾ

Who would have thought that such a gigantic and successfully consummated project as the Panama Canal would in a few short years prove inadequate for the volume of shipping passing through it? But such is the case. Hence the Nicaragua Canal project. It will be far the biggest ditch in the world's history, just as Panama was before it. Cornelius Vanderbilt, Jr., writes about it and its financing. He also takes us behind some of the desks in Wall Street where intimate glimpses are gained of what is going forward. He likewise throws some side lights on President Coolidge's attitude to things nationally financial. (p. 4)

ɾ ɾ ɾ

One of the greatest of the fine arts is the faking of antique furniture. In it are combined most of the higher arts—painting, carving, engraving and—if you like—poetry; for does not the dealer point with pride, real or assumed, to some masterpiece of faking and say it is 'a perfect poem'? But very often there is far less truth than poetry in this Queen Anne chair or that Georgian settee. The 'antique' furniture manufacturer is a postgraduate in camouflage, and even the globe-trotting connoisseur and museum expert is sometimes deceived. Arthur C. Parker gives us a few realistic sketches of the furniture faker at home. (p. 6)

ɾ ɾ ɾ

Donald A. Laird this week proves how one plus one is really one. It is all summed up in the art school teacher's definition of perspective: 'Perspective is the representation of objects not as they really are but as they appear to the eye.' (p. 8)

ɾ ɾ ɾ

It is often said that some people take their pleasures sadly, but it is not so well known that many persons, while outwardly taking their pleasures joyfully, are inwardly full of gloom. They work hard to have a good time, but conditions are not right. There is something gnawing at the strings that ought to vibrate music and dulling the bright sparks that seek to fly upward. Why is it that the good-time program thus fails to function? Tom Masson gives an explanation. (p. 12)

ɾ ɾ ɾ

In San Francisco there was a successful business man who formed the theory that criminals were made, not born, and worked along these lines in an effort to reclaim and rehabilitate men who could not keep straight. His experience may be summed up in a Shakespearean paraphrase: 'Some men are born crooked, some acquire crookedness, and some have crookedness thrust upon them.' George Henry Parish relates some real life stories illustrating this. (p. 13)

ɾ ɾ ɾ

Europeans charge Americans with materialism, but a European—a Briton at that—declares that it is all the other way, and marshals a number of statements in parallel columns to prove it. His prima-facie evidence is most interesting. (p. 15)

ɾ ɾ ɾ

Going to the 'demnition bowwows' is a Dickensonian phrase put in the mouth of the immortal Mr. Mantalini. 'Going to the dogs' is the more prosaic form of the phrase. This condition is often a reaction from over-repression. But it is rather a misleading expression, sometimes meaning the opposite of what the user intends it to imply. For example, it was much used by the Cavaliers in regard to the Puritans, but the Puritanism of England and New England was a revolt against the license of the age. Sometimes the motive is in the opposite direction. We frequently hear such phrases as 'The revolt of youth,' 'Having one's fling,' etc. (p. 16)

ɾ ɾ ɾ

In 'The Luck of the Hooker *Mary Ann*,' Ivan Swift gives us a story of the northern wilds which he knows so well. In this tale the odor of rum contends with 'an ancient and fish-like smell' and the tang of the Great Lakes. It is realism in its native dress. (p. 25)

EDUCATION does not mean teaching people what they do not know. It means teaching them to behave as they do not behave. It is not teaching the youth the shapes of the letters and the tricks of numbers, and then leaving them to turn their arithmetic to roguery, and their literature to lust. It means, on the contrary, training them into the perfect exercise and kingly continence of their bodies and souls. It is a painful, continual and difficult work to be done by kindness, by watching, by warning, by precept, and by praise, but above all—by example.

—*John Ruskin.*

CHRONICLER OF THE NEGLECTED TRUTH

Coming Home

Edward Davison

THE mists are all gone
And the stars come
out bright,
But I am not alone
As of old in the night.

Were I now but to call
To the window above
It would only forestall
The voice of my love.

Who already has heard
That I come, that I come
Expecting her word
To hasten me home:

Her word from above,
From the heart of the
light,
The word of my love,
My name in the night.

Removing *the* Smoke Screen *From* America's Warships

By E. B. JOHNS

WITH an intense earnestness and a unanimity not evidenced in its proceedings for twenty years, the House Committee on Naval Affairs voted to send Chairman Butler to the President with an appeal for a Treaty Navy. This action was taken because an extended hearing, much of which was in executive session, made four startling revelations as to the condition of the Navy. They are:

(1) That the total tonnage of naval vessels not limited by the Treaty laid down or appropriated for since the Washington Arms Conference by the United States was less than any other power with the possible exception of Italy.

(2) That the construction of the light cruisers according to the Act of 1924 would promote further limitation of naval armaments rather than retard them as suggested in the President's message.

(3) That there is no assurance that there will ever be a conference for the limitation of naval armaments and that it could not possibly take place before the year 1928.

(4) That it is the Director of the Budget, an accountant, who is shaping our national naval defense policy, and not the Secretary of the Navy and his advisers.

Party discipline in Pennsylvania is a controlling factor. In Pennsylvania the President is recognized as the leader of his party and a refusal to follow his leadership is a breach of discipline. It is probably the first time that Chairman Butler has questioned the dictum of a Republican President during his long career in Congress.

Some of the members on both sides of the committee are rated as small Navy men, but as the hearings progressed they lined up solidly in support of Chairman Butler. All of this developed out of an inquiry sent to the Navy Department by Chairman Butler as to why the eight light cruisers authorized by the Act of 1924 had not been built. The Navy Department was evasive in its reply, insisting that Congress was responsible for the delay. Under the act, construction should be started by July of 1927, and while Chairman Butler was insisting that through delays in the Navy Department it would be impossible to comply with the law, there came the President's message with the announcement that the budget estimates did not include appropriations for the last three of the light cruisers. The President said:

'While on the subject of our national defense, it is proper to state that no provision is made in the estimates for the Navy Department for commencing the construction of the remaining three of the eight light cruisers which the act of December 18, 1924, authorizes to be undertaken prior to July 1, 1927. This country is now engaged in negotiations to broaden our existing treaties with the great powers which deal with the elimination of competition in naval armaments. I feel that it would be unfortunate at this time and not in keeping with our attitude toward these negotiations to commence the construction of these three cruisers. Rather do I recommend to the Congress the enactment of legislation

The U. S. S. 'Delaware' in heavy seas.

THE veil of secrecy which was drawn around the Navy in 1922 when the Washington Arms Conference agreement went into effect has been partially drawn aside by the House Committee on Naval Affairs in the sensational hearings which it conducted. It is probably the first time that the legislative branch of the Government has gone to the head of the executive with a report on the state of the Union. This is the constitutional function of the executive department, but as far as the Navy is concerned, the executive department has failed. The legislative branch, through the Naval Affairs Committee, initiated an investigation which revealed alarming conditions according to the unanimous vote of the committee, and these conditions have been reported to the President.

This action is all the more significant when it is considered that Chairman Butler has frequently opposed the recommendations of the Navy Department and has even been charged with having pacifist tendencies.

which will extend the time for beginning their construction.'

This part of the message of the President was far from being satisfactory to Chairman Butler and the members of the Naval Affairs Committee. They decided to conduct an investigation to ascertain whether the Director of the Budget had purposely ignored an Act of Congress and whether there was anything in the act for the construction of the cruisers that was 'not in keeping with our attitude toward negotiations' for the elimination of naval armaments.

Fortunately for the committee, Rear Admiral Hilary P. Jones, chairman of the General Board of the Navy, who was the ranking naval officer at the Geneva Conference, had just returned from Europe. He was the first witness called before the committee, with a view of ascertaining just what had taken place at Geneva.

Admiral Jones attempted to support the Commander-in-Chief of the Navy, the President, in his declaration as to the progress of the conference, but at the same time he was forced to make admissions which did not justify the President's declaration. Under a rapid fire of questions from Chairman Butler and the members of the committee, he admitted that there was really no agreement for a conference. All depends upon further instructions to the delegates to the preliminary conference, he admitted, whether there will be a final or real conference at which anything could be accomplished.

In the course of the questions, Admiral Jones was asked by Chairman Butler: 'What do you think is likely to happen as the result of the Geneva negotiations?' 'I prefer not to prophesy,' said Admiral Jones. 'We hope to reach an agreement for a final conference and that we will be able to extend the Washington Treaty to other ships as it covers capital ships.'

WHEN pressed to state what really happened at Geneva by Chairman Butler, Admiral Jones stated:

'During the conference a fundamental difference developed as to what should be the basis of comparison between the strength of the naval armaments of the nations represented.' He admitted that fourteen powers lined up in favor of the basis of comparison adopted at the Washington Arms Conference and nineteen powers were for the Globas theory. He explained that the Globas theory was a very complicated proposal in which the land and naval forces would be taken into consideration at the same time in any limitation.

Chairman Butler and Representatives Britten and Vinson by a series of questions attempted to force Admiral Jones to make a positive statement as to what was the real attitude of the different nations and what were the prospects of an agreement. Admiral Jones finally said:

'Unless the governments give new instructions there will be no final conference. At the preliminary negotiations, we did not reach an agreement on a basis for comparison. We do not think that we will be able to hold a final conference before 1928, even if we reach an agreement on a basis for comparison.'

Having brought out the extreme uncertainty of the outcome of the preliminary negotiations, Chairman Butler, supported by Representatives Britten and Vinson, sought Admiral Jones' views on the effect of building three light cruisers as authorized by the Act of Congress, on further negotiations.

'Is it your judgment,' inquired Chairman Butler, 'that an attempt to bring our cruiser fleet up to where it should be in the judgment of military men, would in any way embarrass further efforts to be made to secure limitation of armaments?'

To this, with reluctance, Admiral Jones answered:

'On the contrary, I think it would have a good effect in any conference that we should enter.'

Mr. Vinson: 'Now, Admiral, from your experience in the preliminary negotiations, do you think we would be in a better position to bring about a general disarmament if this cruiser program of 1924 was commenced and nearing completion?'

Admiral Jones: 'I will start out by saying that Great Britain, Japan and ourselves were earnestly desirous of finding some formula for carrying out the reduction. With this cruiser program completed, we would be in a better position before the conference and would have a greater influence in bringing down the level of armaments.'

Mr. Britten injected:

'Did you in your conferences with British representatives hear them suggest the scrapping of any part of the great fleet of British cruisers as we did our battleships in the interests of peace of the world?' (*Continued on page 23*)

[1] Does not include tonnage of 2 submarines.
[2] Does not include tonnage of 4 gunboats. No data available as to tonnage.
[3] Does not include tonnages of 1 repair ship and 1 submarine tender. No data available as to these tonnages.
[4] Does not include tonnages mentioned in (2) and (3).
[5] These are combined mine sweepers and mine layers.
[6] Includes 1 ex-Austrian tanker added to Italian Navy in 1923.
[7] No information on Italian ships appropriated for but not building.

Use Your Hands to Save Your HEAD

By DONALD A. LAIRD

MY HUSBAND may make students think he knows physics,' a tattletale professor's wife informed a group in a superior way, 'but he can't even fix the cistern pump!'

What he read in a book he could reel off by the hour. So everyone thought he knew physics; that is, everyone except his wife and a firm which had been impressed by his lectures and engaged him as a consultant to work on the physics of a manufacturing problem they were up against. He worked for them—for a short time.

The books would not help him on this job, and he could not use his hands to save his head, or to save his new good-paying job.

I told this incident to a small group of industrial executives in Syracuse recently. One of them, a graduate in engineering from a well-known eastern university, spoke up with great fervor in his voice.

'Nobody knows that better than I do,' he said. 'I graduated with highest honors from the ——— scientific school. I had my pick of the jobs at commencement time. Six weeks was the longest I held a job the first three years after I graduated. I knew engineering cold from the books, but I couldn't *do* a thing.'

He knew everything in the books, but he could not use his hands to save his head. It took him fully ten years to find out from hard and cruel experience that after one is out of college it is what the hands have stored up in them that counts.

Just yesterday I received a letter from an executive who is with a large oil company. It was in response to an inquiry I had sent him about the college he had attended. Here is his reply:

Dear Doctor Laird:

At least I have a home town, San Antonio, although I haven't lived there since 1917.

As to education: I have only had three years and three months of formal education. Three of these years were spent in the San Antonio High School. The three months were spent in the University of Texas. That, I believe, ranks me about a total illiterate.

This is my reply which went in the return mail:

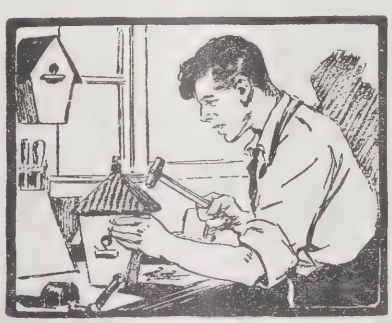
Dear Mr. ———:

Be yourself! You have probably forgotten more valuable practical knowledge than the college graduate is willing to absorb the first dozen years after he graduates—it usually takes them that long to come down to earth and find that their hands are as important in the work of the world as their heads.

We have two eyes with which to absorb book knowledge. *In each arm there are hundreds of thousands of eyes which are far more effective in gaining a knowledge of things* that will work, of how to do things.

The professor of physics had not discovered this. Neither had the executive I met in Syracuse—until after ten years of disappointing experience. The executive with the oil company had found it out, and his meteoric rise shows how the hands can save the head.

Helen Keller was a southern girl who was made blind, deaf, and dumb by a childhood disease. She had her hands with which to master the world. Using *the thousands of eyes in each arm* she became more accomplished and more a master of her world than the graduates of eastern girls colleges.



Laura Bridgman was another.

Schools are beginning to acknowledge that the muscle senses are a basic channel through which to educate. First came laboratories; then manual training; then all sorts of industrial activities. Then they changed—in some progressive schools—physics laboratory from a place where things were done according to routine, foolproof directions in a red, cloth-covered book to a place where they *made* things. Here is a press clipping from the New York *Times* about such a class:

'Every boy of the twenty-five hundred who attended the public school at Broome and Willett streets was fired with admiration and interest when two diminutive Edisons from their ranks set up a telegraphic system, operated by wet batteries of their own construction and stretching four hundred feet through the school building from one room to another.'

That such a common-sense method of *letting the boys learn* physics *through their hands* should constitute news is a reflection of the widespread and justified belief that the hands can save the head in mastering one's world.

The challenge to the schools is greater because the one factor in the life of our grandfathers which gave many of them an education superior in working qualities to the formal education many schools now give is rapidly declining, due to the movement away from the farms.

There is, for instance, the boyhood record of G. Stanley Hall. Dr. Hall studied experimental psychology under Wilhelm Wundt, who founded the first psychological laboratory in the world at the University of Leipzig scarcely half a century ago. When Hall returned to the United States after his study abroad he was soon called to establish the first psychological laboratory in America, at Johns Hopkins University. And when a wealthy New Englander wanted to start a college where students *learned by doing*, he called Hall to organize and become president of Clark University.

The psychological students Hall trained are now the leaders in psychology. Why? Hall trained them by *having their hands help their heads.* They did things. They started where the books left off, while other laboratories were clinging fast to books.

Hall was a farm boy. It was there he received his real education in using the senses in his muscles, tendons and joints. He said of his boyhood:

'. . . trees were chopped down and cut by two men working a cross-cut saw, which was always getting stuck fast in a pinch which took the set out of it, unless the whole *(Continued on page 27)*

Churches *Are* Building SKYSCRAPERS *From* Coast *to* Coast

By WILLIAM L. STIDGER

Drawing of the Broadway Temple, New York City, accommodating apartments, dormitories, offices and stores in addition to the auditorium and other church facilities.

A FOREIGNER, coming into New York Harbor recently, pointed to the Woolworth Building and remarked, 'That is your cathedral!'

He was mistaken, but when he comes again he will see not only several cathedrals in New York, built on the plan of the skyscraper, but one in every great city in the United States from the Atlantic to the Pacific.

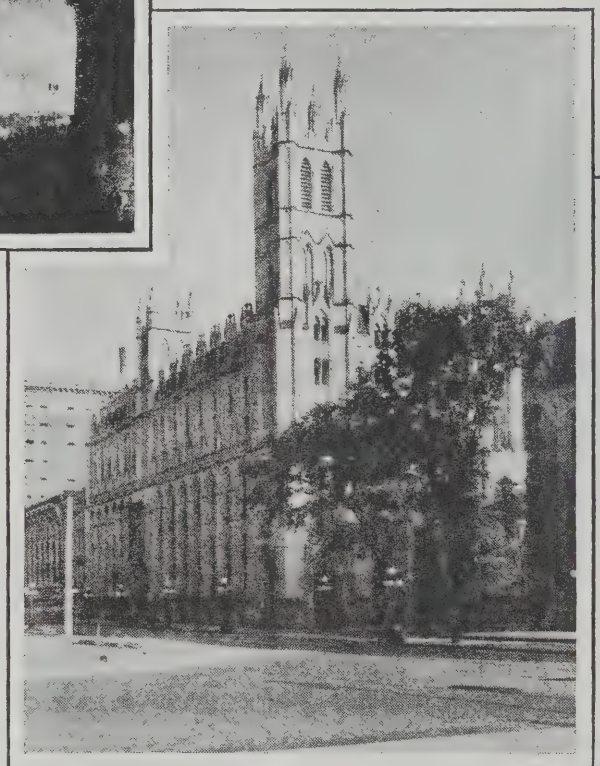
What has brought about this new architecture?

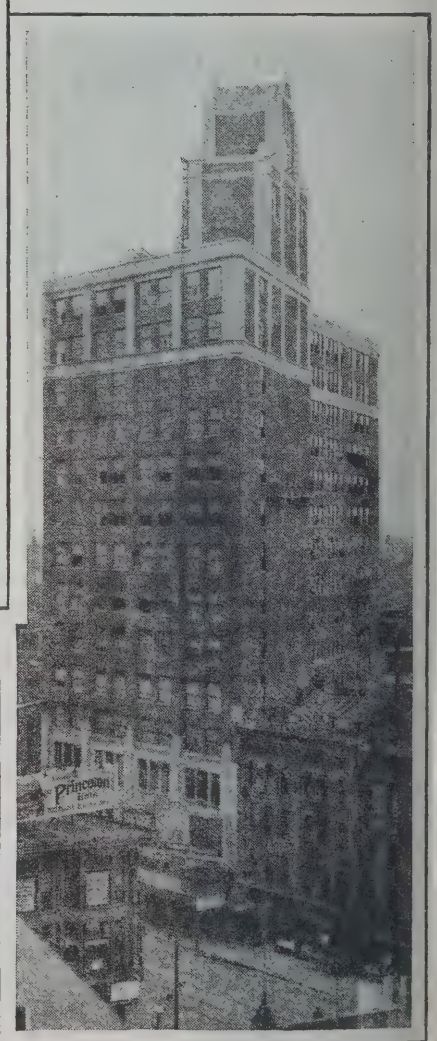
First it has come to be a necessity because, in the downtown locations, with few exceptions (and these exceptions are when a church is located on a public square), great dominating skyscrapers build beside the diminutive churches and make them look like puny dwarfs. It is needless, as churches which have had such experiences have learned, to protest or to try to offset this imposing neighbor. He is there to stay. He makes the church look like a playhouse. Sooner or later the psychology will kill that church, and it will either have to move out, or build a skyscraper temple tower to hold its self-respect and the respect of the world.

The ordinary Gothic type of church, or cathedral type, needs much open space around it to make it impressive. In its day it was called 'the aspiring architecture.' It pointed the eyes of people, through its spires, skyward and God-ward. But when it is set down in the midst of gigantic modern city office buildings it no longer retains the power to teach aspiration to weak mortal minds. It looks puny. Therefore the first cause for the building of these temple churches is that of necessity; the necessity of keeping self-respect; the necessity of staying in the downtown location.

The second cause is financial. Property becomes so expensive that it is impossible for the average downtown church to survive if it retains the old type of architecture. If it builds a skyscraper church, and has office buildings to rent, it can not only maintain its own enterprise, carry on its own Christian service, but it can finance the missionary work of the city in which it lives and promote missionary work abroad. This has been the experience of the skyscraper church. Not one has failed. All have become financially independent.

Summed up, the two reasons for building skyscraper churches in modern American cities are comprehended in one word, necessity. They must either abandon the old type of architecture and make (*Continued on page 27*)





Mizpah Temple, Syracuse, New York, with hotel accommodations, under supervision of the First Baptist Church. Right—The Baptist Temple, which dominates the downtown business section of Rochester, New York.

The Conquest of MIDDLE AGE

By THOMAS L. MASSON

THERE are in this country, at the present moment, at least ten millions of people—men and women—who, having arrived at middle age, are wondering what to do with themselves. They have lived what a considerable proportion of them believe is the best part of their lives. They are looking forward with resignation to old age. Metaphorically, they have thrown up their hands.

Some of these people have achieved material success. They have enough to keep them the rest of their days. But even at that, they don't know what to do with themselves. A year ago a man in this position wrote a long letter to a New York paper. He was over fifty. He had retired from business. The only thing he could think of doing was to spend the rest of his life in travel. He wondered whether that would be best.

I knew another man who, at the age of forty, retired from business with a considerable fortune. He began thus to travel. He was always on the go. No sooner would he encircle the globe than he would start all over again. He knew every principal geographical spot in the world. He had picked up a knowledge of a score of languages. He was what is known as a cosmopolite. As a matter of fact, he knew very little. He had been everywhere, seen everything, and couldn't sit still. He had a fatal disease—the disease entitled Man-afraid-of-himself. It is not uncommon, even among the most intelligent people.

The other day I saw a photograph of one of the world's most famous women. Her age was fifty-two. She was therefore middle-aged. She was very fat, her weight, I should say, about two hundred pounds. Beside her was a slim youth, his age being twenty-six. She had just married him. Why? Because, even if the world had handed her some of its best bouquets, she still sought for that urge of all souls—the spirit of romance. How many examples are there of women like that who, at fifty, find themselves in possession of fortunes, and 'nowhere to go but out'? So they marry these young fellows. Lonesomeness is the curse of humanity. Yet, singular to say, lonesomeness, if rightly managed, is the greatest gift of the gods. It depends on what you do with yourself inside.

Recently I held a conversation with a very able woman whose age was about fifty. She held an important executive position, at a salary of at least ten thousand a year. She said to me: 'In a few more years it will all be over.'

'Just what do you mean by that?'

'Well, the heads of all big corporations demand that the women employed shall be well-dressed, peppy, and youthful. While my job is important, they can always fill it. I know what is going to happen to me.'

'But,' I pursued, 'how about your family?'

She smiled.

'You know perfectly well how it is with families. Mine is scattered, each has his or her own interests. I live in a small, well-furnished apartment. I have a few friends, but most of my time is passed in earning a living and saving enough for old age. I enjoy my work now, but recognize that in a few years I will be on the scrap heap.'

I could go on and multiply these instances indefinitely. We all know about them. Many who read these lines will see things that will remind them of their own circumstances.

LET us not forget,' remarks Frederick Pierce, 'that the inability to stand defeat is essentially an evidence of inferiority, either of constitution, or training, or both. But let there be no discouragement in the recognition of this. Disappointments in life are inevitable; but almost anyone can learn, first, to analyze them so as to absorb the lessons which they contain, and second, replace them with forward-looking, constructive ideas of the future.'

Now there are two things which have recently been pretty well established by experience, and exploited by the authorities. One is that we never live up to our energies, and the other is that a slight change in our attitude will often produce enormous changes in the total content of our lives. For instance, a woman—like some of

Even superficial observations show us that youth is more ailing than middle age.

those indicated—who at fifty is dragging out a miserable existence will suddenly 'get an idea' and from thenceforth live a transformed life.

I met such a woman two years ago at a public banquet. She was a very large woman. She had met with an automobile accident, very serious, some years before, and had become a semi-cripple. She had two young boys on hand, and her husband collapsed. The accident gave her time to think for herself. On getting up on her feet—she still went on crutches—she conceived the idea of going into business. At the time I met her, she had both boys in college, and was as full of 'pep,' if not a good deal more so, than any flapper I have ever met. She made a speech and aroused the utmost enthusiasm.

THE well-known case of Nellie Revell is now a classic. She had a fine job as a theatrical agent in New York when she met with a bad accident. The doctors all gave her up. She was in the hospital for years, barely alive, a professional cripple. She had acquired the reputation for being a hospital saint—that is to say, a woman who never complained, adored by all the nurses. Miss Revell in her book (*Fightin' Through*) tells about the other saints in the hospital, and how one day, in thinking about them, she discovered that none of them got well. They just lingered on, getting no better. It occurred to her that this stand-pat attitude of saintship was keeping them back.

She determined to assert herself. When the nurse came in with a tray of food, she put up a kick about the plate and chop being cold and knocked it off on the floor. Fancy the surprise of the nurse at having one of her saints kick up like that! Well, Miss Revell dated her recovery from that moment. She was no longer a jellyfish. She had discovered that the cure for everything lay in herself. Now she is doing her old job again, better and peppier than ever.

It is not, however, by being too radical, or too sensational that we necessarily achieve the victory over our environment. In 1921 President Coolidge, then Vice-President, contributed to a magazine a series of articles entitled 'Enemies of the Republic.' James Harvey Robinson, in his provocative book *The Mind in the Making*, quotes from one of these articles by Mr. Coolidge as follows:

> Adherence to radical doctrines means the ultimate breaking down of the old, sturdy virtues of manhood and womanhood, the insidious destruction of character, the weakening of the moral fiber of the individual, and the destruction of the foundations of society.

It is very doubtful if, during the past few years, the national craze for sports, revealed in the huge stadiums and the excited throngs gathered before bulletin boards, is contributing anything to the stability of the American people.

In one of his best chapters, that on Repression, Professor Robinson writes:

> If only men would come to look at things differently from what they now generally do, a number of our most shocking evils would either remedy themselves or show themselves subject to gradual elimination or hopeful reduction. Among these evils a very fundamental one is the defensive attitude toward the criticism of our existing order and the naïve tendency to class critics as enemies of society.

NOW while that is undoubtedly true, I might remark in passing that for this condition the critics themselves are largely to blame, for their criticisms have too often been based upon faulty and inaccurate thinking. For example, during the war extensive intelligence tests, conducted by well-known 'authorities' and widely disseminated, declared that a very large proportion of the American people (particularly among the enlisted men) had the intelligence of a twelve-year-old. In some cases, as that which follows, the authorities were not only misquoted, but their conclusions very badly garbled by writers. In his book, *Mind and Heredity*, Vernon Kellogg, the eminent biologist and permanent secretary and chairman of the Division of Educational Relations of the National Research Council, writes as follows:

> Dr. Yerkes, recently, in the *Atlantic Monthly*, quoted from a writer in a magazine of different type

(*Continued on page 25*)

Right romance does not begin until middle age. The cubs know nothing of it.

The Lustrous LENGLEN

By H. G. SALSINGER

SUZANNE LENGLEN, the flying French demoiselle of the sallow complexion and the wide gray eyes, demanded and received $100,000 to leave the amateur ranks of tennis and become a professional.

It seemed a steep sum for any promoter to pay even to a girl who was the recorded queen of tennis from Melbourne to Wimbledon, but before she played her first professional engagement this promoter, Charles C. Pyle, had already received nearly $100,000 for Lenglen by-products and since he receives $5,000 as a guaranty and the main percentage of all gate receipts over that sum wherever the tennis troupe which Mlle. Lenglen heads gives an exhibition, the venture was assured of financial success at its start.

No other amateur athlete has ever been able to command so much money to turn professional, and no other amateur athlete, man or woman, could possibly be given an amount anywhere near $100,000 with a chance of the promoter breaking even. The fact that Mlle. Lenglen got that much money and the more remarkable fact that the man who paid it to her made as much, if not more, out of the investment than she herself received, develop a number of questions concerning this girl who is without question the greatest tennis player her sex has developed.

Mlle. Lenglen is more than a great tennis player. She is the polished mistress of her craft but she is likewise a girl of style, mannerisms, color, fascination, grace and individuality. She has successfully linked that rare combination in sport—skill and personality. And, what skill!

HER career in tennis as an amateur was a succession of triumphs. From the time she won her first major title she continued winning major titles without losing a set until the day when she decided to cash in on her vast reputation. In her home at Nice, the gift of grateful Frenchmen to her father, who was also her instructor, are more than 150 trophies, representing the court victories of the scintillating Suzanne. No other champion in tennis, man or woman, has a record to equal hers.

Her father began teaching her before she reached the age of ten and the method of this teaching explains much of the success she achieved. Père Lenglen marked off a tennis court into eighty squares. All these squares were numbered. Then he would order Suzanne to drive the ball into the square he called. Hour after hour and day after day he would compel her to take this monotonous practice. The ultimate result was uncanny accuracy in Suzanne's play.

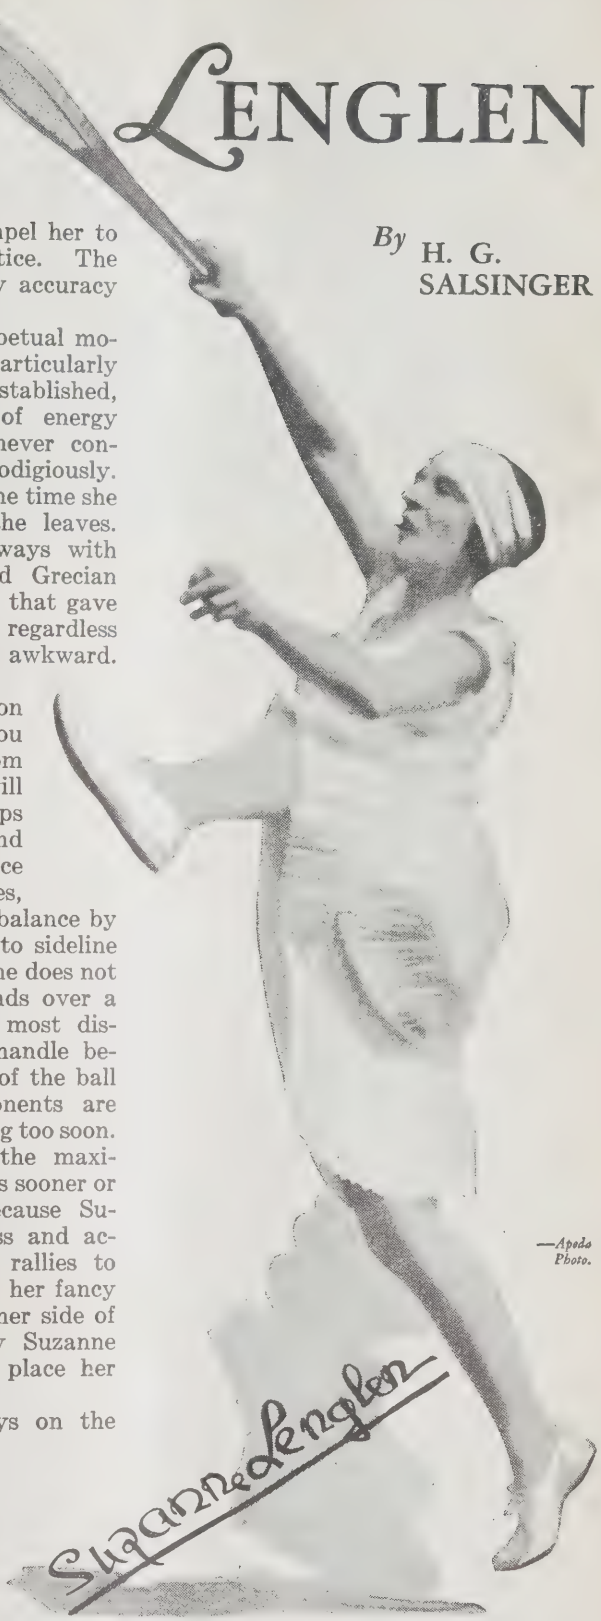
On the courts she is perpetual motion. Many athletes, particularly those who have become established, practice the conservation of energy and relaxation. Suzanne never conserves energy; she wastes it prodigiously. And she never relaxes from the time she steps on the court until she leaves. She keeps moving, but always with perfect poise. She studied Grecian dancing for a few years and that gave her grace. Her movements, regardless of how sudden, are never awkward.

MLLE. LENGLEN works on the theory that as long as you can prevent your opponent from getting set for strokes you will have the advantage. She keeps opponents on the defensive and because of her ability to place the ball in any spot she desires, she keeps her opponents off balance by running them from sideline to sideline and from back line to net. She does not hit a hard ball and she sends over a slow one at times that is most disconcerting. It is hard to handle because she takes the life out of the ball by superb control. Opponents are generally tricked into swinging too soon.

Being forced to cover the maximum of court area, opponents sooner or later become exhausted because Suzanne, due to her steadiness and accuracy, is able to prolong rallies to almost any extent that suits her fancy and when the girl on the other side of the net becomes leg weary Suzanne finds it an easy matter to place her shots for points.

Suzanne is nearly always on the balls of her feet. Throughout a match she is literally on her toes. She is in position to go after a ball in any direction. She starts quickly and moves faster than any woman she opposed during her career. She can return any kind of ball, forehand or backhand, and she has a change of pace.

Her court generalship is unusual. She mixes the length of her shots and changes direction with disconcerting suddenness. She catapults around the court, making one spectacular get after another. She measures her strokes to the inch. She jumps, lunges, whirls, but always with catlike grace and machine-like steadiness.



—Apeda Photo.

Suzanne has often been referred to as a 'pearl without price to France.' She has been more to tennis. She has brought to the galleries men and women who would not have come otherwise. She brought Queen Mary of England to the courts at Wimbledon last summer and kept her waiting half an hour. Only a Lenglen could do that. She gave color, interest, excitement and brilliance to even the dullest of matches and she (*Continued on page 27*)

News Out of WASHINGTON

By AARON HARDY ULM

SOME day when there is nothing else to do I am going to write an article showing that the City of Washington, District of Columbia, is not in the United States. Along with other items of supporting evidence, I expect to list a series of recurring announcements of the 'discovery' of this removed and unknown capital of the nation.

A current announcement of that kind lies before me. It is put forth, by a well-known periodical, with a flourish that would not be excessive did the promised 'discoveries' have to do with the North Pole, the Amazon Basin, or the Sargasso Sea. At last—or rather again— a route to the 'real' Washington has been hewed out. And as a result there are to be put forth 'the real facts which the general public never gets, information that other papers may know but do not print' about what goes on in the 'real' Washington. Certainly a bold adventure by daring explorers!

One may wonder what that large army of exploring people always in Washington thinks about it. Probably nothing; to that army it is old stuff. There are in Washington approximately five hundred full-time writing people who serve directly a thousand or more publications. Add the publications that are served through the press associations or syndicating services and the number will go 'way up in the thousands, including every known grade and shade of opinion and purpose.

There are in Washington perhaps one thousand persons, in addition to reporters and regular correspondents, who help to sustain what, next to Government, is the city's leading industry. Some of them, free-lance writers, are circumscribed only by the reading demands of the public—and not always even by that. Some are officials who write for publication on the side, or make ready—as a large percentage of them do—to take the public into their confidence upon leaving office. Some are Government employes with spare time and a flare for the pen or typewriter. Others are publicity men whose business it is to provide material for others who write, and to send free copy directly to publications throughout the country. A hundred or so of these are employed by the Government itself.

So if the 'real' Washington and what goes on therein is not regularly presented to the country through the public prints, the fault surely is not lack of facilities.

This writer once made an inquiry as to the volume of 'copy,' that is, written or wired manuscript intended for the public prints, that goes out of Washington daily. It was found to be so huge that only rough approximations could be made. The press associations alone send out from Washington around 50,000 words of news copy every day. This would fill fifty or more columns of newspaper space. Since every important item of news is covered by each association, much of this is duplication. But the sendings of the Associated Press alone probably would fill a newspaper page every day, and frequently much more. All the bureaus and special correspondents maintained there by newspapers send out all told several times as much as the press associations. Much but not all of this is duplication.

Many thousands of words are sent out every day by writers for trade and other special publications. There is little duplication in this. Add the outpourings of special writers and publicity men and you will have a spectacle of mass as well as individualized production of news information in Washington. The gross output is probably not less than 500,000 words a day. A very large proportion is published. It would seem that the 'real' Washington and what goes on therein could not escape an outgoing flood of such big proportions.

YET there is a rather general belief that the 'real' Washington and what goes on therein does in much part escape, that there are quantities of information which the public never gets. Hence the recurring announcements like that aforesaid.

This one, like most of the others, is quite convincing and no doubt is a prelude to much that will be interesting. It may depend on the 'slant' taken by those who do the disclosing. Whatever its special classification—factual, investigatory, satirical, analytical—the 'slant' no doubt will partake of a characteristic common to that always taken by explorers of the 'real' Washington. This is a viewing of the capital as a place removed, mysterious, Machiavellian, to an extent beyond the common ken of the country.

In some senses Washington is removed to the point whereby a good case could be made out for the claim that our capital is really not in the United States. It is cut off geographically from the other (*Continued on page 24*)

MR. FORD'S PAGE

OF THE DEARBORN INDEPENDENT

THE American people are not warlike and have an intense repulsion toward national bullyism in any form. They do not maintain an army to serve as an auxiliary of commercial exploitation, nor a navy to do the bidding of international bankers. On the contrary, the American people like to think of American business as the ambassador of understanding and good will among the nations whither it goes, and not the forerunner of strife and intervention and subsequent domination.

It is true that with the general approval of the world we have established ourselves as the strong friend of the liberties of all the American nations, north and south. That gives us a responsibility which we cannot shirk and involves the exercise of a certain wise and disinterested oversight, especially with reference to any designs which non-American powers may have upon the Pan-American republics.

But it seems that we have exercised that oversight in a manner that has raised serious misinterpretation of our motives. Such a condition, of course, is not single in its cause. A considerable part of it is due to the character and methods of private enterprises in the nations south of us. Bankers have inveigled some of these countries into burdensome loans, even, it is said, with the assistance of government pressure. Commercial adventurers, in many instances, have conducted themselves like pirates, for the exploitation and not the development of the countries and peoples into which they have gone. Individuals here and there, not realizing that they were representatives of all of us at home, have given our neighbor nations strange views of what sort of people we are. We have not always considered the dignities of the peoples from whom, as a government, we have attempted to collect the private debts of private concerns; and there has been too frequent a recurrence in the press of 'Marines have been landed' on missions which we as a people knew nothing about and could not defend to the accusations of our own minds.

The result is that we have been too often unnecessarily obliged to adopt an attitude in the absence of facts; either the attitude of condemning our national action out of hand, or of sustaining the government in all it does, however grave our doubts may be. But the stronger tendency among our people has been to disapprove of all threats or movements of force upon our neighbors. Americans are, of all people, the readiest to call a halt on any sudden use of force. And this, though it indicates a certain prejudice in favor of fairness, compels opposition to Government, which is a bad thing for any nation to have to do. Lack of confidence in Government is a bad thing for any country.

Add to this the unceasing efforts of certain European nations to encourage a suspicion and dislike of the North Americans, and there results a condition which may be said to create the very situations which necessitate our Government making certain moves, but which may be better said to make it more incumbent on our Government to show by superior fairness and good will that our interest is to be preferred above that of others.

> *IF THE Marines could be landed sometimes to haul out of Central and South American republics the type of American business man that leads to war, it would give the United States a better setting in the eyes of the world. Yank them out and send them home where we can take care of them. Then we should read with less doubt and fear the increasingly frequent news, 'The Marines have landed.' Let them land on the right people, the people who bind the little nations in loans, and exploit them in commerce, and mislead them in industry. Let the Marines be the agents of the American people and not a special police on behalf of the interests.*

We have the Philippines and Cuba as examples of excellent original motives being obscured and distorted by the after results. The too obtrusive result of our entrance into those places has been the opening it gave to some of the worst phases of our exploitive commercialism. It is inevitable that trade should follow the flag, but it is not inevitable that the flag should stand as the symbol of protection to all sorts of misdealing. To release an island from the rule of an over-sea tyrannous system, and then shackle it in bondage to an equally tyrannous money system, is not improving matters. It makes money, but it does not increase national honor.

If our Banners are Sugar and Oil and Loans, let us say so at once. If it is impossible for a nation like ours to deal in scrupulous generosity with the people we have undertaken to protect, if all our protestations of disinterested humanity are purely for popular consumption, let us have it understood. It were better so, for it must be clear to every one now that the things prepared for popular consumption are not being swallowed. In any case, let the reasons given for our action be truthful ones, and *let us see the men and the interests*, who they are, for whom 'the Marines have landed.'

America has plenty of business men among her South and Central American neighbors for whom no Marines were ever needed.

As a people we are lamentably ignorant of the problems of Pan-America, but we instinctively know that landing the Marines does not make for better neighborliness, and we are equally certain that business which creates the need of Marines should be summoned home. It would be a fine spectacle for the world if some day the Marines should land and wind up some lines of business which make for war, and send their managers home.

'Ford Ideals,' 452 pages, cloth bound, contains 98 of these articles. Postpaid $1.00.

EDITORIALS

OF THE DEARBORN INDEPENDENT

Are You Aware—?

THE United States has spent more than a quarter of a billion dollars in complying with the provisions of the Washington Armament Limitation Treaty. The exact net expenditure in junking part of the nation's battle fleet was $277,696,994. The estimated expenditure for Great Britain is placed at $169,939,567, and for Japan, $106,796,300. The figures were recently supplied to Congress by the Navy Department, at the request of Representative E. R. Ackerman of New Jersey.

'I believe that Americans should be made aware of the dollars-and-cents cost of our participation in the disarmament conference,' Mr. Ackerman told his colleagues. 'The figures show that we destroyed *new* property to the value of $142,000,000 in order that we might keep faith with the other powers in our agreement for disarmament. We ought not, it seems to me, put ourselves in the position where we might have to do this again in the near future, without full consideration of the cost to the taxpayers.'

He believes that 'Americans should be made aware,' does he? So do we. But *are* they aware?

Will for Secretary

WE RESPECTFULLY suggest to the Government the appointment of Will Rogers as Secretary of State for Pan-American Affairs. We are just as serious about this as Will Rogers is in whatever he may say, and Will is one of the really serious men in our public life. If you have noticed it, all of his topics are serious and all of his comments are philosophical. The laugh that follows is the human spirit's gay reception of a Wisdom which statecraft and other professionalism exist to suppress. True wisdom is gay; it's ignorance that makes us dull and sober. In a truer sense than we have realized, our real humorists are our wisest men.

Will Rogers is the only man who ever went to Europe and said his straight American say about the war debts and left the debtors feeling better for it. All other spokesmen left them feeling bitter. He is the only man who ever sent back 'inside stuff' that is absolutely true.

So, Will should be pulled off his present work of instructing the American people at one-night stands, and sent down to pacify Nicaragua, returning via Mexico. He can straighten out all misunderstandings single-handed. He doesn't know how to talk as Oil, Sugar and Loans do it, but he knows how to talk like an American. And we have missed that note from diplomatic discourse of late.

One danger, of course, is that Will might set us laughing at ourselves. Yet our State Department has often been very solemnly funny in a stuffy way which, because of its inability to laugh, has sometimes left it in a bad way.

One advantage of Will's connection with the State Department as Secretary for Pan-American Affairs would be that a folly could be dispelled in laughter privately before it attained the dignity of an Administration Policy. This would ease the strain on Senatorial tempers and save the nation's nerves.

Charlie in Realistic Role

THE next Front Page Show of the Moron Movies is about to begin. A Big Double Bill—'Peaches' and Charlie—headliners both. And there will not be a new line in either act, not a line. Every pertinent question is already answered by the interested public: why did Lita marry Charlie? why did 'Peaches' marry old man Browning? These being answered, everything is answered. Trials and interviews and confessions cannot possibly educe a single new element. And yet the deluge will overwhelm the great American press; our best writers are already getting ringside seats; and the press agents of both sides are putting up experimental barrages.

In Charlie's case, of course, the possible outcome is serious. He is fighting for his place in pictures, and there are wise men in filmdom who say that he is in danger of losing it—that a man cannot be protected against his folly forever. Lita appears to have been his 'once too often'—she had a family that could fight and figure at the same time. Marriage temporarily prevented the threatened scandal; it was at a time when Hollywood could not afford another scandal under any circumstances. But now the armistice with fate is over, and the deluge is here. It appears that Charlie had a number of matters hanging over his head, income tax arrears and the like, and all crashed at once. And Lita's lawyers seem to have overlooked nothing.

However, to those who know they cannot escape the deluge of newspaper slush, and yet would weather the period as cleanly and comfortably as possible, the suggestion may come with grace that a virtue be made of necessity and the whole matter be turned into a Study of Propaganda. This fight, being primarily for Charlie's place in the films, is going to be carried to the public. Only public opinion can hold that place for him. And the struggle for public opinion has begun. Its strategy will be worth observing. First, the almost unheralded flight to New York City, with premonitory wails of woe at Chicago, as Charlie vainly tried to avoid publicity. Then the hectic confession in New York, the dear man's love for children, and his serious experiments to de-

termine whether nature had endowed him with paternal powers—a really tear-compelling recital, poor man! Then the nervous breakdown, so sudden and so mysterious. And now the dramatic refusal of the comedian to have any women around him, not even a woman nurse, because the sight of one brings too poignantly to mind the perfidy of the sex!

What the next act will be, is not known at this writing, except that there certainly will be one, and then another, and so on, a 'continuous show,' until Lita is settled with in some fashion or other.

This, then, is the only safety we see from what is coming—study the matter as an early 20th Century method of slugging the movie mind of the United States. It will also be opportune to study the dignity and fairness of the United States press. In other words, Charlie and Lita are merely incidental—the bigger game is the Public.

Army Grub

TWO illuminating bits of information come out of Washington:

> More than 15,000 men deserted from the United States Army during 1926—a desertion rate equaled only once in the past forty years.
>
> The food ration for the Army during the year was 35 cents per day per man.

It is obvious that the two are related. General Summerall, Chief of Staff, recently told Congress that private soldiers get only one good meal a day. How the Government expects the Army to keep its men in good health and spirits at a cost of little more than a dime a meal passes the understanding of the ordinary householder. Yet not only does the Government expect that, it *demands* it: and the officers are held responsible for maintaining the morale and the loyalty of their men.

There is flagrant unfairness in the treatment accorded the Army. The Navy and the Marine Corps have a ration of approximately 55 cents. But in the face of this, the Director of the Budget cut the Army *subsistence appropriation* from $20,000,000 to $18,000,000. The Army is honestly following the Administration's program of economy. Through the selling of waste material and through other devices it saved more than a million dollars in 1926. The money, however, reverted to the United States Treasury, where it became fused with other general funds and did not benefit the Army.

Many Army posts cannot buy their supplies through the quartermaster; they must make individual purchases from local stores, at prevailing local prices. They cannot spread 35 cents over a very generous portion of food, and it is frequently necessary for soldiers to spend a large part of their meager $21-a-month salary for the food which their Government should supply them. A condition under which more than 15,000 men voluntarily become criminals and fugitives from justice in one year demands speedy remedy.

Deporting Aliens

THE views of those persons who oppose the Alien Deportation Bill are interesting. Ernst Freund, for instance, a director of the Civil Liberties Union, questions what he terms the 'moral right' of the United States to deport undesirable aliens. He says:

> That may be an interesting question, and some time it may be submitted to the World Court. Your provisions may be all right from the standpoint of American constitutional law, but will they stand scrutiny if we get away from our particular Constitution and our constitutional law and ask whether this affirmative burden of proof is really in accord with the universal law?

Getting 'away from our particular Constitution' appears the chief aim of those who would be most affected by the proposed law. There are more than one million foreigners unlawfully residing in the United States. The rapidly increasing number of alien criminals and insane presents a serious problem. The existing law is inadequate. Yet such powerful influences are arrayed against the Alien Deportation Bill that the chances for its enactment during the present session of Congress are held to be slim.

During Chicago's reign of terror last year when that city was virtually at the mercy of alien gunmen the Government rounded up hundreds of undesirables and issued deportation warrants against them. Because of flaws in the law it was possible to deport only eighteen—fourteen to Mexico and four to Italy. The remainder were released. The Alien Deportation Bill would tighten the Government's rein on these undesirables. It would extend to *seven* years the period within which an alien may be deported for becoming a public charge, or for being mentally defective. It would extend to *ten* years the period within which an alien may be deported upon conviction for a felony. It would remove altogether the time limit for deporting an alien convicted of a second felony. It provides for deporting habitual alien criminals who have escaped with sentences of less than a year but whose aggregate sentences total eighteen months or more. It retains the section of the present law making deportable those who advocate anarchy, or the overthrow of the Government by force.

All these provisions seem fair enough. Law-abiding aliens have nothing to fear. To the contrary, the bill seems designed in their favor, for it would legalize the status of those aliens who entered the United States illegally prior to July 1, 1924, who have been obeying the laws of the nation since that time. But such lenity is not enough to satisfy our internationalists. They are above American law and the American Constitution. Only 'universal law,' whatever that is, is good enough for them.

When FRANCE Got Back *Her Favorite Daughter*

Alsace *the* Lovely

By A. M. SOMMERVILLE STORY

Thann, Alsace, is one of the most beautiful villages of France with traditions and customs of its own, and an art, architecture, songs and folklore which are like those of no other country.

NO ONE who was living in France during the years of the war can ever forget the prime importance which the question of Alsace-Lorraine and the return of these provinces to the *patrie* after forty-eight years of foreign domination assumed in the eyes of all prominent Frenchmen. Every visitor to Paris before the end of 1918 must remember the black-draped statue of Strasbourg in the Place de la Concorde, where on the occasion of every national fête pathetic and sometimes frantic demonstrations of patriotism would take place, which that great Frenchman, Paul Déroulède, would often lead.

Gambetta, who was from the south, with all his patriotism, had in 1871 exclaimed, 'Let us say no more about it!' But his fellow countrymen never took that view. The Alsatians themselves never forgot their old allegiance, as is shown by the fact that yearly some 5,000 youths of military age passed over the frontier rather than serve in Germany, while between 1870 and 1890 about 220,000 refractory youths were brought up before the local courts.

Distinguished Frenchmen, like the philosopher Emile Boutroux, and Alsatian patriots, like the Abbé Wetterle and Maurice Barrès, had reiterated to me frequently during the conflict that there could be no termination to it until Alsace was returned to France.

And then when the end came, and it was learned that French and American troops had taken Metz, and had marched into Alsace (Strasbourg was entered on November 22, 1918, but only by French troops under General Gouraud), then the delirium of joy all over France knew no bounds, especially in Paris, where all that famous night the searchlights from the Eiffel Tower played on the statue, no longer shrouded with crape but almost hidden under heaps of flowers, and people stood before it unable to check their tears.

Today Alsace is one of the most beautiful provinces of France, with traditions and customs of its own, and an art, architecture, songs and folklore which are like those of no other part of the country. Do not think that these traditions and local customs are German, for they are not. I do not wish to discuss politics here, but it is well known that the efforts of the Germans from 1871 to 1918 to Germanize the province failed utterly. It was indeed rather the contrary, for as Maurice Barrés said, French culture penetrated more into Germany through Alsace than the reverse, since all Germans going to the annexed province, especially the officers, took back with them to their own country something of French ideas and tastes. Alsace had had a sort of civilization ages ago when the Germanic hordes were still roaming about in their forests.

The history of the two provinces, which has been agitated enough, goes back to very ancient times; and if to

Portion of one of the small Alsatian towns which have preserved much of their old-time charm.

some extent in the course of time they became Germanized, it must be remembered that before the annexation of 1871, Alsace had been united to France for two hundred years and Lorraine since 1766.

In spite of these vicissitudes, Alsace with Brittany and Bearn has preserved its physiognomy and picturesqueness better than most of the French provinces. Strasbourg itself was in an old song ages ago called *die wunderschöne Stadt*, and so it is today—one of the most beautiful cities in the country. The addition of fortifications, completed in 1880, changed it somewhat from what it was when Victor Hugo described its beauties, but the clear green waters of the two pretty and unspoiled rivers, the Ill and the Aar, still run between masses of picturesque edifices, with their gables and steep roofs with many windows; and the portions of the city burned down and rebuilt by the Germans are not very considerable.

A picturesque view from Vosges Mountains overlooking precipices of unusual beauty.

IN A suburb of Strasbourg, and near to its port, is the Bridge of Kehl, on the 'noble Rhine,' which leads to Germany, for the frontier passes through the middle of the bridge and the river. Beyond on the other side stretch the Black Forest and the immense plain of the Rhine, one of the richest regions of Germany and strikingly similar to Alsace and the Vosges both in the configuration of the mountainous country (the two chains starting and ending in the same latitude, and having the same rounded forms, domes and plateaus) and in the vegetation and even the architecture—while the very storks, in their picturesque poses on the roofs, favor both sides of the river impartially—though the truth must be told that the storks these days come much less frequently and since the war have almost abandoned these regions.

Alsace, then, forms a passage or corridor between the River Rhine and the range of the Vosges; and it was for this reason that the old Gallic city, dropping its ugly Latin name, came to be called Strateburg, or Strassburg, the burgh on the roads. Throughout the province, from Saverne to Mulhouse, the stranger sees the same delightful succession of towns and villages built in the famous pink sandstone, which seems to make it smile with an eternal spring, backed by the blue mountains, which are still here and there dotted with medieval castles and covered with the dark green of pines and firs, the lighter tint of the beeches and birches, the bright green of the meadows, and the slaty tone of the vines. Now and then the green is relieved by the sky-reflecting blue of a lake or river.

A fine province for the artist and the lover of the picturesque, and an ideal one, too, as I found, for the mere automobilist, bent on getting the freshest air and much of it. I have mentioned the pink architecture, and the visitor will be struck with the continuity of tradition in the architecture, which in spite of endless diversity—whether Moyennage, Renaissance, or 18th Century—seems always to keep its distinction, character and unity, as if those who through the ages built new houses according to new ideas nevertheless respected the old.

In places like Strasbourg and Colmar there are whole streets lined with houses built two or three centuries apart, each in the style of its time and yet all presenting an identical physiognomy. The first really French architecture did not appear until the early part of the 18th Century, under Louis XIV, and was in the first place mostly military. The Renaissance had had little influence in Alsace as in other parts where Gothic still reigned supreme.

If you ask an Alsatian which are the greatest glories of his country, it is practically certain that he will reply: the Cathedral of Strasbourg and St. Odile—the one a superb work of art, the other the mountain summit dedicated to the Patron Saint of the province. Here, on the top of a rock, accessible only on one side and overlooking on the others three precipices, is a shrine which the natives hold most dear. Barbarians, Celts, Gauls, and Romans have left their stamp here. It is the chief object of pilgrimages in the province (first of all for the believers,

Old houses in the quarter of Strasbourg known as 'La Petite France.'

STRANGE MEN *Who Could Not* Keep Straight

By GEORGE HENRY PARISH

PART II

IN TEXAS there lived a man about eighty years old who was known in the prison at San Quentin, California, as Charlie. During the Civil War he was a member of the famous Quantrelle gang which fought for the South. After the war he went West and became a stage robber.

In the late seventies, Charlie and another man robbed a stage in Nevada County, California. In the strong box they found $15,000 in cash and took it. It so happened that the man who owned the money was a passenger in the stage. He was a banker. When he saw robbers taking his cash he became frantic. He leaped from the stage, threw his arms around Charlie and tried to get the money. Charlie's partner told the banker to lay off, but the banker paid no attention. Charlie's partner shot him dead.

The two desperadoes bought a team and an express wagon and drove by way of Arizona and New Mexico to New Orleans, where they divided what was left of the money and separated. Charlie went to a little town near the Ohio-Indiana border, bought a little lumber yard, worked hard and prospered. People liked him. He was even discussed as a candidate for mayor.

Away off, somewhere else, Charlie's former partner in crime had just been picked up by the police and was lying in jail drunk. He had a cell-mate and to this cell-mate he told the story of how he and a man named Charlie, who now ran a lumber yard in a certain town which he named, had years before robbed a stage in California and killed a man. The prisoner to whom the story was told repeated it to the prison authorities.

The wires to San Francisco tingled a little and in a few days the San Francisco chief of police swooped down upon Charlie in his lumber yard, and took him to Nevada City, where he was placed upon trial for murder. Charlie's partner was brought along too and he was convicted, sentenced to death and hanged.

Charlie escaped death by the vote of one juror—a former Confederate soldier. He was willing to send Charlie up for life, but he balked at hanging him. So Charlie went up for life.

Charlie had no more than got into the prison at San Quentin than he began to lay plans to get out. In a little while he noticed that a trusty drove a cart out of the prison two or three times a day and that whenever it rained the cart was covered with a tarpaulin. A man at the gate was supposed to raise the tarpaulin and look under it, but Charlie noticed that, three times out of four, he let the wagon go by without inspection.

At once the idea developed in Charlie's mind to get under the tarpaulin the first time it rained and ride out to liberty. But to do this he must know the driver. He confided his idea to another prisoner who wanted to break out. The other prisoner said he could fix it—he himself would become the driver. He had a plan to bring this about. He made a beautiful inlaid cribbage board and gave it to the official in charge of the prison. The official was delighted. 'I'll give this to my wife for Christmas,' he said. 'Isn't there something I can do for you?'

Of course there was. The man would like to drive the wagon. And the next day he was driving it.

The first rainy day Charlie crawled under the tarpaulin that covered the wagon and the journey to the outside world began. Once outside the prison walls, they soon abandoned the horse and wagon, plunged into a barley field and covered themselves with straw. Not an hour had passed before they heard the prison guards who were out with guns combing the country.

AFTER hiding days and traveling nights for a week they reached Sacramento, where Charlie bought a revolver and went to a restaurant for the first meal since he left prison. He had no more than sat down before two policemen came in, lighted cigars at the cashier's desk and talked for a minute or two. Charlie put his revolver on his knees, under the table, but the policemen walked out. After the two desperadoes had finished their meal they went out and another policeman followed them. Charlie drew his revolver, hid it under his coat, and faced them.

'Are you following us?' he asked.

'Where are you going?' said the officer.

'We are going home,' replied Charlie.

The answer satisfied the officer and he went his way.

'He never knew,' said Charlie, 'how close he came to Kingdom Come.'

The two desperadoes spent the winter in the vicinity, pretending to be woodchoppers, and in the summer drifted to Chicago, where they separated. Charlie went to work, boarded with two sisters, fell in love with one of them, became engaged to her, saved $800, bought a lot upon which to build a home, and was about to be married when, for the second time, a pal, caught at robbery, told the police where Charlie was.

Charlie, in prison again, sent for the girl to whom he was engaged, told her for the first time who and what he was, told her that he would soon be taken back to California to spend the rest of his life in San Quentin prison, gave her the lot and the $800 that he had saved, together with his gold watch and chain—and bade her goodby!

CHARLIE was taken back to San Quentin and had been there twenty-nine years when Mr. Older first saw him.

The manner of their meeting was dramatic. On one of his frequent visits to the prison where Older used to go to talk with the prisoners, he was shown into the little room where a rope dangles from a beam and a trap-door is in the floor beneath. A prisoner who acted as guide made a little talk, explaining everything. He was an old man—nearly seventy—but still of good appearance, erect and strong. He told how a heavy weight was attached to the rope to take all of the elasticity out of it, and how three prisoners cut three different cords, only one of which was attached to the fatal trap, this to make it so that no one could know which had cut the cord that counted. All this and more the old man told as if a gallows had never meant anything in his life.

Something in the man's manner so interested Older that he asked the warden who he was.

'That's Charlie,' replied the warden. 'He is an old stage robber, in for life for murder. He has been here twenty-nine years.'

'My God, why isn't he paroled?' exclaimed Older.

'I wish you would get him paroled,' replied the warden. 'He is a fine character. I would trust him to take a million dollars around the world and bring it back to me. He would come

back on the appointed day with every cent of it.'

Older had a good deal of trouble in getting Charlie out. Up in Nevada County there was still much feeling against him, but Older eventually got a number of the leading citizens to sign the petition for the bandit's parole and Hiram Johnson, who was then Governor of California, granted it—as a Christmas present to Older.

Before Charlie was actually released, he had what might be called a 'coming-out party.' Various prisoners stole from the stores of the prison the different ingredients of a dinner, including cigars, and one of the prisoners made a large supply of home-brew. With the consent of the prison officials, the dinner was pulled off after midnight when all the prisoners except Charlie and his friends were asleep. When the repast was over and Charlie, comfortably full of home-brew and with a good cigar, settled back in his chair he was ready to talk as he had not talked in twenty-nine years.

After Charlie's release, Older took him to his ranch and set him at farm work. It was on one of the days immediately following that Charlie first told Older of the girl to whom he had been engaged so many years ago.

'I think I have her picture here now,' he said as he reached into his pocket and drew forth the picture of a very nice looking young woman.

'Of course, she isn't young any more,' he mused. 'She must be almost as old as I am. She wrote to me for eighteen years, but I finally advised her to stop writing as she might want to be married some day and if she were writing to a man in prison it would be difficult for her to explain it.'

Charlie worked well at the ranch, saved his money, was generally respected and Governor Johnson eventually gave him a full pardon, thus restoring his citizenship. At the ranch he associated with various kinds of criminals whom Older was trying to reform, all of whom he could stand except petty crooks. One time Charlie saw another employe smoking Older's cigars. Charlie denounced him in the most savage English he could command and then rushed up to the house to see if the man had also stolen Mrs. Older's necklace. Mrs. Older was not at home and Charlie, knowing where she kept her necklace, feared it might have been taken. But it was there.

Charlie finally became too old for farm work and Older got him a light job in San Francisco. One night there came to his room a burglar who was working at Older's ranch. The burglar, who was somewhat drunk, said that he had just robbed a woman of the underworld of six dollars.

'Where are you going tonight?' asked Charlie.

'Back to Older's ranch,' replied the burglar.

'Don't you dare,' exclaimed Charlie, getting out of bed. 'Don't you dare go to Older's ranch with stolen money in your pockets. You come with me.'

Charlie dressed himself, went out with the burglar and made him return the money to the woman from whom he had stolen it.

AFTER Charlie's citizenship was restored he went to Texas to start life anew—at the age of more than seventy! He said he was never going to let any of his new friends know who he was or what he had done. Older said that the last time he heard from Charlie he was well and happy.

As criminals go, Charlie was quite a normal old fellow. He would rob stages, or hold up a citizen, but he was not a 'nut'—he had no little peculiarities that defied explanation. Older's inquiries into criminal character had so often brought him into touch with queer crooks that he was quite delighted when an ex-prisoner on his ranch told him about George.

George was forty years old and a burglar. Older had got him paroled and he was coming to the ranch. A man who had served in prison with him vouched for him to the limit.

'I tell you, Mr. Older,' said the man, 'that guy George is 100 per cent right. I know because we were in San Quentin together in the same cell. We were in an eight-by-ten room for three years and never had a cross word. Few men get along that well with their wives.'

When George came to the ranch, Older was glad to make the acquaintance of 'a guy who was 100 per cent right.' He looked all right. He was gentle, kind, sympathetic and had never used tobacco or alcohol.

Moreover, George was very fond of children and the youngsters at the ranch soon became fond of him. They did not know he was a burglar and warmed up to him just as they would warm up to anyone who paid attention to them and was kind to them. He took the youngsters into a nearby forest and showed them a little waterfall he had made that he called his 'Little Yosemite.' He told them fairy tales, showed how he had trained certain squirrels so that if he knocked on the trees in which they lived they would come out on the branches. George was very nice.

But one evening when Older returned from the city, Mrs. Older met him down the road all excited and her hands trembling. She said George had turned queer. When she had asked him to turn a calf into the pasture where it could learn to eat grass he refused to do it. She told him that Mr. Older wanted the calf turned into the pasture but that made no difference. He said the calf might eat too much grass and die and he would not turn it into the pasture for Older or anyone else. Older said to let George have his way and there the matter dropped.

A few evenings later the former prisoner who said George was '100 per cent right' came around to call and spend the night at the farmhouse. Older decided to say nothing to him about George's queerness.

The next morning the visitor went to Older and told him that George had gone to the bad.

'He is 90 per cent wrong now, Mr. Older,' he said. 'You know the electric pump that pumps water up to your house. I asked him to turn the switch and set it going. You had told me to start it this morning. Do you suppose he would turn the switch? He would not. When I told him you wanted the pump started he said he did not care if you did, that you were using altogether too much water at the house, particularly on the flowers, and that furthermore the pump would be worn out if it were used so much.

'I told him that you would not live at the house if there were no flowers and that if the pump were to wear out you would buy a new one, but it made no difference. He said he would not do what he knew was wrong for you or any other man. "If Mr. Older ordered me to kill one of the horses," he said, "do you suppose I would do it just because he told me to?"

'I replied that I (*Continued on page 20*)

The BALLOON That Never Returned

A Mystery Story of the Arctic

The great balloon fairly leaped into the air.

By BURT M. McCONNELL

Illustrated by
CHARLES L. McCONNELL

IN ALL the annals of Arctic history there is no deeper mystery than that surrounding the disappearance of Salomon Andrée and his two companions, Nils Strindberg and Knut Fraenkel, during an attempt to drift over the North Pole in a free balloon.

On the morning of July 15, four days after the start from Spitsbergen, a carrier pigeon, apparently exhausted, alighted on the rigging of a sailing vessel near Andrée's base, and was shot by one of the crew. It was only by the merest accident that the message wrapped around one of the tail feathers of the bird was found, as the sailor who shot the pigeon thought it was a young ptarmigan. The amazement of the captain may be imagined when he read:

> July 13th, 1897. 82.2° North; 15.5° East. Good progress toward the North. All goes well on board. This message is the third by carrier pigeon. Andrée.

That is the only word, direct or indirect, that the world has received for thirty years concerning the ill-fated Andrée party.

Andrée made his ascent from Spitsbergen, 618 geographical miles from the North Pole, in a 20-mile wind. If his voyage had continued northward at that speed, the three aeronauts would have been at least a hundred miles beyond the Pole at noon of the second day out. But the pigeon message tells another story. Instead of having made an aerial voyage of 850 miles, they were, at noon of July 13, only 145 geographical miles from their point of departure. The question thus arises: Was the 20-mile-an-hour wind in which they ascended part of a cyclonic or whirling storm? Perhaps Andrée's first two pigeon messengers explained the strange movements of the huge gas bag—but these messengers were never recovered.

Nor did any of the other thirty-two carrier pigeons which the explorer took with him ever return, although King Oscar, of Sweden, sent broadcast throughout Siberia and other countries bordering the polar seas offers of a large reward for any information concerning the explorers. For months a sharp lookout was kept by all ships in northern latitudes for the balloon drifting on the ice or in the water, and the natives of Siberia, Alaska, Northern Canada, and Greenland were urged to keep a lookout for the shipwrecked men. But with the exception of the third message by carrier pigeon, no trace has ever been found of Andrée and his two companions.

Several years ago, the writer, in company with Vilhjalmur Stefansson and two members of his expedition, was marooned on the north coast of Alaska. During the winter we heard, from Eskimo and white men alike, two versions, remarkable for their similarity, of the Andrée mystery. One was to the effect that an Indian in touch with one of the northernmost factors of the Hudson's Bay Company, while traveling along the north coast of Canada some eight hundred miles to the eastward, had met a party of Eskimos who had with them a good deal of brass and other metal fittings out of which they made knives, arrowheads, and other weapons; a quantity of light- and medium-weight rope, and some fine waterproof cloth. These Eskimos told the Indian, according to his tale, that several years before while on one of the islands of the Arctic archipelago they had beheld the landing of a 'big bag,' larger than anything they had ever seen. This huge *avwatakpok* (inflated sealskin), said the Eskimo, sailed toward the islands from the frozen sea and finally landed.

Three men, so the story runs, stepped from this strange apparition and made what the Eskimo interpreted as a threatening gesture. Since neither party could converse with the other, one misunderstanding led to another and finally a fight followed, in which the white men were killed.

This story, as I recall, was received with much skepticism by our party. In the first place, an Indian from the Fort Churchill regions would never venture along the border of the Arctic

Ocean on a trading expedition, for the Indians of Northern Canada live in deadly fear of the Eskimos to the northward, and consider them barbarians and cannibals. Strange as it may seem, the Eskimos of Victoria Island, for example, hold the same belief concerning the Indians of the mainland.

It is unlikely, therefore, that any Indian ever communicated with the Copper or other Eskimos living in the vicinity of the North Magnetic Pole, or learned anything through them, indirectly, of Andrée's fate. There is also this to be said of the Eskimo: If you ask him specifically if he saw a balloon drop out of the sky, he will assure you that he did. There is no limit to his imagination, nor does he wish to seem inhospitable in giving you one answer when it is plainly apparent that you want a different reply. In other words, he aims to please. If our super-dirigible, the *Los Angeles*, were to land at an Eskimo village, it would occasion little, if any, surprise; for the natives devoutly believe that their medicine men are capable of making, for example, a trip to the moon between sunset and sunrise.

In the face of this childlike innocence, a statement that we have airplanes that can fly as far in one day as they can travel by dog team in six months would occasion little surprise, in view of their belief in the uncanny ability of their *shaman* or medicine man. Finally, it is very unlikely that three white men, equipped with modern rifles, would be worsted in a fight with Eskimos equipped with very primitive bows and arrows, even though the latter might be tipped with points made of native copper. As for the brass and other metal fittings, these could have been obtained from any of the numerous wrecks of whaling vessels scattered along the coast of Arctic Canada.

Their second tale, which is more probable than the first, is that the three white men who came down out of the sky in a 'big white igloo' starved to death, and that the natives thereupon confiscated the ropes and other equipment. This story came out by way of a mission, but in neither case was there any substantiation in the form of relics, pieces of rope, sections of the balloon, or other equipment by which the expedition could be identified.

There is this to be said in favor of the two stories, however: If Andrée and his two companions landed on solid land and starved to death or were killed, it would thus be possible to explain why no wreckage of the balloon has ever been picked up at sea or on any Arctic coast line. It is also possible that Andrée, after sending his third message, met with an unfavorable wind which carried him over to Greenland, and that while drifting over this desolate, ice-covered area, he was forced to land by an accumulation of snow on the balloon, and by an accumulation of ice on its ropes. There is also the possibility that the three aeronauts might have been so severely injured in the landing that escape from the Greenland ice cap was impossible. Whether they landed in the sea and were drowned, or descended on the ice fields between Spitsbergen and the Pole and perished there, or on one of the islands in the Far North, are questions that have been discussed, but never answered.

Andrée's final landing, if it was a voluntary one, would have depended upon the state of the wind. When a light wind is blowing, an aeronaut may descend to earth without much trouble, but a descent in a stiff wind is another matter. His safety may then depend on whether he can cut the basket loose before the balloon bounds upward, or before he is spilled out on the ground or the ice.

Unfortunately, instead of stowing his food, boat, and other equipment in the basket, and then arranging to cut the car loose in an emergency, Andrée carried all his provisions and equipment above the suspension ring. What may easily have happened, therefore, was the escape of the balloon, carrying with it the precious supplies and outfits, after the occupants had themselves been spilled out upon the land, in the water, or on an ice field. If the latter, they probably were unable to reach land by trudging over the rough surface of the Arctic pack. If they landed on the sea, the probabilities are that they were drowned almost immediately. But it is believed that they landed on the solid earth, since no trace of them has ever been found.

While Andrée's voyage into the unknown by balloon required a better grade of courage than the voyages of his Viking ancestors into uncharted seas, it was not a foolhardy adventure, as some have claimed. Nor was the commander of the expedition a mere adventurer. When he set out on his journey through the clouds in 1897, Andrée was 43 years of age. Two years before he had laid his ideas for a balloon expedition over the North Pole before the Swedish Academy

The message around one of the tail feathers was found.

of Science, and they had been approved. Meanwhile, he had made a number of balloon ascensions, and had had some thrilling adventures, having been carried on one occasion over the Baltic Sea to Finland. On another he made an involuntary aerial voyage from Gothenburg to an island nearly three hundred miles across the Baltic.

Andrée was fair-haired, keen-eyed, tall, muscular, and alert, with something in his manner that immediately singled him out as a man of daring and determination. His two companions were balloonists and civil engineers. The Andrée scheme for reaching the Pole by balloon was evolved after methods which had been employed for centuries had failed.

Andrée's balloon, the *Eagle*, was built by a well-known balloon maker of Paris, at an original cost of $10,000. The balloon was 97 feet from top to bottom, and 67 feet in diameter at its largest point. The original balloon, made in 1896, was made larger the following year by adding a strip 3¼ feet high in the middle. His thirty-two pigeons were secured in Holland, and trained at North Cape, Norway. The best were sent on board whaling vessels out into the polar sea, and released. Several flew southward; one was caught, three days after its escape, 1,000 miles south of the starting point; but the majority of them seemed to feel at home in Norway, and it was from this number that Andrée's pigeons were selected. When the balloon ascended on July 11, 1897, it carried food sufficient to last the party nine months, and ballast, equipment, and clothing which brought the total weight to five tons.

Andrée was not a dreamer by nature, but a practical balloonist, a member of the Swedish Academy of Science, a professor of pure and applied physical science, and perhaps the foremost European student of aerial navigation of his generation. It was his theory that at certain seasons of the year there were steady winds that blew from Spitsbergen to the Pole and beyond, and that high above these surface currents a steady northward gale would be found. This belief led him to his doom, just as Commander De Long's theory of a northward current had lured him to his death fifteen years before.

From his observations while a member of the Swedish Government's meteorological expedition to Spitsbergen, and from tests made by other scientists, Andrée concluded that these northern trade winds would carry the balloon to the unknown area between Spitsbergen and the Pole within a few days, then directly over the northern axis to Hudson's Bay or the mouth of the Mackenzie River. Or, if the wind should shift, he would be sure to reach Alaska or Siberia.

Receiving the support of other eminent scientists, Andrée appealed to the Swedish Government in 1895 to finance a balloon expedition having for its main object the exploration of unknown regions between Spitsbergen and the Pole and between the Pole and Alaska. A subscription list, headed by the King of Sweden, was soon completed, and the Swedish Government entered whole-heartedly into the plan. The expedition was elaborately outfitted in every detail. The balloon was the largest ever constructed. It was, in fact, four times as large as the average balloon of that day. Two, three, and in some places four thicknesses of Chinese silk, varnished inside and outside, were used to make the gas bag, and over this was an extra covering of silk, varnished and waterproofed.

The basket, 7 feet wide and 6 feet high, was made of waterproofed sailcloth, and was so arranged that one man could rest while the others remained above to make observations. A mattress and sleeping bags of reindeer skin covered the floor, and on the walls of the canvas basket were places for books, toilet articles, navigating instruments, charts, kitchen utensils, rifles and ammunition. There were two small windows.

The top of the basket served as the floor of the observatory, around which ran a large wooden ring. From this ring were suspended by ropes the picks, shovels, and other tools; a sledge, snowshoes, dog harness, and a light canoe covered with varnished silk. These ropes also held the food, consisting of condensed milk, pemmican, chocolate, bread and butter; and fresh water, champagne, and claret—enough to last Andrée and his companions for four months. It was Andrée's belief that if he was compelled to land on the ice and make his way back to civilization, he would be able to live for almost two years on the polar bears and seals in that section of the Arctic.

At the time Andrée's plans were being made, the wireless had not been invented. The only known method of sending back information was by carrier pigeon. The explorer took with him thirty-two of these birds, and in addition a dozen virtually indestructible buoys which he planned to drop into the water or on the ice as he drifted northward. An additional buoy, larger than the others, was to be left at his 'farthest north.' Each was equipped with a copper tube in which a record or dispatch could be placed. It was calculated that the balloon could remain in the air for at least a month, and that by throwing away superfluous equipment, Andrée could extend this to six weeks.

Andrée and his assistants loaded their balloon on board a steamship and, accompanied by several Swedish scientists and government officials, left Sweden on June 7, 1896. Arriving at one of the islands in the Spitsbergen group, which was to be the base of operations, they availed themselves of a cottage that had been erected several years before, put the pigeons in the attic, and established a camp. A portable balloon shed had already been built in Sweden, taken down, and stowed aboard the vessel. This was now brought ashore and assembled, the hydrogen gas tanks next were set up and by the middle of July the inflation of the big balloon began. Day by day for two weeks, the great bag began t

Three men stepped from this strange apparition and made a threatening gesture.

Do you dream of *Independence* for them?

THEN LIVE THIS NEW LIFE

HOW much more rich will life be if you realize that each day is leading you towards a certain financial independence amid ideal working and living conditions? How much better for them!

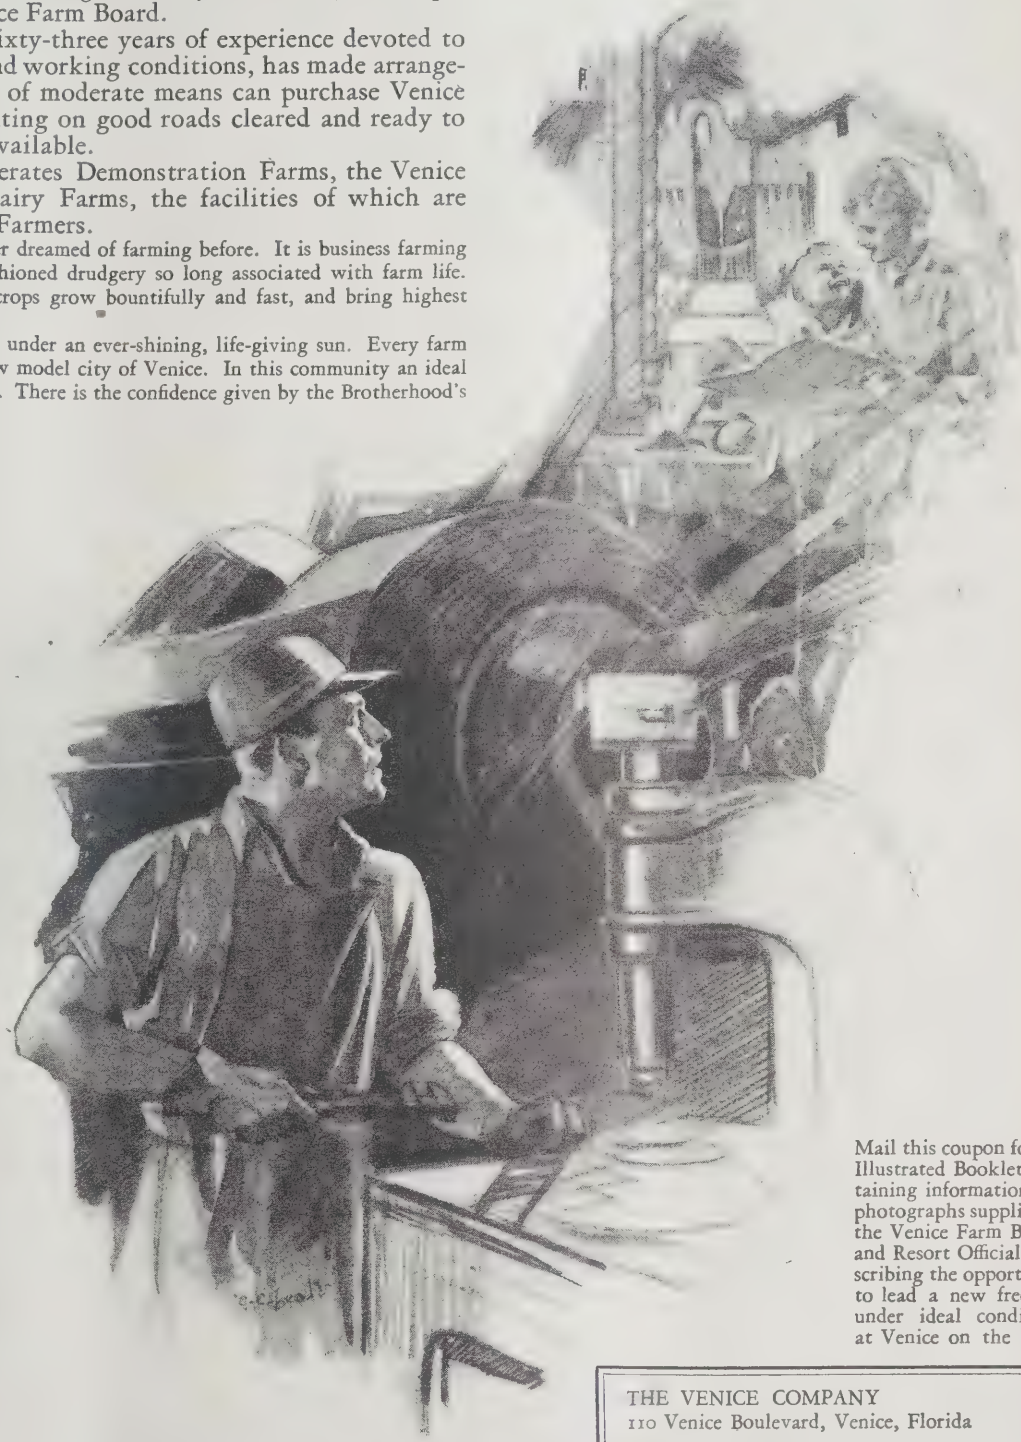
Talk over with your wife the new plan which the financially powerful Brotherhood of Locomotive Engineers has worked out at Venice, Florida, to supply a basis of future independence for people who will operate business farms on soil of high fertility, backed by the experience and advice of the Venice Farm Board.

The Brotherhood, with sixty-three years of experience devoted to the improvement of living and working conditions, has made arrangements so that earnest people of moderate means can purchase Venice Farms on liberal terms—fronting on good roads cleared and ready to plant, with main drainage available.

Here the Farm Board operates Demonstration Farms, the Venice Nursery, and the Venice Dairy Farms, the facilities of which are available to Venice Business Farmers.

People are coming here who never dreamed of farming before. It is business farming—entirely different from the old-fashioned drudgery so long associated with farm life. Here nature lends a helping hand, crops grow bountifully and fast, and bring highest prices in early winter markets.

Here is year around out-door life under an ever-shining, life-giving sun. Every farm is in easy driving distance of the new model city of Venice. In this community an ideal life and real independence is possible. There is the confidence given by the Brotherhood's financial strength, practical help by men who know Florida farming, the companionship of people who have already embraced the opportunity and are on the ground, and finally nature's own best co-operation.



Venice a natural all-year resort

Venice life is divided between agriculture, industry and resort activities. Vacationists remark the variety of diversions. Here one finds the West Coast's only mainland beach and its most famous fishing grounds. Here is a modern city planned and built by experts which fronts on the beach. Adjacent to it is what visitors call the largest and most comprehensive farm development ever projected in America . . . Venice hotels serve fruit, vegetables, milk and cream received fresh every day from Venice Farms nearby. Conveniently located are well kept golf courses, tennis courts, quoits and other games, and excellent hunting and fishing are found in the tropical Myakka River and its valley. Hotel rates from $5.00 to $15.00, with 60% of rooms at $5.00.

Venice Florida,

swell, until by the beginning of August it was ready for the flight over the Pole.

But the south trade winds, upon which the success of the expedition depended, failed to materialize. After a nerve-racking wait of three weeks, Andrée decided that a voyage through the air over the Arctic Ocean, with a heavy fall of snow imminent, would be too dangerous, so the valves of the gas bag were opened and the 176,500 cubic feet of gas were allowed to escape. Although the month of August had not passed, winter was close upon the explorers, and they were compelled to return to Sweden.

The next year Andrée and his companions sailed for Spitsbergen a month earlier. The balloon shed, which had been left standing, was repaired; the balloon was unloaded, and by the middle of June the work of inflation had begun, all the stores had been landed from their vessel, and it had started back for the mainland.

It was not, however, until July 11 that a suitable wind came out of the southward. Even then, there was some doubt as to whether the breeze would continue. After a consultation among Andrée and his scientific advisers, Andrée announced that he would start, accompanied by his two companions of the year before, Strindberg and Fraenkel. The crew of a Norwegian gunboat and the men from three Norwegian sealers, at that time anchored in the bay, hurried ashore to lend their aid. Soon the entire northern side of the balloon shed had been ripped out.

WHEN the process of inflation had reached an advanced stage, the car with its instruments, tools, and provisions, weighing in all about 1,400 pounds, was attached to the balloon. The explorers exchanged parting handshakes with their friends, Andrée made a final inspection of the balloon and its equipment, and then, smiling confidently, he ordered three sailors to cut the ropes which bound the huge bag to earth.

The great balloon, thus liberated, fairly leaped into the air and Andrée and his two companions were off in the direction of the North Pole. For half a minute the balloon rose steadily, then it was caught in a 'down draught' roaring like a waterfall over the mountain tops, and carried downward toward the sea. In fact, the car actually touched the water. But only for a second; hundreds of pounds of ballast were thrown overboard, then a steadier breeze carried the balloon upward out of the danger zone. In the strong, heavy wind the great bag swiftly ascended several hundred feet, and was soon traveling at the rate of twenty miles an hour into the North. Finally it disappeared beyond a range of hills and the watchers, faithful to the last, returned to the mainland.

Less than forty-eight hours after the balloon was set adrift over Spitsbergen, Andrée dispatched his now famous third message by carrier-pigeon. This message caused great excitement throughout the entire world. It indicated that Andrée and his two companions had traveled approximately 150 geographical miles in the course they wished to follow—about one-quarter of the distance to the North Pole. Apparently the gale had died down, but even at this rate, scientists in Stockholm figured, Andrée would reach the North Pole within a week; it was even agreed that he might reach the north coast of Alaska within fifteen days.

But when Andrée and his two companions disappeared into the North, they vanished from the sight of civilized man.

To this day—thirty years after—no one knows whether they met disaster by storm, whether the balloon caught fire, whether they landed on the Greenland ice cap,' or on one of the islands between the North Magnetic Pole and the Geographical Pole. What seems certain is that they did not meet disaster on the drifting ice floes of the Arctic Ocean or in the open water, for in that case some of the equipment of the expedition—buoys, parts of the basket, pigeon-crates, sleds, and other articles, not to mention the balloon itself—some of these would have drifted ashore somewhere if the balloon had met disaster on the ice fields or in the water. Wreckage from the *Jeannette* and certain kinds of driftwood indigenous to the north coast of Siberia floated across the Pole to Greenland and the north coast of Norway; heavy wooden casks set adrift in Bering Strait have also drifted into the North Atlantic; and there is every reason to believe that the buoys carried by Andrée would not have been crushed in any Arctic storm.

It is also believed among explorers that if the balloon had fallen on the ice, this eventually would have drifted down into the North Atlantic, where it would have melted, and thus released the wreckage. In this fashion, then, some relic of this ill-fated balloon expedition would have been found. So far, nothing has been reported. And, as few men have ventured to cross the Greenland ice cap, or the Parry group of islands north of Canada, the probability is that Andrée and his companions will remain fast in their icy prison forever, an addition to the long list of adventurers sacrificed on the frozen altar that has claimed its victims from almost every nation since the 14th Century.

Strange Men

(*Continued from page 15*)

would kill a horse or burn the house if you told me to, but George would not change. He would not start the pump. I tell you, Mr. Older, George is off his head.'

George soon wearied of the ranch and Older got him a job in San Francisco. After working there a while he decided to go East. Before leaving he went down to the ranch to say goodby and took with him his dog, which he gave to Older, who still has it. He seemed sad at the thought of leaving. He went out into the woods and rapped for the squirrels, but boys had shot them all. His 'Little Yosemite' had been washed out by an autumn rain.

George has been in the East a number of years, but every Christmas he sends cards and other gifts to the Olders and a box of chocolates for his dog.

Tim O'Grady walked into Older's office in San Francisco one day with a linnet on his shoulder. He said he had just got out of San Quentin and, not liking to leave the bird that had been his cell-mate, brought it along with him. He thought Mrs. Older might like to have it.

Tim told what a comfort the linnet had been to him while he was in prison. When he left his cell in the morning the bird used to fly away and spend the day with other linnets outside, but at the ringing of the prison bell at night the bird would fly back to his cell and be locked up with him.

Tim was a thief, but as Older says, 'not a bad fellow; kindly, full of fun and mischievous.' As he talked the linnet flew from his shoulder and lighted on Older's desk. Tim then went out to get a job as a waiter and Older bought a cage for the linnet and put the bird in it.

When Older returned home that night he told Mrs. Older about the linnet and she was very anxious that he should bring it home. Older was therefore quite ruffled the next morning when he appeared at his office to discover only the empty cage. The linnet had been taken out and was gone. Older thought somebody in the building was responsible, but in a few minutes Tim came in smiling and said that he had taken the bird the night before because he was so lonesome in his room all alone that he could not stand it and wanted the bird as company. But he had brought the linnet back and promised never to take it again.

OLDER took the bird home that night and Mrs. Older soon became much attached to it. She called the linnet 'Little Tim.' Tim himself disappeared, but a few weeks later Older read in a morning newspaper that he had been arrested for attempted theft. Although Mrs. Older had never seen O'Grady her sympathy had gone out to him on account of the bird and when she heard of his arrest she looked sorrowfully over to the linnet and said, 'Little Tim, your father is in jail.' Turning to Older she said: 'You must get him out.'

Older went to the chief of police and told him the story of Tim and the bird. The chief sent for Tim and he was brought into the room in handcuffs. The chief ordered the handcuffs removed and then began a heart-to-heart talk. The story of the bird had touched him and he meant to set Tim free. He told Tim he was among friends that they would get him work and that he must stop stealing. Tim swore he would never steal another thing as long as he lived. The chief set him free and that afternoon he started for a job that had been found for him in the mountains.

'Tim is out,' shouted Older to his wife when he entered the house that evening.

'So is Little Tim,' she replied. 'He flew out the window an hour ago. I am sorry to lose him but glad he is free.'

Mr. Older, a few weeks later, received a postal card from Tim, bearing the postmark of a little town in Iowa. After sending regards to everybody, Tim closed with the remark that 'I shall be here for about four weeks.'

'That sounds like thirty days to me,' said an ex-prisoner to whom Older showed the card. 'Tim has been stealing again.'

All of which Older later learned to be true. Tim couldn't keep straight.

Mr. Older has studied criminals for more than forty years. In the beginning he believed that criminals were ordinary persons that the vicissitudes of life had happened to turn into forbidden by-paths. Observation has compelled him to abandon this belief. He is now of the opinion that they are a class apart; that they were born with a kink in their brains that makes them see things as the rest of us do not.

Alfred Brunson, Wisconsin's *First* Methodist *Circuit Rider*

By FRED L. HOLMES

CIVILIZATION may destroy historic landmarks, but it cannot obliterate the records made by brave men. Reverend Alfred Brunson, the pioneer Methodist circuit rider of Wisconsin, brought a building over 3,000 miles into the wilderness at Prairie du Chien. This was a novel exploit. For more than fifty years it has been pointed out to travelers and those concerned in the development of the Methodist Church in the Upper Mississippi Valley as a place worthy of notice.

Now the landmark has lost its individuality. Recently the old frame residence was remodeled and sacrificed on the altar of the 'one room and kitchenette' idea of the modern age.

Like old Prairie du Chien, redolent with its story of Indian camp and trading post, this pioneer home had an interesting history and a more glorious background. Around it pivoted a life of service.

Alfred Brunson was a Connecticut Yankee, born February 9, 1793. His father operated a ferry across the Hudson at Sing Sing. He planned to educate his son in the army at West Point. Then came a sad accident. During a violent gale, the father, returning from across the river, lost his life. Young Brunson attempted to rescue him, but the wet hair of the drowning man slipped through the boy's fingers and he saw his father sink for the last time.

A relative apprenticed the lad in a shoemaker's shop. But the incident of his father's sudden death had caused him to think, and pondering the ways of the world Alfred decided he would become a Methodist missionary.

Marrying at the age of nineteen, he went out to the then frontier of Ohio. The War of 1812 had just begun. The country was thrilled with patriotism. The great interior of the United States must be saved for the future generations of Americans who were finding their ways in streams of immigrants over the Alleghenies. Reverend Alfred Brunson enlisted in the war against Great Britain. So well did he serve that when his term expired, General Lewis Cass urged him to reënlist promising him the first lieutenant's vacancy, if he would do so.

Believing that he must 'be about his Father's business,' however, he declined the offer and returned to Ohio to continue his missionary work. Within this territory he remained for many years, his last station being at Meadville, Pennsylvania, where he was for several years a member of the board of trustees of Allegheny College.

In 1835 a call came for missionaries to go to the frontier of the Northwest Territory, to minister to both the whites and the Indians. Mr. Brunson was instrumental in bringing this need before the Pittsburgh Conference, and the presiding bishop urged him to accept the responsibility. He did not falter.

Before moving his family West, however, he went out to make a tour of his district. At the Illinois Conference, which he attended later in the season, it was decided that his circuit should cover the territory from Rock Island, Illinois, to St. Anthony's Falls, Minnesota, a district 500 miles in length and seventy-five miles in width.

To enter the country north of the Wisconsin River, Mr. Brunson rode to Fort Crawford at Prairie du (*Continued on page 22*)

The Reverend Alfred Brunson on his rounds.

WRITERS!

The Palmer Institute of Authorship endorsed by

Jesse Lynch Williams

"THE Palmer Course is the best thing of the sort that has been brought to my attention," says Jesse Lynch Williams, former president of the Authors' League of America. "It is better than any system of teaching the writing of fiction in any of our colleges or universities I have personally investigated, although it may be they have been improved since my day."

Jesse Lynch Williams' famous Princeton stories are still bringing in royalties after 31 years. Other books, including Pulitzer-prize play 1917, attest his success. The principles he has applied to make his writings famous, the Palmer Institute can teach you. It can help you write stories that sell!

Chien, arriving there late in the autumn of the same year. The trip was often referred to by him as one of the most difficult, but one of the most interesting in his whole life. The country was sparsely settled and it was possible to follow the military trail that connected Portage with Prairie du Chien.

From his diary of this trip, which was published some time ago by the Wisconsin Historical Society at Madison, Wisconsin, the following is taken:

Just about sundown I reached the house of Brother Samuel Gilbert, Prairie du Chien. This good brother and his wife were Methodists in Kentucky, but there being no church of their own in the place, they had joined the Cumberland Presbyterians, under the ministry of the Rev. David Lawry.

I was the first Methodist preacher who ever tried this soil, but even here I found friends, yes, warm friends. I soon extended my acquaintance to the small circle of the American population, a few of whom were really pious. And I must say, I never enjoyed myself better among Methodists in my life. Indeed, on the frontier, we seem to be out of reach of the sectarian bickerings of the city and older settled countries.

Leaving Prairie du Chien in the month of December, 1835, on horseback, Mr. Brunson returned to Meadville, arriving in February, 1836. He had been gone from home six months and had traveled, mostly in the saddle, about 3,000 miles, part of the time in the winter season, without losing a day on account of illness.

'Mr. Brunson had in the meantime communicated with his wife, a most businesslike and competent helpmate,' wrote his daughter, Ella C. Brunson, in after years, 'and she had contracted for a keel boat, and a dwelling house built in sections ready to be put together, every door and window ready for its place—the whole to be loaded at a given date for the journey to the new country. The house, eighteen by thirty-four feet, two stories high, with an ell twenty by twenty-seven feet, was ready on the missionary's arrival at home, but business affairs delayed the departure of himself and family until the middle of June. So great was the interest of his neighbors at the return of one from the unknown West that Mr. Brunson was called upon to lecture, to write, and to talk incessantly of what he had seen and learned.'

It cost more than $1,000 to ship his house and belongings by flatboat and canal to St. Louis and up the Mississippi to Prairie du Chien. Here the house was erected in modern Aladdin style, wooden pegs being used to fasten together sections of the building. Until destroyed some years ago, this was the only house in Wisconsin with such a unique history of construction.

At the time of Mr. Brunson's coming to Prairie du Chien, the place was more of a military post and emporium for furs than it was a thriving settlement.

His health failed, so Mr. Brunson studied law, and in 1840 was elected a member of the territorial legislature. On his visit to the infant capital of Wisconsin at Madison for the first time, he was impressed with the beauty of the location, but horrified with the viciousness of some of the people.

'The vice and wickedness of the whole territory seemed to be concentrated there,' he wrote, and the number of 'sharpers' who were attempting to commercialize official responsibilities made him caustic in his remarks. He pointed out that the legislature had enough clerks and officers to run Congress.

Even this spectacle of commercialism in politics did not dim his enthusiasm for Wisconsin. In 1842 he was appointed to the Indian agency at La Pointe and the following summer he opened the overland trail from Prairie du Chien, almost due north, 300 miles to that place.

'In these days of pioneer life, Mr. Brunson's natural ingenuity gave him an advantage over many of the newcomers,' explained his daughter, now a resident of California. 'He was always ready to suggest a way out of a dilemma, and some of them were certainly novel ways. The winter of 1855-56 was an unusually early one; the snow fell to a great depth before the ground was frozen. The first fall of snow found him seventy miles from home in a buggy. His Yankee ingenuity came to his rescue, and, securing the assistance of a workman, he set about the business of getting home. They built a rough sled of boards and, removing the wheels from the buggy, lashed it firmly to the sled, the pole still serving the purpose, with the wheels fastened under and behind the buggy box. With this device the horses had easy work and reached Prairie du Chien in two days. Dr. Elliott, then editor of the *Christian Advocate*, found endless amusement in this incident and commenting on it said: "None but a genuine backwoodsman would have thought of such a contrivance."

'In 1850, Mr. Brunson once more entered the Methodist ministry, and became a member of the West Wisconsin Conference. Two years later he was appointed presiding elder of the Prairie du Chien district. Though sometimes away for months at a time in the performance of his duty, first among the Indians later as presiding elder, Mr. Brunson had no other home after coming West than Prairie du Chien.

'When the Civil War began, Mr. Brunson, although far beyond the age when men are expected to undertake active military duties, volunteered and his services were accepted as a chaplain. He was assigned to the 31st Regiment of Wisconsin volunteers. In the summer of 186[illegible] ill health made a furlough necessary, and this because weakness was terminated by resignation.

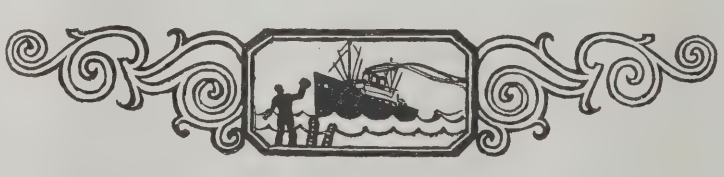
'To him belongs the rare honor of having served his country both in the War 1812 and in that of 1861-65. After the war he continued his work as a Methodist itinerant until 1873, when he had attained the age of eighty.'

When he died, on August 3, 1882, he was buried in the Lower Town cemetery at Prairie du Chien, where sleep so many of his converts. The Daughters of the American Revolution and the Grand Army of the Republic have marked his grave. And the mighty Mississippi rolls onward but a few rods away.

Sonnet

Blanche T. Hartman

AS ONE who chafed at petty little cares
I slipped the leash that held myself in check
And placed my all on one tremendous stake.
The merchant, chancing all his costly wares
To winds and rock and Neptune's hidden snares,
Rejoices as the far off dancing speck
Resolves itself into a mighty deck
Whose timber staunch proudly her cargo bears.
Give me the whole wide world for one swift race.
He misses much whose little shallow round
Keeps him from lowly paths or heights sublime.
I fain would risk the farthest ends of space
And taste its joys, its depths of sorrow sound.
I pity him who cannot fall or climb.



Removing the Smoke Screen From America's Warships

(*Continued from page 2*)

Admiral Jones: 'No, sir, we never had ıch a concrete question before us.'

Through the close cross-questioning of ecretary of the Navy Wilbur during the ıvestigation, the head of the Navy Deartment frankly admitted that under he present administration of the depart-ıent, General Herbert M. Lord, Director f the Bureau of the Budget, really fixed ıe strength of the Navy and shaped the ountry's naval policy.

Chairman Butler submitted to the Secre-ary and other witnesses that followed him table containing the total tonnage of essels laid down or appropriated for since 'ebruary 6, 1922, the date of the Washing-ɔn Arms Conference. The Secretary declared ıat the data in the table corresponded with ıe information in the department which 'as kept in other forms.

THIS was done to bring out the fact that ıe United States since the Arms Conference ad not been keeping pace with the so-called overty-stricken nations of Europe. The ew construction was classified under two eads—ships laid down and those appro-riated for. The committee was not able ɔ obtain the number of ships appropriated ɔr by Italy but that country had laid down 6 ships with a tonnage of 102,207 as com-ared with 13 ships and 90,000 tons for ıe United States. France, which is so overty-stricken that it cannot pay its ebt to the United States, has laid down 71 ıips with a tonnage of 158,048, which is lmost twice that of the United States. ; has appropriated for 24 ships with a ɔnnage of 63,780, as compared with 3 ıips of 30,000 tons for the United States. he total tonnage for France in her present overty-stricken condition is 221,828, as ɔmpared with 120,909 for the United tates. The total tonnage for Japan reached 39,201, while that of the British Empire as 285,795.

In the light cruisers of the first line nited States is led by all the powers with ıe exception of Italy. The tonnage laid own and appropriated for in light cruisers y the United States, the table shows, was 0,000; the British Empire, 138,000; Japan, 8,285; and France, 63,618.

The Secretary was not embarrassed with ıe direct question as to whether this table ıdicated that the time had arrived when ıe United States should further delay the ɔnstruction of its meager cruiser program s recommended by the President. The in-ɜrence was so strong throughout the ques-ons, however, that the Secretary was ıagrined by the comparison.

It was when the committee made a drive ɔ fix the responsibility for the delay in the ɔnstruction of the cruiser program that ecretary Wilbur proved himself to be a ery adroit fencer on the witness stand. His gal training became manifest as the ques-ons came from almost every member of ıe committee, which, if answered directly, ould disprove the claim of the President ıat the Navy is being maintained at reaty strength.

Chairman Butler began by asking whether any of the eight cruisers authorized by Congress had been completed. The Secretary declared that they had not. He hesitated to fix any date for the completion of the cruisers based on the present progress of construction, but finally declared that perhaps the *Pensacola* and *Salt Lake City* would be completed in 1929. He added: 'All depends upon the appropriations made by Congress.'

'Were any of the estimates sent here ostensibly by the Navy Department reduced by Congress?' demanded Chairman Butler.

'I do not think that there were any reductions on the floor of Congress,' was the Secretary's answer.

'Congress has not at any time reduced the amount sent by the Navy Department,' declared Chairman Butler with considerable warmth.

'I think that is true,' admitted the Secretary.

Mr. Vinson, taking up the questioning of the Secretary, asked: 'Of course, as these cruisers were asked for by the Navy Department when the law was passed, you are still anxious to secure them?'

Secretary Wilbur: 'I do not desire to come in conflict with the law in regard to overturning the budget.'

Mr. Vinson: 'Do you feel that the Budget Officer is carrying out the law passed by Congress and signed by the President authorizing the commencing of the construction of these cruisers before 1927?'

Secretary Wilbur: 'I hardly know how to answer your question.'

Mr. Vinson: 'Does national defense in your judgment require the commencing of the building of these ships before July 1, 1927?'

Secretary Wilbur: 'I hardly know how to answer your question, as national defense is rather a large and complicated problem.'

Mr. Vinson: 'Would it be an orderly and economical plan of developing national defense by carrying out the act for the construction of these cruisers?'

Secretary Wilbur: 'I would rather not answer that question.'

THERE was a pause in the cross-questioning of the witness by the attorneys for the prosecution who are carried in the *Congressional Directory* as members of the Naval Affairs Committee.

The silence was broken by Secretary Wilbur who said: 'I want to make myself clear about this matter. I do not want to appear antagonistic to the committee. We submit our recommendations to the Director of the Budget, and if he approves them they go to the President, and he sends them to Congress. An expression of opinion by me might be considered a recommendation which is not approved by the Director of the Budget.'

Chairman Butler closed this line of questioning by declaring: 'The Constitution of the United States does not place any responsibility upon the Director of the Budget for providing for the defense of the nation.'

News Out of Washington

(*Continued from page 8*)

divisions; it is distant from the centers of industry, agriculture, art and finance. It is psychically even more remote, for it is an artificial community, artificially maintained and operated. Washington knows only at secondhand the struggles, the heartbeats, of the nation.

Yet it is the least mysterious of all cities. Its very artificiality is a counter to that element of mystery which surrounds naturally developed capitals like Paris and London.

It is commonly agreed among newspaper writers of wide experience that Washington is the most open and the freest city in the informational sense in all the world. It is so much so that a correspondent once engaged to 'cover' the town by giving just one hour a day to his work, and succeeded fairly well.

IN NO other place of news importance is it easier for newspaper writers to know what is going on, and above all what is about to go on. There is scarcely an official who won't tell a responsible correspondent anything that he knows, thinks or expects. Cabinet members and Congressional leaders often have outlined policies and programs to a writer without even asking for the writer's name. Of course everyone, correspondents or others, doesn't know all that is going on there at any time; for the volume of transactions is immense and the background of many of them confused. These conditions present a problem of true significance. The point is that, within a reasonable range, what goes on there can be known as perhaps nowhere else in the world. Aside from certain documentary matter of a more or less routine nature and usually about as interesting as a problem in geometry, there are fewer secrets in Washington than in the average small town.

Thus most 'inside stuff' out of Washington is mere writing or mere bluff. This last is true of a large part of the big volume of written matter that is sold privately in the form of advance tips or inside information. Some of this is valuable because of shrewd deduction and analysis, but rarely because of an 'inside drag.'

Disclosures anent the 'real' Washington, in periodicals or books, are mostly mere writing, frequently clever, but usually distorted. An occasional fact book as to inner affairs or the personalities of leaders there is worth while. Such as Clinton W. Gilbert's *Mirrors of Washington*, published several years ago. It contains shrewd character analysis and is well written. Most fiction with a Washington setting is mere rubbish. If there is a novel dealing with life at the capital that is worth putting aside for a second reading, it has escaped this writer. All of them, like the most sensational of all, published recently, treat the capital as mysterious and secretive.

There is no 'real' Washington beyond what everybody who wishes to may see and know. There is, however, a contrary belief, apparently supported by occasional disclosures via official investigations. Of these the writer cannot recall one that wasn't known in practically all material particulars before official inquiry brought the facts to general public notice.

THE 'real' facts of the Fall-Doheny-Sinclair affair were available to anyone, and in fact were published widely, long before the general public realized that there was such an affair. This realization was brought about by disclosures of dramatic personal episodes, like that of the 'little black satchel,' which bore on the moral rather than the material equations entering into the disposal of the naval oil lands.

Forbes' inefficiencies in the management of the Veterans' Bureau were heralded to the world long before the disclosure of personal episodes led to his removal and prosecution.

The faults of the Daugherty régime in the Department of Justice were of rather common knowledge in Washington long before Senator Wheeler dramatized them.

Yet the public is not kept well informed as to all that goes on in Washington. But this is not because of any paucity of information sent out by newspapermen. A reaction that has come regularly to writers in recent years is that there is 'too much Washington stuff.' It should not owe to the quality of it, for the newspaper correspondents corps there represents probably a higher average of journalistic skill and character than is found elsewhere. There are too many of them—about 300 sit in the Congressional press galleries alone—with too widespread employment for subversive influences to be controlling.

ARIZONA. *Drawing by* GERALD VAN DER HEYDEN

Then what accounts for the shortcoming? Largely, conditions contrary to those which the public believes exist. Information is too free; above all, too voluminous.

Washington correspondents are treated as virtual parts of the scene which they report. Their privileges are so extensive and established that the correspondents have become in some senses adjuncts of the Government. Press-gallery rights, for example, are as sacrosanct as those pertaining to the floors of Congress. White House Conferences with the correspondents rank almost with Cabinet meetings. Correspondents regularly are advised with, confided in, and appealed to as if they were recognized in the Constitution. These things impose responsibilities just as they ease the way to information. Hence more restraint is exercised by reporters in Washington than elsewhere.

The great problem of volume, that came about during the war, has continued the biggest one having to do with Washington news. This problem has several phases. One is that of selection, for no newspaper can print more than a part of the total. The average subscriber hasn't time, even if he has the inclination, to read all that is published from Washington. Perhaps the most invidious phase has to do with the effect of volume on reportorial methods.

RECENTLY, for instance, practically all the newspapers carried a news story out of Washington regarding a matter of no great importance but of much interest to readers. This writer was asked to elaborate it for the Sunday edition of a big metropolitan newspaper. On investigation, for that purpose, he found that the facts which gave the story interest were at least ninety per cent fallacious, not with respect to literal detail but as to background. *All the correspondents and press associations had written the story from a mimeographed bit of copy which a propaganda organization sent to them.* Not one, insofar as the writer could find, had asked a question concerning it.

A large proportion of the news that goes out of Washington is cleared in that way. Daily 'hand-outs,' that is, prepared manuscript, put out by some of the departments, might fill a newspaper page. Some of the departments have carried the system to the point whereby a positive control over information is exercised rigidly at the source. That is, they insist that the correspondents accept hand-outs or make inquiries through 'publicity men,' usually trained journalists.

Ostensibly the publicity man's job is to help them; really his job, frequently, is to see that news information goes out in ways that can do the department no injury. A lot of systematized propaganda is put over as news in that way. The process is an encouragement to reportorial laziness and editorial economy at the expense of thoroughness and essential accuracy.

But the volume of news information in Washington is now so big that no single news-gathering organization could possibly make first-hand inquiry as to every item thrust upon it. This volume is so big that 'digging' for news, or its meaning, may be passing as an attribute of reporting there.

The Conquest of Middle Age

(*Continued from page 6*)

and greater circulation as follows: 'The army mental tests have shown that there are, roughly, forty-five million people in this country who have no sense . . . Besides the forty-five millions who have no sense, but a majority of votes, there are twenty-five millions who have a little sense. . . . Next there are twenty-five millions with fair-to-middling sense. They haven't much, but what there is, is good. Then lastly, there are a few over four millions who have a great deal of sense. They have the things we call "brains." '

Dr. Yerkes, who was largely responsible for the army tests, gets pardonably vehement in referring to such statements. 'Are they true?' he asks. 'No,' he answers. 'Is there any truth in them? Just enough to make them worse than false. They discredit psychology and mislead the reader in important matters of fact.'

What has all this to do with the problem of middle age? Simply that any age, no matter whether it is young, middle or old, is a matter of intelligence; also that there are in this country—as I have indicated—at this moment undoubtedly millions of men and women whose lives would, quite possibly overnight, be lifted up into new avenues of inspiration and happiness, could they but know how to conduct themselves; in short, what to do with their lives. My object in this brief article is to show them, not only what they can do, but also to guard them against too much advice.

The enormous number of advisers are in themselves a good indication of the desperate attitude of so many people, many of whom are trying so pathetically to renew their youth, to make themselves more beautiful, to start all over again, when the cure lies in themselves, and requires only a fair amount of first-hand thought, courageously carried out. For example, take the case of face-lifting. This operation is a very delicate one. At its best it costs five thousand dollars or more in the hands of the most skilful operatives in the world. One very prominent actress paid this sum to have it done and it was, apparently, a success. It was inevitable, of course, that her new face should be an advertisement of something which might mean rejuvenation for thousands of women.

Yet in the papers, thinly concealed, are appearing occasionally suits brought by unfortunate victims whose faces have been ruined for life by charlatans who thrive on this trade. The singular part of all this is that, as a cure for middle age, or even as a cure for anything, this operation amounts to nothing. As Bernard Shaw once remarked, after you have lived in the house with beauty alone for several days, you completely forget that it is there.

Now the fancied obstacles that confront middle age are that:

One is confronted with old age.

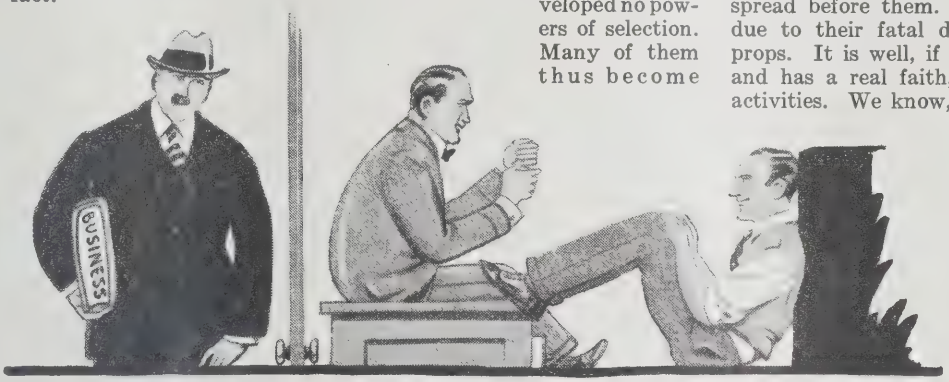
One is no longer beautiful, has lost one's attraction.

One is increasingly liable to disease.

One has no real occupation.

The facts are, of course, quite the reverse. No one who has had the opportunity to observe modern youth at close range can fail to be struck by its tragic note. The irresponsibility and crass selfishness of so many of the young folk of today, while not so bad as it appears, is due entirely to this tragic note. At no period in history has so much accumulated tradition, so much confusion in theory and education, flooded the adolescent human mind.

Thus we see hordes of young people actually sidestepping this flood of so-called knowledge, merely because they have developed no powers of selection. Many of them thus become cynics, many resort to crime, many frankly become pleasure-seekers. The few who are in earnest having been largely deprived of religion, the victims of a peculiarly disintegrating hedonism, drift along from one road house to another, utterly incapable of any continuous concentration.



There ought to be something better in life (as healthful as golf may be) than daily discussions on the pond hole and the weight of brassies.

The great majority of middle-agers are spared all this. They have at least found themselves. Their doctrine may be one of despair, but it is what they have come to regard as simple. They are growing old, they are likely to break down, they haven't accumulated enough, and so on. Worse still, they no longer look forward to that romance which they fondly imagine they have left behind. The fact is, of course, that right romance does not begin until you are middle-aged. The cubs know nothing of it. With the blasé attitude of adepts, they are tyros in love. They think they know everything. They really know nothing.

The French school—de Maupassant, Gautier, and the rest of the Gallic literary crew—have done more to discredit real love than any other collection of nit-wits. Most of them went crazy, some of them even in their own middle age. They used love as if it were a kind of make-up. Real love between two persons is continuous and progressive. Beauty in love is not a matter of cosmetics; it isn't concerned with face lifting. It is a matter of internal, spiritual beauty, based on give and take—sacrifice, if you will. Furthermore, the gestures of real love are based upon an eternal technique. It is only during the period of middle age that it is possible to know how to love. Yet consider the millions of mistaken persons who think that it is all over with them.

As for health, statistics are unavailable, but even superficial observations show us that youth is more ailing than middle age. It is the young people in my own family, and those I have observed, who fall sick. And why should this not be so? They have no mental direction. They do not know how to take care of themselves.

Now—also be it observed—taking care of yourself is not a fussy matter. It is not coddling. It is at best preserving a right mental attitude, of always being in control. The young people of today do everything to excess.

The real difficulty with too many middle-agers of the present day lies in their own blindness to the vast opportunities which spread before them. And this blindness is due to their fatal dependence on outside props. It is well, if a woman likes church and has a real faith, to engage in church activities. We know, however, that of late women have not tended in this direction.

When they do so tend, however, they should remember that they are too likely to give themselves up to this thing to the exclusion of everything else. Woman's intensity is her barrier to peace. It is very hard indeed for American women to lead temperate lives. I am not of course referring here to anything other than the mental urge which leads women to throw themselves at anything. And too often the object is not worth it.

So far as middle-aged men are concerned, is it not a satire on human nature when the most that can be said of too many of them is that they are headed straight toward the golf links? There ought to be something better in life (as healthful as golf may be) than daily discussions on the pond hole and the weight of brassies.

The conquest of middle age is so easy that it seems almost impossible to avoid the conclusion that too many of our middle-agers have missed out on their accumulation of practical intelligence. It does not lie altogether, as too many fondly assume, in 'doing good' to others.

That notion is being superseded by another, much larger, namely, that it is more our duty to make our own lives something beautiful, something self-contained, something which it is well for others to contemplate. We are coming to see that doing good to others often, too often, reacts upon them to their ruin, especially when, out of our own abundance, we make out of them wet rags instead of upstanding crash towels.

It is for them to live their own lives, while we—practising self-control, courtesy, courage, temperance, loyalty and health—furnish to all men an example of right living.

And if middle-agers cannot do this best, who can?

When France Got Back Her Favorite Daughter

(Continued from page 13)

and then for seekers of the picturesque). On the summit, therefore, are a restaurant and hotel as well as the nunnery (which has lost its rules and its solitude). From the terrace there is a scene of unusual beauty—there can be few finer in Europe—stretching as it does over the vast plain of the Rhine and to the farther blurred limits of the Black Forest. The summit is surrounded by a rampart called the 'Pagan Wall,' a vast construction measuring 10,500 meters in circumference and composed of enormous blocks of the red Vosges sandstone, so solidly packed that it has come down intact from the prehistoric epoch when the first inhabitants of Alsace, the Celts, made it as a refuge.

In the chapel are relics of Saint Odile; in the wall of the cloister is a 12th Century pillar; there is the little cemetery of the unknown nuns, and there is the low wall saving one from the abyss, which seems to be paved with the tops of tall trees—are these things on the mountain top not sufficient to awaken reverence? Goethe records his impressions of a visit he made as a student to the Ottilienberg, and Taine, the French philosopher, wrote, 'How quickly one is separated from human things on the height of these terraces . . . Things themselves are divine, and that is why one has to conceive Gods in order to express facts.'

At the foot of the St. Odile mountain are a number of small towns which have preserved much of their old-time charm—Obernai, with its fine 15th Century Hotel-de-Ville; Rosheim, with its Roman church—while all around is a circle of former fortresses.

It was from just this part of Alsace that a number of inhabitants came who helped to write a great page in the history of the United States. In this region was recruited in 1757 a regiment called the 'Royal Deux-Ponts.' Louis XV had authorized Duke Christian IV of Deux-Ponts to raise an infantry regiment; the officers were to be of the noblesse of Alsace and Lorraine. The regiment was quartered in various parts of France until 1780, when it embarked at Brest (two battalions of five companies each, in all 1,079 men) for America, where, as their records go, in the winter of 1780-81 they organized and built the defenses of Newport (Rhode Island), and in the following July took part in an offensive against New York, took Kindsbridge, reached Long Island Sound, and drove out the English. In September they were at the head of the assaulting column against the English redoubts of Yorktown and took them. On the signing of peace the regiment embarked at New York and came back to France.

The origin of Strasbourg Cathedral dates from the early centuries of the Christian Era, but the present structure was begun in the 10th Century, and in spite of forced labor and of the real devotion of the nobles, the clergy and the people, it had the most abominable ill luck, having for one thing been partially burned down five times in the course of fifty years. This sculptured marvel, with the infinite variety and delicacy of the lace work and other ornamentations in the famous pink sandstone, has no rival in its own style in the world. More ethereal than Rheims or Chartres, more delicate and at the same time soaring than many another splendid cathedral one could name, if there is one cathedral which by the mere contemplation of it could force the beholder to a rapt piety, it is assuredly Strasbourg. The famous clock tower attracts the attention of all tourists, but the real glory is the wonderful Gothic western façade and the spire.

The Cathedral of Strasbourg—a superb work of art and one of the greatest glories to Alsace.

Strasbourg is remarkable, on the one hand, for its old houses in narrow streets—picturesque indeed when the market women are there in their national costumes—and, besides, its fine large open spaces.

Next in interest to the capital is the town of Colmar, a setting of pretty architectural jewels, the most famous of which is the Renaissance *Maison des Tetes*. Colmar is the birthplace of Bartholdi, the sculptor of 'Liberty Enlightening the World,' and among other statuary there is a fine fountain of his here. Colmar is the center of excursions to the mountains and health resorts of the Vosges.

It was at Saverne, in the north, or on the summit of the hill beside it, that Louis XIV, as is related, visiting Alsace in 1681, paused and, looking at the scene before him—the plains, the mountains, the spire of Strasbourg, and the Rhine in the farther distance—burst into the exclamation, 'What a lovely garden!' It is in the region between Saverne and Haguenau that the inhabitants still preserve most jealously the old traditions and the costumes—the women the cap with the big butterfly ribbons, the men the red waistcoat with gilded buttons and the three-cornered hat.

Niederbronn-les-Bains, with its chlorated saline springs, was under the Empire a quite fashionable resort, but the Germans neglected it, fearing its rivalry with their watering places on the other side of the Rhine. And so we come to Mulhouse, which is the industrial capital of Alsace and the center (with Colmar) of the textile industry (spinning, weaving, bleaching, dyeing and printing).

It was with great interest, having for so many years watched and annotated this passionate desire of the French and the Alsatians to be united again, that I visited Alsace recently to see how the inhabitants were getting on under the restored French régime. The province has now thoroughly settled down to its new happiness, and the Alsatians are again Alsatians, a pleasant, open-hearted people who welcome the stranger and like at times to tell him things as well as to question him. The utmost liberty prevails, and only the other day the French Prime Minister Raymond Poincaré, who is himself from Lorraine, issued renewed instructions as to the use of the German language in the tribunals in parts where French is not so well known, while in the schools everywhere both languages are taught, and there is furthermore a real desire not to let the old dialect perish.

I had visited Metz directly after the war, when it seemed still to be cowed and shivering from the memory of recent events, when as yet one heard little or no French spoken, and at night one walked through the almost dark streets like a conspirator. What a contrast now with the bright, gay aspect of Strasbourg and Colmar! Everyone is satisfied, and there is every appearance of thriving trade.

The leading industries of potash, in the Upper Rhine province, one of Alsace's most important resources, the petroleum mines, and other activities, are forging rapidly ahead. Apart from politics, thinking Alsatians will not deny that the German

rule had its good points; the combination of French taste and culture with modern German industrial methods could not help but push forward the province materially. One old lady remarked slyly and smilingly to me, 'We like the French best, but under the Germans the trains were a little more punctual!'

Among the famous citizens of Colmar, a place already mentioned, was Bartholdi, who designed our own Statue of Liberty, and his home is pointed out to all Americans. Near the railway station is the 'Rue Wilson,' showing the sentiments of the inhabitants since the war. Near Colmar is Turckheim, the place where Marshal Turenne gained a decisive victory over the Germans in 1675 and expelled them from Alsace. The town itself is a sleepy little place, partly surrounded by its old walls, and with several towers. One of the old gateways, the Porte Basse, is remarkable with a creamy old stone tower.

I HAVE mentioned the two glories of Alsace; but coming down to smaller matters —though are they indeed, so much smaller? (the keen air of Alsace will tell you differently)—two more of its glories are the cooking and the wines. The care for the table has in Alsace always been highly developed and a matter of great pride, while the good cheer to be had in the province is testified to by *L'Ami Fritz*, the famous novel of Erckmann-Chatrain, and many another jolly book. It was at Strasbourg that *pate de foie gras* was invented, and it is from here that most of the *pate* eaten in the world comes. How it was invented by Close, the chef of Marshal Contades, in 1788 (so that it is about as old as the United States!), and for a long time made exclusively for him, until Close decided to commercialize his discovery, and married the widow of a confectioner—this is a history really as interesting as many a more august one.

Alsatian *foie gras* with Perigord truffles has been said with reason to be one of the supremest inventions on earth for man's inner comfort. A very big trade is done in it at Strasbourg, and in some of the central streets, where every other shop deals in this dainty, one is almost led to think the people do nothing else but make it. Also as we were touring about the province and passed repeatedly fine flocks of fat geese, I could not help remarking, occasionally, 'Look at that fine stock of *foie gras*,' at which my companion would turn her head away, and plead, 'Don't! Poor things!'

Choucroute—known to the Germans as sauerkraut—is another invention of Alsace, where it is made with an elaboration that brings cooking to the standard of a fine art indeed. But if one started to enumerate the various dishes, all excellent, that are indigenous to Alsace and due to the skill of its clever cooks—including 42 different varieties of *pates* and innumerable fish, meat and fruit dishes; and add the wines, which differ from the wines of the Rhine and Moselle (the wine culture here dates from as far back as the 14th Century, and Froissart related that Alsatian wines were in his time much appreciated in England), to say nothing of the liqueurs made from plums and cherries—well, one could launch out into a long chapter all of itself—and in truth, a very fascinating one too!

The Lustrous Lenglen

(*Continued from page 7*)

furnished enjoyment and entertainment that no other individual, or group of individuals, in tennis possibly could.

Women flock to see Suzanne. They marvel at her gowns, the creations of Jean Patou, and the way she wears them. They note the straightness of her back. They comment on her splendid figure. Because of this one manufacturer paid $35,000 to Mr. Pyle for the right to name certain of his dresses after Suzanne. Stockings, coats, perfumes, racquets and other articles bear her name and for each and every one of them royalty is being paid to Mr. Pyle, the man who induced this favorite of Aix and Deauville, Dinard and Dieppe, to join the ranks of professional athletes.

One may say without much exaggeration that for several years Mlle. Lenglen has been the best known woman of Europe. Her words, always frank and frequently undiplomatic, her thoughts, her clothes, her visits, her friends and companions, her plans, her loves and hates, her choice of wines and foods, her general likes and dislikes, her tantrums, her figure and her play on the tennis courts, have been subjects for comment and discussion in newspapers and periodicals. When it came to other champions of sport, people concerned themselves only with their play, but where Suzanne was concerned they were interested in everything she did and in everything about her, for Suzanne is more than the best woman tennis player of all time; she is one of the most interesting personalities ever connected with sport, this girl who first gained attention while leaping high against the sunlight that floods the azure coast of the republic.

Churches Are Building Skyscrapers

(*Continued from page 4*)

way for the skyscraper business buildings, as did Dr. Parkhurst's famous church which at one time dominated Madison Square, or build the same type of modern structure, put a cross on its tower, an auditorium in its heart, a pipe organ in its auditorium, a preacher in its pulpit, social workers in its program, or quit.

I am not an old man, but I have lived to see the day when Dr. Parkhurst's beautiful church gave way. I can remember that structure with the most distinct impression. It has gone. In its place rises a great business building surmounted by a beautiful tower. That tower might have been the tower of a church if the church had cared or dared to remain on the front lines.

It is one of the modern romances of life. Some of us believe that it is to mark a new era, not only in church architecture, but in the spirit of the church life. We know that it will create a new era in church finances.

The Grand Avenue Temple in Kansas City, and the Mizpah Temple in Syracuse illustrate the successful outcome of the temple type of church from a financial viewpoint. The former had an old building of the Gothic type, with a discouraged and dying membership, financially dependent upon other churches and missionary boards. They borrowed enough money to erect an office block in connection with a church auditorium, and an income of more than $35,000 a year after interest and fixed charges are paid is rapidly repaying the loan in addition to providing a preacher and staff of workers. It is now considered one of the successful churches of America.

That other or more important spiritual justification is adequately expressed by Dr. Christian Reisner, pastor of the new Broadway Temple:

'The Towering Church' has influenced all communities whether in China, India, in medieval Europe, or modern America. The temple has always been the prominent, impressive structure. By physical dominance alone can adequate architectural expression be given to the idea of spiritual dominance. The house of worship in our cities has been belittled in presence by the overpowering masses of surrounding commercial structures. It has lost the impressive character essential to the spiritual and moral predominance of the church which is now so greatly needed.

One actually has a feeling of pity as one looks upon a church of the old Gothic design, squatted down between gigantic skyscrapers.

But one has a feeling of tremendous awe and respect as he looks upon such a colossal Gothic structure as the Chicago Temple, dominating, as it does, the entire city; by day, with its impressive tower, and by night with its illuminated tower and cross.

Use Your Hands

(*Continued from page 3*)

trunk was pried up by skids . . . the logs were sometimes cut into cross-sections fifteen inches long, which was the legal length for shingles. These were taken home in a pung, split with beetle and wedge, and then finished off with a drawshave on a shaving-horse, itself homemade . . . repairs were made during this season, and a new cat-hole beside the door with a lateral working drop-lid, which the cat operated with ease, was made one winter. . . . box and figure four traps for rats and squirrels; windmills; weather vanes in the form of fish, roosters or even ships; an actual sawmill that went in the brook, and cut planks with marino and black and white Carter potatoes for logs; and many whittled tools, toys and ornamented forms and puppets . . . *How much all this has saved me since, in the laboratory, in daily life, and even in the study, it would be hard to estimate.*

Colleges are worried about the supremacy of football, while they have offered nothing for the muscles of the vigorous, active students on their registers. It is most natural that football, which provides the fundamental and racially old use of muscles, should gain the supremacy as long as in the classrooms the head is the only instrument of education.

Sir Isaac Newton was considered a dullard by his teachers, who also neglected the hands. Out of school hours he used his hands in making a water clock, a windmill, and a carriage. It was his self-education of his hands which gave the world his inventions in physics.

CHATS WITH OFFICE CALLERS

'You'd think there was a nickel famine in New York,' growled ***the Traveling Salesman,*** as he breezed into the office. 'It's the worst nickel-grabbing city in the country. You can't seem to get anywhere without needing a half-dozen or so of the small round coin, and what with the slot machines in subway and elevated railway stations, automat restaurants, telephone booths, and so on, if you don't freight your pockets with the right change before setting out, you're likely to be held up in dreary lines at the change booths every time you want to make a move. You may have anything in your pocket, from a dime to a twenty-dollar bill, but it won't do you any good in rush hours: you're delayed sometimes as long as fifteen or twenty minutes waiting for the small change to start you on your route.

'Railroads, restaurants and telephone companies bewail the big sums they lose yearly through lead slugs that are dropped in slot machines. The turnstile boxes in the subway have round openings on the inner side, into which are fitted magnifying glasses. Whenever a nickel is dropped into the slot machine by a passenger, the magnifier shows up the lighted coin, about three times its regular size. Watchers stationed on the platform can detect in a second whether the object dropped is a genuine coin or a metal slug. It seems like the pettiest kind of graft to cheat a slot machine, but all sorts of people seem to work the game.'

ɤ ɤ ɤ

'When I go out, I shall walk out quietly,' announced ***the Retired Lake Captain,*** making his first visit to the office. 'I left the lakes without being able to solve one mystery: why people crowd and hustle so when they are leaving a boat or a railroad car.

'I have seen them, on excursion trips, begin to cluster around the gangway when the boat was five miles from the landing dock. They get in the way of the crew. They hamper all the activity of landing. They jam themselves together uncomfortably in the hottest weather. If they find at the dock that they have clustered around the wrong gangway, that the passengers are to be let off at another, they are distressed.

'They jostle at the last minute, and leap to the dock as if the boat were on fire. Then I have seen some of these hurried people quietly take their places among the loiterers on the wharf, and watch the others land. They were not in any hurry at all. I cannot understand why they didn't remain in their chairs on the upper deck, and watch the others land. Then they could have come down and walked out in comfort.

'That is, to me, the unsolved mystery of the inland seas; more of a mystery than the hiding of Captain Kidd's gold.'

ɤ ɤ ɤ

The Traveler told us this one: 'At the large French prison at Melun one of the activities of the prisoners is printing. The official cards carried by detectives and by officers have been printed at this prison. Further, the secret ciphers of the war department have also been printed by the inmates. Some of these printer-prisoners have printed for themselves detectives' cards and police cards. Recently it was found that a Russian Communist had possession of the war department cipher, obtained from a released prisoner. In this connection the Paris *Times* (*Le Temps*) asks, "If one can no longer place confidence in the inmates of the Melun prison, in whom indeed can one confide?"'

ɤ ɤ ɤ

The Young Man came in extolling the merits of a hair restorer his barber had just recommended to him. 'All joking aside,' he said, 'it is becoming painfully evident in these days when women are becoming younger and more charming with each birthday that the husband who cultivates a shining pink pate and a gently curving abdominal protuberance does so at the risk of his marital happiness. Mere man has however attacked the hair problem scientifically. And the problem is growing to be one for women to solve too. Bobbed hair and tight hats are causing many to lose their "crowning glory."'

Indexes for Volume 26 of THE DEARBORN INDEPENDENT, *covering the period from October 24, 1925, to October 16, 1926, are available. The supply is limited. The price is ten cents a copy.*

ɤ ɤ ɤ

'I wonder if the gunmakers' lobby will be strong enough to procure the passage of the next shooting-ground bill,' pondered ***the Reformer*** as he seated himself in the dining car.

'They will if they make an effort to interest the right people,' replied the Politician.

'I suppose you think they didn't make an effort last year,' said the Reformer. 'Do you know that ammunition and gun manufacturers in the United States are doing an annual business varying from $33,000,000 to $46,000,000 and urging legislation favorable to the increase of that business? The American Game Protective Association is nothing more than an institution supported and maintained by the arms and ammunition interests. Dr. Hornaday says the Federal Government is in close agreement with the paid agents of the big corporations who make and sell guns and ammunition. And the lust to kill is being fostered by these ammunition makers. With the increase in the number of hunters, more deadly ammunition, more deadly arms, the powers of destruction, are increasing in inverse ratio to the number of birds and animals. Pump guns, telescopic sights and other improvements are going to mean the extinction of all game. They will all go the way of the Passenger Pigeon, which is now extinct.'

'Bill,' said the Politician, turning to the Sportsman at his left, 'You're a hunter and fisherman. What do you think about it?'

'I've thought a lot about it and sum it up in this way,' replied Bill. 'Perhaps the bill is subsidized by the munition makers. I don't know. I do know that some such bill should be passed or we will soon have no hunting at all. This thing is in the hands of the ones most interested, the sportsmen. The Izaak Walton League and the sportsmen at large, yes, even the ammunition makers, should combine for the common good and establish more game refuges. The ammunition makers and the song-bird advocates need to get together. And get this straight, friends. No conservation is real conservation that leaves out the sportsman. It is he who establishes reserves for game to multiply in, shooting only the overflow under restrictions. They watch their field and when it is too closely shot they pass laws restricting the bag limit, the season, and the like. Look at Pennsylvania. The state was practically denuded of game 30 years ago and today farmers are petitioning the legislature to let them shoot does because of their destructive tendencies. And in New York State, where sportsmen have brought back the game, the deer are thick as in days of old. Leave it to the sportsman.'

ɤ ɤ ɤ

'When I speak of conservation in Alaska I do not have in mind the dictionary theory of its meaning,' said ***the Old Prospector.***

'Except in name only, the dictionary meaning bears no more resemblance to the thing called conservation in Alaskan bureaucratic administration than a barren-ground caribou bears to a willow ptarmigan. Back in the nineties when I was in the university—oh, yes, I graduated from Yale in '95—conservation did not mean so much. We had plenty of natural resources and no one gave a thought to conservation. You ask me to state the present-day purpose of conservation in Alaska. I can say without hesitation that it has no other purpose than to supply a pretext, a sort of seeming justification, for the existence of bureaucratic jobs, and a plausible excuse for the innumerable junketing parties with which we are favored each summer under the guise of official business. It's the bunk. A fishing people look upon the Bureau of Fisheries as merely a useless adjunct to the fishing industry, with no one so humble as to do it reverence. Alaska has no friend at the court of public opinion in the States. There is a group, a business group, in the States opposed to Alaskan coal and timber and oil and their by-products coming into world competition with their own wares. Why we've got millions upon millions of feet of timber that is today dead and dying from old age and decay. But conservation keeps them from the ax. That's why so many come here, remain a little while, and then leave for places more remote where there is a chance to live a life untrammeled and unchecked by governmental red tape

CAN YOU TELL ME?

QUESTION: Did Columbus discover America? Is it not true that at least two men landed on America's shore before Columbus sailed from Europe?

ANSWER: A great many legends exist regarding European or Asiatic contact with the American continent prior to the 15th Century, and the landing of Leif Ericsson and his followers on the coast of Greenland, in the 11th Century seems to be fairly well established. These contacts led to nothing effective in the way of colonization or development, however.

QUESTION: What is the approximate amount foreign nations, industrial corporations, banking corporations and individuals owe banking corporations, trust companies, individuals, et cetera, in the United States?

ANSWER: American foreign investments total approximately $11,565,000,000.

QUESTION: How many spoken languages or dialects are there in the world? How many words are there in the English language?

ANSWER: There are said to be 3,424 spoken languages or dialects in the world, distributed as follows: America, 1,624; Asia, 937; Europe, 587; Africa, 276. The reputable English language contains approximately 700,000 words.

QUESTION: What is the area and weight of the earth?

ANSWER: The superficial area of the earth is 196,940,000 square miles—139,685,000 square miles of water and 57,255,000 square miles of land. The weight of the earth has been estimated at six sextillion tons, not including the atmosphere, whose weight has been estimated at more than five quadrillion tons.

QUESTION: Can you describe the President's flag?

ANSWER: The flag consists of the President's seal in bronze, upon a blue background, with a large white star in each corner. The design of this seal may be seen in the floor of the entrance corridor of the White House. When the President visits a vessel of the United States, the President's flag is broken at the main the moment he reaches the deck and is kept flying as long as he is on board. When the President is embarked on a boat he usually directs that his flag be displayed from the staff in the bow of his barge. When he passes in a boat flying his flag, vessels of the navy parade the full guard, four ruffles are given on the drum, four flourishes are sounded on the bugle, the National Anthem is played by the band, and officers and men salute.

QUESTION: Who was General Warren?

ANSWER: Joseph Warren, an early American politician, was born at Roxbury, Massachusetts, on June 11, 1721. He was a school-teacher, studied and practised medicine in Boston in 1764. The Stamp Act agitation aroused his interest in public questions. He soon became associated with Samuel Adams, John Adams and Josiah Quincy, Jr., as a leader of the popular party. He drafted the famous 'Suffolk Resolution' which urged forcible opposition to Great Britain if it should be necessary. He was a member of the first three provincial congresses and president of the third. During the war he took an active part in the fighting and was appointed major general of the Massachusetts troops in 1775. But before his commission was made out he took part as a volunteer in the Battle of Bunker Hill, where he was killed.

QUESTION: What is the sobriquet or by-name of Washington, D. C.?

ANSWER: Washington is known as 'The City of Magnificent Distances.'

QUESTION: Will you tell me how General Allenby was able to capture Jerusalem without firing a shot?

ANSWER: According to General Allenby's own account, with the taking of Gaza and Jaffa Jerusalem's defense was practically destroyed. The army rapidly advanced as the Turks were too much occupied on their extended front to concentrate vast forces on the new attack. With the news of the advancing British army, the Turks began to withdraw from Jerusalem. Finding the western entrance to the city unprotected, General Allenby and his army entered and without effort took possession of the city.

QUESTION: What are the ten longest rivers in the United States?

ANSWER: Missouri, 2,945 miles; Mississippi, 2,486; Arkansas, 2,000; Rio Grande, 1,800; Columbia, 1,400; Colorado, 1,360; Platte, 1,260; Red (south), 1,200; Tennessee, 1,200; Yellowstone, 1,100.

QUESTION: Is it essential that an alien reside in the same vicinity during the period between receiving his first and final citizenship papers?

ANSWER: No.

QUESTION: Does a foreign-born woman take the nationality of the man she marries?

ANSWER: No, not in the United States. She must take out naturalization papers.

In this department we shall do our best to answer questions concerning Government and kindred matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

QUESTION: Does an American woman lose her citizenship on marrying an alien?

ANSWER: No.

QUESTION: Article X in the League of Nations quite corresponds to Reservation V in the World Court, does it not?

ANSWER: No. Article X of the League of Nations reads as follows: 'The members of the League undertake to respect and preserve as against external aggression the territorial integrity and existing political independence of all members of the League. In case of any such aggression, or in case of any threat or danger of such aggression, the Council shall advise upon the means by which this obligation shall be fulfilled.' Reservation V to the World Court reads as follows: 'That the Court shall not render any advisory opinion except publicly after due notice to all States adhering to the Court, and to all interested States and after public hearing or opportunity for hearing given to any State concerned; nor shall it without the consent of the United States entertain any request for an advisory opinion touching any dispute or question in which the United States has or claims an interest.'

QUESTION: What is the duty of the Controller General of the United States?

ANSWER: The Controller General of the United States, as head of the General Accounting Office, is charged by law with the settlement and adjustment, independently of the executive departments, of all claims and demands whatever by the Government or against it, and all accounts whatever in which the Government is concerned, either as debtor or creditor, and is vested with all powers and duties previously conferred or imposed by law upon the former Controller of the Treasury and the six Auditors of the Treasury Department. He superintends the recovery of all debts finally certified by audited settlements to be due the United States, and the preservation of all accounts, with their vouchers, etc., which have been finally adjusted, and countersigns all warrants authorized by law to be signed by the Secretary of the Treasury. It is the duty of the Controller General to investigate at the seat of government or elsewhere all matters relating to the receipt, disbursement, and application of public funds.

QUESTION: What was the total number voting at the presidential election in 1920?

ANSWER: 26,674,171. This does not include blank or void ballots, or votes cast for names not on any ticket.

QUESTION: How large is the British Empire? What is its total population?

ANSWER: The British Empire covers about one-fourth (13,406,103 square miles) of the world's habitable land surface; this excludes the Arctic regions. Its population totals, according to the best obtainable estimates, 441,595,965 people.

I READ IN THE PAPERS

Under the heading, 'Academies, Universities and Schools,' the more important French dailies give academic notices. Since there are no football or baseball teams, in default of such real news, the academic side of the universities and learned academies receives attention. In the newspapers announcement is made of important discoveries in science, of completed literary works, of honors conferred and of appointments made; also of current lectures.

College News as It Is in France

Recently at the University of Lyon the chair of Greek Language and Literature became vacant. By a decree of the ministry of public instruction this chair has been transformed into a chair of English Language and American Literature. The first incumbent of the newly created chair is *Mlle. Villard,* made titular professor.

Very modest are the claims of a Jewish rabbi of Montreal, who has just lodged before the privy council, supreme court of the British Empire, his claim to the ownership of Labrador. He says Labrador was given to his ancestor Joseph de la Penhe, wealthy Rotterdam merchant and shipper, by William III of England. During a storm at sea this 17th Century Penhe is said to have saved the monarch and several members of his family when the ship was wrecked. As a reward he says the king bestowed a charter upon him and his heirs whereby they became the owners of the great tract of 511,000 square miles. The claimant is Rev. Isaac de la Penhe, synagogue preceptor of the Sepharpi (Spanish and Portuguese Jews).

He Lays Claim to All of Labrador

For twelve years Alvin Volberding, of Reinbeck, Iowa, was troubled with a continuous headache. While a soldier in the Philippines he had been kicked in the head by a horse. Doctors said he had an abscess of the brain and could not be cured. Recently the pain became unusually severe and upon blowing his nose vigorously he dislodged a piece of needle a half-inch in length which had become imbebbed in his nose. The pain ceased immediately. The needle had been left in his head by the army surgeon who sewed up the wound left by the horseshoe.

ɤ ɤ ɤ

There were Amazons in ancient times but they were not women. They were men who shaved and consequently looked like women to the bearded Greeks who first felt the sword at their hands. Archeologists have found representations of beardless men in the Hittite monuments on a plateau near the headwaters of the Sangarius River, the modern Sakaria, in Asia Minor. About 1250 B. C. the Hittites suffered reverses and no doubt thought this was due to their effeminate appearance. At any rate, from that date they shaved no more.

'My candle burns at both ends;
It will not last the night;
But ah, my foes, and oh, my friends,
It gives a lovely light!'

So wrote a frail little woman during an illness that darkened her life for months. She sought the solitudes of the great American desert of the Southwest. There she recovered her health and is now hard at work in the old Spanish city of Santa Fe, finishing her most ambitious effort, the libretto of *The King's Henchman,* an opera with music by Deems Taylor. She is Edna St. Vincent Millay, who under the name of Nancy Boyd is also known as a satirical essayist.

Price: 25 cents each; set $1. THE DEARBORN PUBLISHING COMPANY, DEARBORN, MICHIGAN.

Reform of the calendar has proved too tough a problem even for the committee of the League of Nations appointed to deal with it. After many months of study of the nearly 200 schemes of reform submitted to it, the committee came to the wise conclusion that public opinion was not sufficiently ripe for any action under the auspices of the League. So the whole subject was referred back to the countries interested for further discussion.

Too Tough a Job for the League

Judging by the sources of the suggestions for calendar reform, France is more interested than either Germany or the United States, and far more than England, which had only five plans before the committee, as against 33 from France, 27 from this country and 24 from Germany.

'A man's mind is his kingdom,' is an excellent Scottish saying. This old adage is again brought to mind by the sale of Robert Burns' letter to his younger brother, William, containing general advice concerning garrulity. Walter M. Hill, of New York, is the purchaser. It was part of the autograph and document collection of the late John H. Gundlach and brought $850. Burns advised his brother in part: 'What mischiefs daily arise from silly garrulity or foolish confidence! There is an excellent Scottish saying, that "a man's mind is his kingdom." It is certainly so; but how few can govern that kingdom with propriety.'

Robby Burns' Advice to His Brother

Somehow we always visioned Benjamin Franklin as a quiet, retiring old fellow given over to bookishness and the making of proverbs; one who would fit in nicely in front of a cozy hearth fire with a cat beside his rocking-chair, or in a French court bowing and working his way into diplomatic circles. We are surprised to learn that he was a hardy, outdoor man and an expert swimmer. On one occasion he swam for four miles in the Thames at London, performing many feats of activity, both in diving and swimming. In fact, he won such a reputation as a swimmer that at one time he thought seriously of becoming a teacher of swimming. At forty he swam for two hours at a stretch. And in the print shop he astonished his fellow workers by carrying two forms of type to their one. In short, he was an all-round man in every respect.

NOTES · COMMENTS · CRITICISMS

MR. FORD'S Page this week discusses the utilization of the Marines as the agents of the American people, not as a special police of the interests.

While the United States has been scrapping warships, other powers have been building more. Is this world disarmament, or is it the old fable of the fox and the goat? It will be remembered that the fox fell into a well and induced the goat to jump into the well also; then stepping on the goat's back the fox got out. The Navy Commission alleges that America has been made the goat. The 'Little Navyites' say no. But 'facts are chiels that winna ding,' thinks E. B. Jones. (p. 1)

Much sentiment has been spilt over the affinity of heart and hand. But head and hand, leaving out the sentiment, form a more important combination. Donald A. Laird works out this proposition by demonstrating that where the head alone is cultivated the hand lags, but when the hand functions the head acts in conjunction. (p. 3)

After all, the builders of the Tower of Babel had a big idea. They wanted to get as near heaven as possible. This is exactly what is now happening with the church builders in New York, Chicago, and other big cities. The sky pilots are erecting skyscrapers because material structures like these, when placed on a sound commercial basis, provide the means for carrying on and raising the standard of things spiritual. William L. Stidger finds this a congenial theme. (p. 4)

If men of middle age read Thomas L. Masson's article on the advantages of being just like that, without a thrill of rejuvenation, it will be surprising. Mr. Masson maintains that at middle age a normal individual has just stepped onto the road of greatest achievement. (p. 5)

Who has not heard of 'Suzanne,' the scintillating sylph of the ball and racquet? H. G. Salsinger provides some snapshots of her rapid-fire methods in the tennis game and explains how she attained them. (p. 7)

There is news that comes out of Washington and news that does not, says Aaron Hardy Ulm. We are left to infer that the negative side of this statement is the more important. (p. 8)

Following the Franco-Prussian War, France's greatest sorrow was the loss of Alsace-Lorraine. The Paris group of statuary symbolic of this province was draped in black. Following the World War this somber covering was removed. France's favorite daughter had been restored. Alsace, with its romance and chivalry, is depicted by A. M. Sommerville Story. (p. 12)

The remaining pages of this number are replete with subjects of interest. The final installment of 'Strange Men Who Could Not Keep Straight' contains a real human appeal. (p. 14) Burt McConnell, in 'The Balloon That Never Returned,' supplies all that is likely to be known about the Andrée polar expedition and its mysterious fate. (p. 16) Fred L. Holmes gives a graphic picture of Wisconsin's first circuit rider. (p. 21)

It is fine to have so many of our readers paying testimony to the manner in which this magazine lives up to its slogan of chronicling 'the neglected truth.' Here is a letter that shows gratifying appreciation:

West Grove, Pennsylvania.

Am sending my check for $1.50 for one year's subscription to your paper, THE DEARBORN INDEPENDENT, and want to say right now that we like it immensely—it is different from so many other papers and magazines—everything in it is interesting to such a large extent and we think that 'chronicler of the neglected truth' is a truthful slogan.

Have been much interested in everything about Abraham Lincoln as I am and always have been a great admirer of him and my husband has just been reading 'John Sobieski' with much interest. He was personally acquainted with him and heard him lecture here in our town over sixty years ago, and of course was delighted with the article, as it was correct in every detail.

I have frequently remarked that it was not often that one could find so much that was readable and interesting in one paper.

MRS. G. R. CHAMBERS.

Massinacac
Guinea Mills, Virginia.

Mr. A. H. Ulm, in THE DEARBORN INDEPENDENT for December 25, 1926, quotes an historian as saying that, 'After 1638, scarcely any (immigrants) came but those who were brought as merchandise to make sale of,' that is, indentured servants. Mr. Ulm refers to the immigration into Virginia. Now, it is quite certain that the bulk of the Cavalier immigration took place after 1638, for after the beheading of Charles I great numbers of Cavaliers left England for asylum in Virginia, where they settled and raised families. One of my own ancestors, Capt. John Batte, a royalist officer, came with his family, and this is one instance out of a great many. Few of Cromwell's men came to Virginia, for the colony was in control of the Cavalier stock.

As to the servant class, in 1670 there were in Virginia six thousand white servants, but thirty-two thousand free people. And it must be remembered that these indentured servants were not of the dregs of society; they were largely adventurous, courageous men who were willing to try life in the wilderness, and because they had not sufficient money to pay their ship passage, bound themselves to some landed proprietor until the sum was paid.—So, however the fact may be controverted, it seems undoubted that Virginia was populated largely and controlled by the Cavalier, the gentry class, of England. There are very few families of decent standing in Virginia today that cannot link up with some of these English gentlemen, and the pride of Virginians in their family is possibly unexcelled by the inhabitants of any other state. It remains one of the last provincial cultures despite the depletions of the Civil War, and the economic depression succeeding that conflict.

Allow me to congratulate you on the increasing goodness of THE DEARBORN INDEPENDENT. It manages to have something vital to say every week, which is no small accomplishment where there are so many periodicals. I am glad to see that THE DEARBORN INDEPENDENT does this without lowering its standard.

WILLIAM SHEPARD.

UNIV OF ILLINOIS
URBANA ILL

THERE are two ways of being happy. We may either diminish our wants or augment our means—either will do—the result is the same; and it is for each man to decide for himself, and do that which happens to be easiest.

If you are idle or sick or poor, however hard it may be to diminish your wants, it will be harder to augment your means.

If you are active and prosperous or young or in good health, it may be easier for you to augment your means than to diminish your wants.

But if you are wise, you will do both at the same time, young or old, rich or poor, sick or well; and if you are very wise you will do both in such a way as to augment the general happiness of society.

NOISE *the Destroyer*

By KNUD RASMUSSEN

Drawings by W. O. FITZGERALD

'I DON'T see how you stand the misery and bitter cold and arctic darkness.'

How often in my thirty years of polar work has this been said to me. My retort is always:

'Being buffeted by a polar blizzard can't compare with the assault of odors, sights and sounds of civilization!'

When I returned from my three-thousand-mile trip across the Arctic last year, King Christian of Denmark was kind enough to honor me. After the ceremony a man came up and said: 'You lucky dog! Even kings kneel at your feet!' Then he shook his head. 'But I would not pay the price you do,' he added with a shudder.

'What do you mean?' I asked mechanically. I knew, but was too fatigued to dispute him.

'Oh, the raw meat, the dirty Eskimos and the perils of the ice-pack,' he enumerated.

As I had just returned from New York after my trip down from Alaska I could not resist the temptation to throw his own words in his teeth:

'Raw meat, you say? My stomach prefers it to the overloading it gets now. Dirty Eskimos? At least they never jostle and crowd the way the white man does. And how about subways and taxicabs and elevators?'

He shrugged as if he thought my attitude an affectation. I went on:

'I don't deny the pleasure nor the honor of being a returned explorer. It is fine to have one's fellow man pleased with what one does. It is very warming to have the ladies admire one. But most of all this great pleasure is spoiled by the strain of contact with civilization.'

It is this strain, of which I am now so keenly conscious, that makes me realize so clearly under what terrific pressure the average man or woman is living today. I don't mean the strain of being agreeable to other people. That is a common handicap of society where two or more human beings are gathered together, whether it be in the arctic regions or in Times Square, New York. No, what I have in mind is something entirely different; yet something that concerns every man and woman in the civilized world today.

There are three things that assail me when I return after a long stay in the wilderness: my eyes are overwhelmed by the movement and variety of the kaleidoscopic scenes before me. My nostrils are wrenched by a thousand acrid odors of which the civilized man is not even conscious. My ears are deafened by the impact of myriad sounds.

Probably few persons realize that much of their fatigue and nervousness comes from eyestrain. Frankly, I never knew how unfair I was to my eyes until once when I came back from Greenland I happened to count all the different eyestrains in a day. My count ran up to a total of more than two hundred! Among the leading ones were: Reading in trains and taxicabs; watching traffic, both vehicular and human; reading while eating; street dust; bad light; reading advertising, night and day; watching flying landscapes out of train windows.

One would scarcely think there would be any sort of strain in catching and recording the innumerable smells, pleasant and otherwise, that reach the

The waiter collided with a brother servant. I half rose from my seat as the burden of crockery crashed to the floor.

I turned on the radiator. Instantly deafening reports issued therefrom.

nose in every day of city life. Yet I believe that this form of constant irritation plays a very definite part in wearing down the nerves of civilized men.

I remember a Dane going up to an Eskimo and saying, with a smile, 'I never smelled anything like you!'

The Eskimo promptly retorted, 'I wonder if I smell as bad as you do!'

I didn't realize what the native meant until I was away on a trip that kept me for more than two years completely out of touch with civilization. When I walked into a house on my return, I was astounded to find that I could pick distinctly from the mass of odors those of soap, fried food, bread, wood, stale grease, and a score of other things to which the civilized nose is numb.

But the most painful of all disturbances is noise. It is the Niagara of noise which pours from the city's gate which literally crushes me each time I return from the arctic regions. Primitive Eskimos whom I have brought back with me say the same thing.

'It's like the roaring of a great walrus herd!' one young savage put it.

There is first, of course, the din of traffic. Every vehicle that passes adds its measure to the cataract of noise pouring upon my eardrums. There is added to the surface traffic the roar of the elevated and the thunder of the subway.

In America I find myself shrinking from the constant tumult of building. I remember standing on a street corner in New York talking to a friend for some fifteen minutes. Above us riveters were hard at work on a thirty-six-story building. Despite the fact that I was not the slightest bit nervous either in temperament or in disposition at the time, I found myself forced to go and have a good cup of coffee after this experience.

Then there is the constant clatter of voices. People little realize how badly they pitch their vocal tones. They use more volume of sound than is necessary. They hammer the eardrums of their companions rather than titillate them.

My experience with the Eskimos has led me to realize how much better they use their voices than we do. In a snow igloo with twenty to thirty people around it would be perfect misery to sit or sleep if the natives shouted the way most civilized people shout. They talk in low, well-modulated tones; and if they are not heard they catch the attention of the other person with their eyes instead of hurling his name into the air.

I think a close-up of my sufferings in civilization would be enlightening.

It is because of my experience in coming back so many times after long trips that I feel myself, in effect, to be a laboratory case. I represent the human body naked to the agencies of civilized life. Through me the average person can see to what per cent his nerves and body are subjected by his daily passage to business and return.

I should like to add that my case is worth the consideration of the average man or woman if only because I find that physical and nervous strength are no true defense.

My own condition on returning from a long trip is usuall superb. My muscles are hard and my digestion good. My nerves and mind are as clean and sound as perfect health can make them. Yet the attrition of overworked vision, constantly annoying odors and noise, wears me out during the first few days after my arrival.

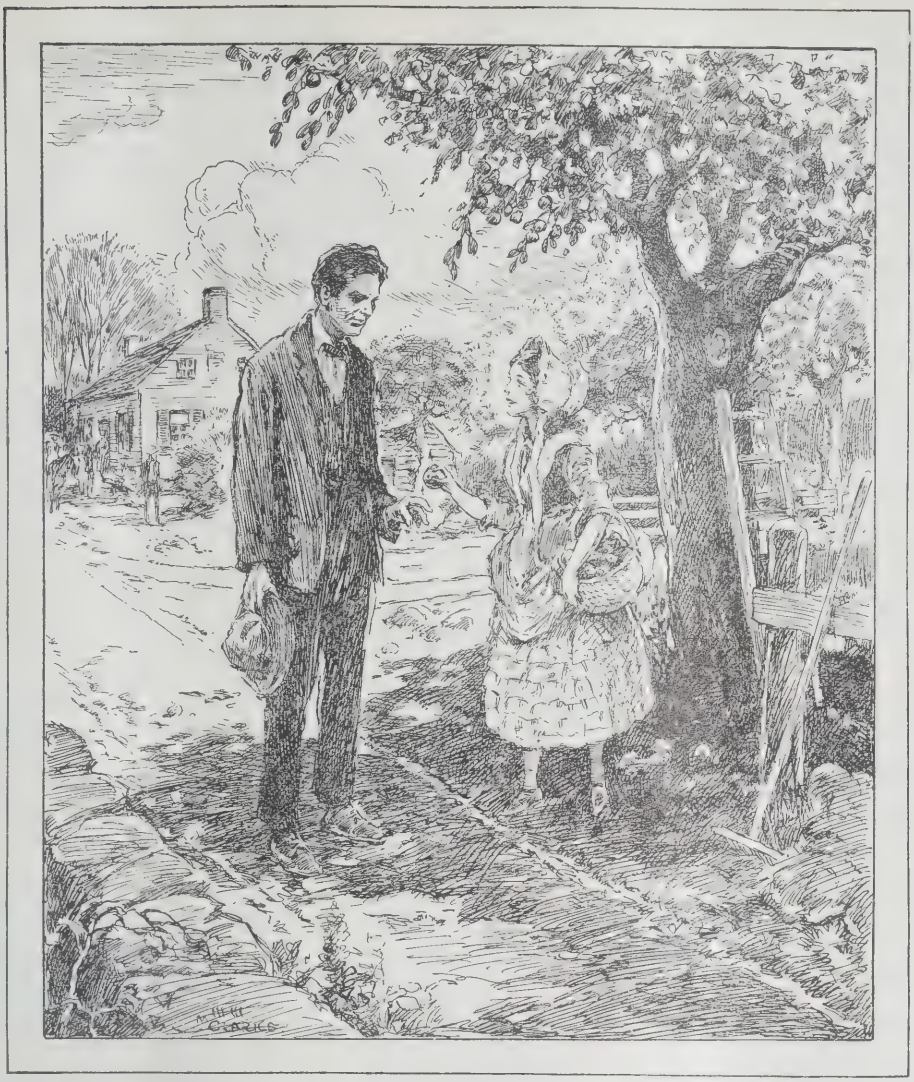
SOMETIMES, I seem to stand beside myself at such times and study how I feel. Two persons will engage me in conversation. Each will try to out-yell the other. One is talking to me about Greenland, the other about Denmark. I am quite unable closely to follow what both say. But the noise of their voices dins in my ears.

I watch myself stiffen slightly. If one ear is near one of the speakers I turn my head so that I don't get the full effect of the blast. The noise of the conversation not only takes the pleasure out of it, but reduces my ability to respond.

I sit in a taxicab. For a little while it is a relief to be out of the swirling movement. I feel as if I were in my padded cell. We stop. The creak of brakes behind me makes me sit up. A crash beside me makes me glance nervously out the window. When an elevated train goes overhead I shrink slightly. The peace *(Continued on page 20)*

I dine in a high-priced restaurant. The orchestra plays, making it necessary for me to yell.

By WILLIAM E. BARTON



Caroline Meeker was in the orchard. She met Abraham Lincoln, and offered him an apple.

The Girl Across the River
Lincoln's Friend at Court

THE case of Kentucky versus Abraham Lincoln was duly called, and the defendant answered to his name, and pleaded 'not guilty.' Both he and the complaining witness announced themselves as ready for trial, and the issue was joined. Abraham Lincoln was defendant in a number of lawsuits, in one of which he lost his horse and surveying instruments, but only once in all his life was he arrested, charged with a penal offense, and this was the time.

The magistrate, Samuel Pate, Esquire, justice of the peace in and for the County of Hancock and Commonwealth of Kentucky, took his office seriously. He had erected a large, double log house, somewhat recently completed before this trial, and he had built the east room of quite unusual size for the express purpose of holding court therein. In any reasonable weather, court might be held on the ample porch, and as a matter of fact was often held there; but the hewn log walls of Squire Pate's temple of justice suited his idea of the dignity of the law, and he preferred the trials to be held inside.

No sheriff or constable had dragged Abraham Lincoln into court; he had come voluntarily, but was guarded by the two complaining witnesses, or perhaps more accurately, by the complaining witness, John T. Dill, and his brother Lin.

It had not been the original intention of the Dill brothers that there should be a legal trial. They had intended to settle the issue out of court, and according to a method of their own. Lin Dill had stood on the bank of the Ohio River and hallooed across to Abraham Lincoln, and by repeated calls had induced him to row across the stream. The implication of the call was that some one wanted to cross the river and could not find the ferryman. That was a welcome call to Abraham Lincoln, and he got into his boat and crossed over. When he arrived, Lin Dill invited him to step out upon the bank, and Lincoln did so. Thereupon John Dill rushed out of the bushes where he had been hiding, and the two brothers seized the boatman with intent to duck him in the waters of the Ohio.

Although they had taken him at a disadvantage, and he was a prisoner in their hands, they held him in no such control as to assure them of success in ducking him.

He was a tough, tall, athletic fellow, and his muscles were like rawhide from chopping and rowing. If he was not a full match for two men, he was far more than a match for either one of his antagonists, and not helpless in the hands of the two.

Under these conditions a parley seemed logical, and with some heat on the part of the Dills, and good nature on the part of Abraham, it ensued.

John Dill declared that Lincoln had been taking away his customers, by running a ferry of his own across the Ohio River, Dill having a license from the Commonwealth of Kentucky, and being the only person legally authorized to convey passengers across. This, he declared, was contrary to law, and Lincoln was subject to arrest and fine; and he was due to receive a fine or a thrashing before he recrossed the river.

This suggestion Lincoln immediately acted upon. He told the Dills they might take their choice between the fine and the thrashing, but that if he stood trial, the worst that could happen to the Dills would be the losing of their case; whereas, if they attempted to thrash or duck him, something more serious might happen to them.

They told him that the house of Squire Pate was near; indeed, the ferry was operated from land owned by him. If Lincoln would go with them peaceably to the house of Squire Pate, and there submit to trial, they would not insist upon taking the law into their own hands. Abraham cheerfully agreed, and the three men climbed the bank together, and walked through the fringe of timber and the orchard, and past the little cemetery, to the big new house of Squire Samuel Pate.

Squire Pate was thirty-two years of age, and had a fertile and well-tilled farm. He owned slaves, and treated them well, and buried them, when they died, in a corner of his own little family

graveyard. He was a man who had inherited some property, and had added to it, and now, still in the vigor of his early maturity, was giving much attention to his duties as an officer of Kentucky. Some local magistrates make little of the honor or the office, but Squire Pate was not one of these.

Court opened without much ceremony, but not without a quiet dignity. The defendant waived service of a warrant, and the trial began.

John T. Dill, complainant, testified that he operated a ferry across the Ohio River, having license so to do under the laws of the Commonwealth of Kentucky; that he was the sole person who had legal right to set passengers across the river at that point for hire; that Abraham Lincoln, the defendant, had at divers times interfered with his business, notably in one case when he took a passenger from the Indiana side, and delivered

Illustrated by W. W. CLARKE

Court opened without much ceremony, but not without quiet dignity.

him aboard a steamer that stopped midstream, to the financial loss of Dill.

Lin Dill was sworn, and his testimony corroborated that of his brother.

Squire Pate heard this evidence with strong predisposition to find for the plaintiff. He knew the essential facts. The Dill brothers operated the ferry from land owned by him, and paid him rental. The Act of Congress under which Kentucky became a state gave that commonwealth jurisdiction of the Ohio River to high-water mark on the Indiana side. No Indiana license would have been valid. The Dill boys were neighbors, and the squire would prefer to please them; but he would not pronounce judgment till he had heard what the defendant had to offer.

Just then Squire Pate became conscious that others were present. A number of neighbors or strollers had heard of the trouble on the river bank, and had come over to see how matters were coming out. They were shown in by Squire Pate's negro servant, George, who was a year older than the squire, and outlived both the squire and his wife, serving the family till the war made him free, and still serving them and dying on the farm where he had spent his life, and being buried near his old master in the family cemetery. The little stone is there: George Pate, Colored, born April 23, 1794, died, May 29, 1867. That, and a hand pointing upward to the place where George had gone, tell the story of George.

Squire Pate suggested that if Lincoln would like to read the book, he might do so any time he cared to cross the river for that purpose.

But besides the neighbors and George, the squire was conscious of another presence, that of his niece, Caroline Meeker. She was an orphan, daughter of his older sister, and the squire was her guardian. She was seventeen, and had brown eyes, soft and winsome, eyes that sometimes lighted up with sudden fire. She had brown hair. It curled, and some of the curls fell over her forehead in rebellious fashion. Caroline was standing at the side of the room, and she was looking at the defendant, Abraham Lincoln. Her look caused Squire Pate to look again at Abraham Lincoln. And he was really deserving of the second look. The squire softened a little the judicial tone in which he addressed the defendant:

'Are there any witnesses for the defense? Does the defendant desire to testify?'

Abraham Lincoln rose to his full height. He almost knocked the floor beams above the court room, so tall was he.

He answered that he had no witnesses, and that the facts were as had been stated. But he would like to ask a question.

Squire Pate did not see what question there could well be, if the facts were beyond dispute; but he permitted the question.

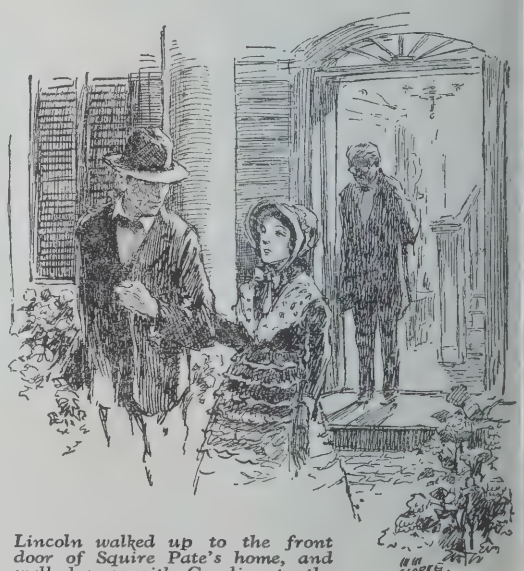
'The question I want to ask is, Do the rights of John T. Dill, under his license, forbid any other person to operate a ferry from the Indiana bank to the middle of the river?'

The squire replied that the entire width of the river belonged to Kentucky; but the defendant still pressed his point.

'It is not the right of the State of Kentucky to the whole width of the river that I question,' he said, 'but the extent to which the license of Mr. Dill applies to forbid traffic from the Indiana shore to vessels in the middle of the stream.'

The squire began to be interested. And Caroline was interested. She did not like the Dill boys, and it seemed to her that a very unmanly thing had been done in their setting upon Lincoln as they did.

'I did what these men say I did,' said Lincoln. 'A man came to the bank of the river to catch a passing boat. The boat could not land because of low water, but stopped in the middle of the river. John Dill was not in sight, and his boat was on the other side of the river. Somebody had to take that man from the Indiana shore to the boat, or the man had to miss the boat. The steamer would not wait. I was there, and the man offered to pay me to take him out to the steamboat, and I did. Now, it seems to me that it was not fair to expect me to sit there in my boat, and let that man miss his steamer, just because the Dill boys were not attending to their business. And I did not set the man across the river, as Dill claims the exclusive right to do; I only set him halfway across. And I'd like to know whether his license says that no one else must help a stranger to get on (*Continued on page 21*)



Lincoln walked up to the front door of Squire Pate's home, and walked away with Caroline to the husking party.

Are We Scrapping the Whole Navy?

By J. J. DEWEY

THERE has been a clash between the President and Congress. That is nothing new, but the country has witnessed the unusual sight of responsible men in the Republican Party openly disagreeing with a Republican President. It is all about the Navy. All is not well with our sea defenses and the men responsible under the Constitution for the national protection are anxious about the state of affairs. Who is right, the President or Congress? The facts will tell.

Gradually the people are coming to realize that the Washington Conference which was a step toward the attempt to abolish competitive armaments, fell very far short of its intention. While that failure may be attributed to a number of causes, much of it was due to a woeful lack of understanding of naval affairs exhibited by the American delegates and especially Mr. Hughes, and his inability to grasp the idea that Old World diplomats would naturally work along the lines of Old World diplomacy.

The completion of the 1916 Building Program would have given the United States Navy a sea force that *for the first time would have taken away supremacy from Great Britain.* A continuation of that program would have left Japan hopelessly out of the race, for at that time she was already spending almost fifty per cent of her total revenue on her military establishment. So the United States held the whip hand. That power was not abused; this country expressed a willingness to forgo its advantages if concessions would be made by all. The countries whose sea power was being eclipsed by the rise of the American Navy eagerly accepted. Then through inexcusable blundering and diplomatic cunning the American Navy was shorn of its power.

The excess of our strength lay in capital ships and destroyers, and our weakness was in auxiliary fighting craft, such as cruisers, aircraft carriers, destroyer leaders, cruiser submarines, tankers and tenders. The problem was to cut down where we were strong and to cut down the others where they were strong so that an equality or proportion might be reached. The idea of a fixed ratio as evolved by Mr. Hughes was to apply it to all types of ships. The sacrifice of capital ships on our part would be balanced by the sacrifice of auxiliary tonnage on the part of England and Japan. What happened at Washington was that superior diplomacy enabled our two competitors to emerge from the conference without sacrificing their auxiliary tonnage, and to accomplish at the same time the loss to America of capital ship supremacy.

The first box represents in ratio numbers what Mr. Hughes wanted to do, the second box what he accomplished and the third, the ratio with the completion of the building programs unaffected by the conference. No method of comparing fighting ships has ever been discovered that has satisfied naval experts, so no claim is made that the above figures represent an absolute standard. We do assert, however, that they are fairly indicative of the navies concerned. (*Continued on page 24*)

Face of the Brenner Medal.

LINCOLN in Marble and Bronze

By WILLIAM L. STIDGER

Reverse of the Brenner Medal.

LORADO TAFT once said that what our American sculptors needed to do, to rise above the spirit of frivolity and foolishness that these post-war days have brought upon us, was to 'get the hint of eternity back into their work.'

One of the methods by which American sculptors, plaque makers, and temple builders have of getting the hint of eternity back into their work is to express Abraham Lincoln in marble and bronze. In doing that they have doubly buttressed themselves by taking as a model an enduring character, of whom Stanton said, 'Now he belongs to the ages,' and by putting that character into the kind of material that time does not destroy.

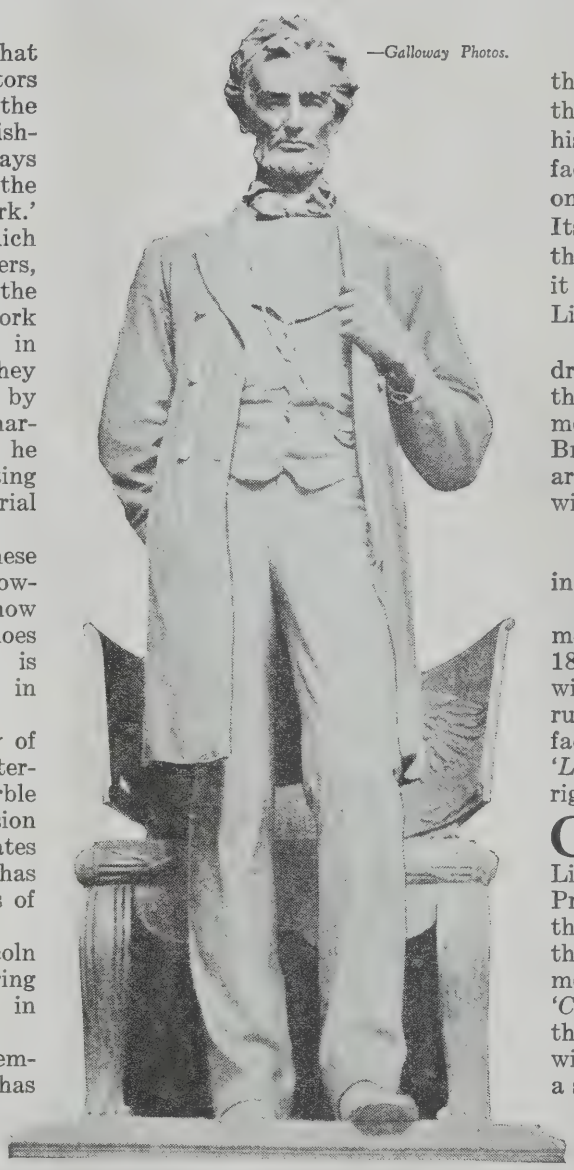
When Stanton made use of these memorable words, immediately following Lincoln's death, he little knew how true they were, for not only does Lincoln live in legends, but he is literally enshrined for the ages in marble and bronze.

One who makes a careful study of the penchant there has been to interpret Lincoln in bronze and marble comes to the immediate conclusion that the sculptors of the United States have never had a subject which has inspired so many truly great pieces of lasting art as Lincoln.

Sculptors have expressed Lincoln in three of the well-known enduring forms—in plaque, in marble, and in bronze.

The plaques of Lincoln are in themselves a fascinating story. America has celebrated every birthday of Lincoln with plaques. Some of them are masterpieces. Perhaps the best of them all, however, is the Brenner Bronze Medal of Lincoln, done by Victor D. Brenner. A poem on this medal, written by Frank Dempster Sherman, reads:

This bronze our noble Lincoln's head doth bear;
Behold the strength and splendor of that face,
So homely-beautiful, with just a trace
Of humor lightening its look of care.
With bronze. indeed, his memory doth share,
This martyr who found freedom for a race;
Both shall endure beyond the time and place
That knew them first, and brighter grow with wear.
Happy must be the genius here that wrought
These features of the great American
Whose fame lends so much glory to our past—
Happy to know the inspiration caught
From this most human and heroic man
Lives here to honor him while art shall last.



—Galloway Photos.

The celebrated statue of Lincoln by St. Gaudens.

There is surely a hint of eternity in the Brenner Bronze Medal, a hint which the poet has caught and imprisoned in his verse. The Brenner Medal has the face of Lincoln in relief, with '1809' on the left side and '1909' on the right. Its very simplicity makes it great, like the simplicity of the model after which it was cast. Not even the name of Lincoln is engraved.

During the celebration of the hundredth anniversary of Lincoln's birth, the Grand Army of the Republic had a medal struck off which is similar to the Brenner Medal except that it has around its rim his own words of wisdom:

'With Malice Toward None: With Charity For All,'

in relief lettering.

There is also a beautiful bronze medal by Volk, with the dates '1809-1865' to the left of the Lincoln face, with a lighted torch about an inch high running through these dates, Lincoln's face in the center, and the word *'Lincoln'* circling the medal to the right in rather large letters.

ONE of the more democratic of the Lincoln medals was that done by Pratt in silver, bronze, and copper, with the date 1909 in Roman figures below the head of Lincoln, and circling the medal above the head the words: *'Centennial of Abraham Lincoln.'* On the reverse side is the figure of an eagle with outspread wings at the top and a scroll at the bottom.

These medals were distributed rather widely in New York City and may still be obtained for a dollar each in coin shops. They are just a little larger than a dollar in size.

A prominent manufactory has put out one of the most delicate and beautiful plaques of Lincoln—his head in bas-relief of white marble on an octagonal piece of blue tile, without any lettering whatever. There is also a bas-relief by James W. Tuft, of Boston, that is striking in its bare

outline and in its simple strength.

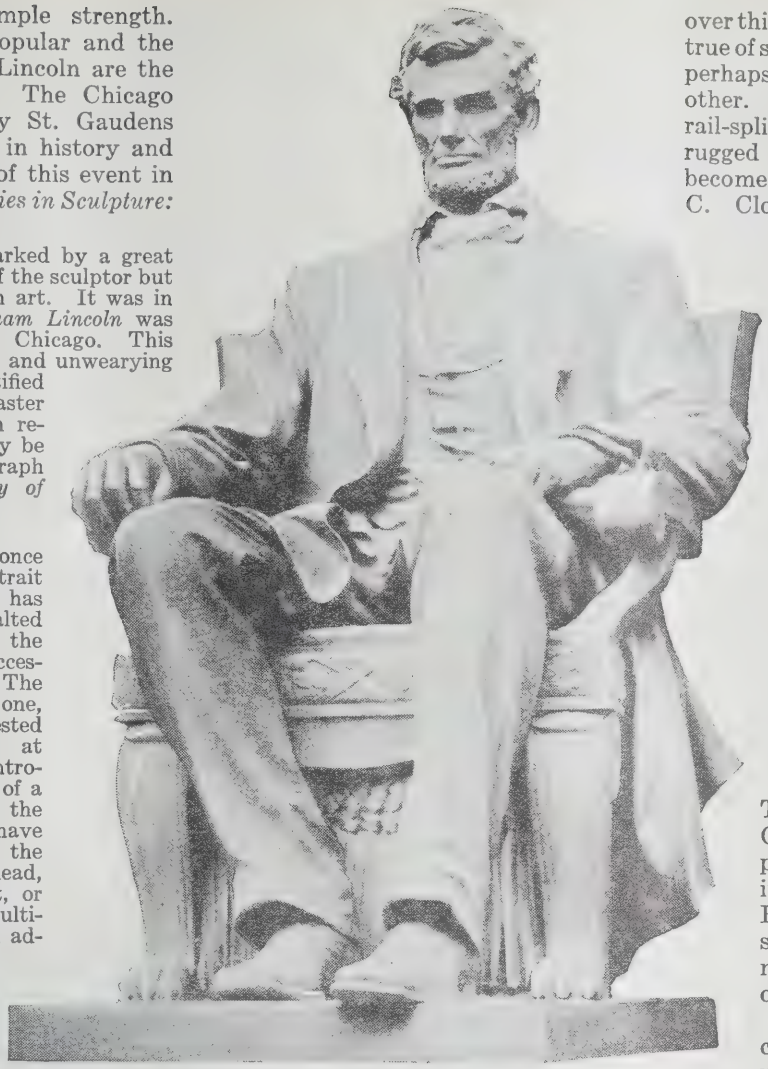
Perhaps the most popular and the best-known bronzes of Lincoln are the St. Gaudens *Lincolns*. The Chicago Lincoln Park statue by St. Gaudens was hailed as an event in history and art. Lorado Taft says of this event in his book, *Recent Tendencies in Sculpture:*

The year 1887 was marked by a great event, not only in the life of the sculptor but in the history of American art. It was in that year that the *Abraham Lincoln* was unveiled in Lincoln Park, Chicago. This product of profound study and unwearying experiment instantly justified all of the toil which the master had lavished upon it. In regard to its reception I may be permitted to quote a paragraph or two from my *History of American Sculpture:*

'The *Lincoln* was at once hailed as the greatest portrait in the United States. It has remained so. From its exalted conception of the man to the last detail of its simple accessories it is a masterpiece. The sculptor's idea was a novel one, which may have been suggested by Mr. Volk's *Lincoln* at Springfield, Illinois. He introduces the striking adjunct of a large chair, from which the President is supposed to have risen. Before it stands the gaunt figure with bowed head, as though lost in thought, or preparing to address a multitude. The left foot is well advanced; the left hand grasps the lapel of the coat in a familiar gesture. The right is behind the back, affording an agreeable but inconspicuous counterbalance to the droop of the head. It has been pointed out that the bent arm gives interest to the lengthy front and at the same time suggests an arrested movement of the hand to the brow, thus reinforcing the idea of concentration of mind.

'But it is the expression of that strange, almost grotesquely plain, yet beautiful face, crowned with tumbled locks, which arrests and holds the gaze. In it is revealed the massive but many-sided personality of Lincoln.

'I remember what a surprise that empty chair gave us. It was so daring—so strange! One had only to image it eliminated, however, to realize promptly how essential it was in the composition. Seen from a distance the figure without it would show but a meager and attenuated mass. Reinforced by this accessory the silhouette becomes ample, monumental. The bowed head and the broad shoulders—that combination of tenderness and strength which is the greatest thing possible in art, as indeed it is in life—are the introduction to a completeness of expression appealing to every heart.'



Statue of Lincoln at Hodgensville, Kentucky, by Adolph Weinman.

A replica of the Chicago St. Gaudens *Lincoln* stands in the shadow of Westminster Abbey, London.

The next best-known *Lincoln* bronze is that by Barnard. It is better known than the others because of the controversy that raged over a replica of the original which was presented to England, and which was finally placed in the manufacturing city of Manchester; perhaps a most appropriate place for it—among the common working people whom Lincoln loved.

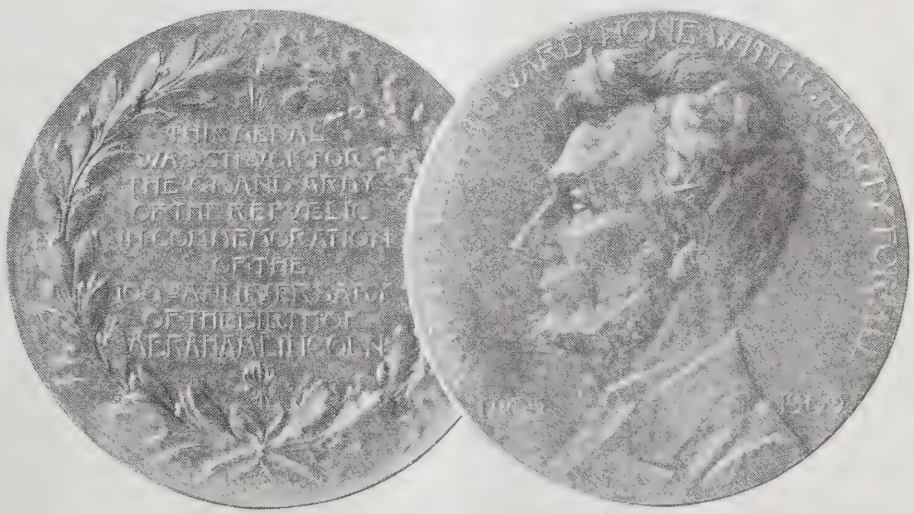
The original Barnard *Lincoln* was cast for the city of Cincinnati as the gift of Mr. and Mrs. Charles P. Taft to the city of Mr. Taft's home. President William Howard Taft made the address at the dedication. An art war raged over this particular statue. This has been true of several of the Lincoln statues, but perhaps more over this one than any other. Barnard tried to interpret the rail-splitter in this gaunt, ungainly, rugged figure, with which we have all become familiar by this time. Robert C. Clowry, then president of the Western Union Telegraph Company, said of this Barnard statue:

'The Barnard statue is a beautiful piece of workmanship, and a perfect likeness of Mr. Lincoln. I was well acquainted with Mr. Lincoln during my residence at Springfield, Illinois, before the war.'

When the wind of war among the artists had finally died down, and the popular newspaper controversy had quieted, the Barnard statue was placed in Manchester, England, and the St. Gaudens statue near the Abbey. No person who loves the spirit of appropriateness will question the final decision on this matter. The more formal, stately St. Gaudens fits into the atmosphere perfectly, while the more informal, the more ungainly Barnard *Lincoln* has a perfect setting, and is in perfect harmony with the industrial city of Manchester.

Next in point of popularity comes the Gutzon Borglum statue of Lincoln, sitting on a bench—the lawyer—which is located in Newark, New Jersey, in front of the court house. This statue was unveiled Memorial Day, 1911. It was the gift of Amos H. Van Horn, whose will set aside a gift of $25,000 for a Lincoln memorial to be dedicated in memory of Lincoln Post, No. II, Department of New Jersey, G. A. R., of which he was a charter member.

This statue is *(Continued on page 19)*

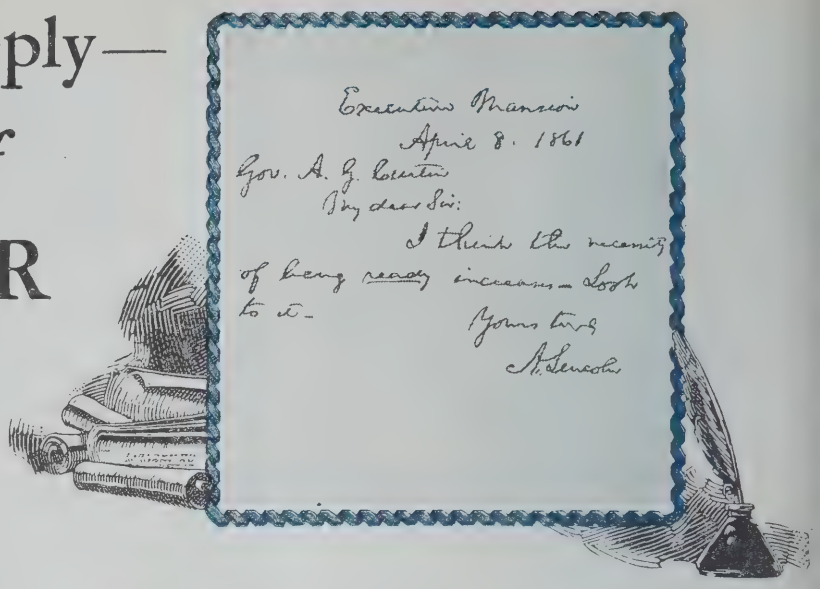


The faces of the J. E. Roine Medal.

A Letter and a Reply—

The Opening of the CIVIL WAR

By LOUIS C. KARPINSKI



THE LETTER

Executive Mansion,
April 8, 1861.

Gov. A. G. Curtin,

My Dear Sir:

I think the necessity of being *ready* increases. Look to it.

Yours truly,
A. LINCOLN.

THE RESPONSE

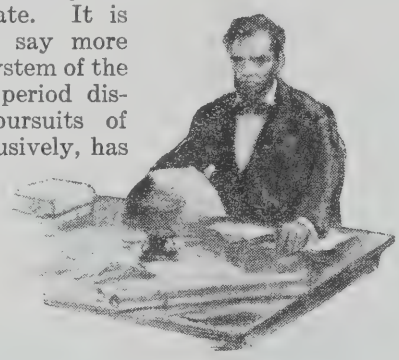
Governor Curtin's Message to the Pennsylvania Legislature.

Executive Chamber,
Harrisburg, April 9, 1861.

To the Senate and House of Representatives of the Commonwealth of Pennsylvania:

Gentlemen:

As the period fixed for the adjournment of the Legislature is rapidly approaching, I feel constrained by a sense of duty to call your attention to the condition of the military organization of the State. It is scarcely necessary to say more than that the militia system of the State, during a long period distinguished by the pursuits of peaceful industry exclusively, has become wholly inefficient, and the interference of the Legislature is required to remove its defects, and to render it useful and available to the public service. Many of our volunteer companies do not possess the number of men required by our military law, and steps should be forthwith taken to supply those deficiencies. There are numerous companies, too, that are without the necessary arms, and of the arms that are distributed but few are provided with the more modern appliances to render them serviceable.



I recommend, therefore, that the Legislature make immediate provision for the removal of these capital defects; that arms be procured and distributed to those of our citizens who may enter into the military service of the State, and that steps be taken to change the guns already distributed, by the adoption of such well known and tried improvements as will render them effective in the event of their employment in actual service . . .

Precautions such as I have suggested are wise and proper at all times in a government like ours. But especial and momentous considerations, arising from the condition of public affairs outside the limits, yet of incalculable consequence to the people, and demanding the gravest attention of the Legislature of Pennsylvania, invest the subject to which your action is invited by this communication with extraordinary interest and importance.

We cannot be insensible to the fact that serious jealousies and divisions distract the public mind, and that in portions of this Union the peace of the country, if not the safety of the government itself, is endangered.

Military organizations of a formidable character, which seem not to be demanded by any existing public exigency, have been formed in certain of the States. On whatever pretexts these extraordinary military preparations may have been made, no purpose that may contemplate resistance to the enforcement of the laws will meet sympathy or encouragement from the people of this Commonwealth. . . .

Pennsylvania offers no counsel and takes no action in the nature of a menace. Her desire is for peace, and her object the preservation of the personal and political rights of citizens, of the true sovereignty of States, and the supremacy of law and order.

Animated by these sentiments and indulging an earnest hope of the speedy restoration of those harmonious and friendly relations between the various members of this confederacy which have brought our beloved country to a condition of unequaled power and prosperity.

I commit the grave subject of this communication to your deliberation.

A. G. CURTIN.

This was the response to Lincoln.

Other war governors began likewise to make the necessary preparation. There were sixteen governors of the northern states, the so-called war governors, upon whose services absolute dependence could be placed. Their names are worthy of honorable remembrance. They were:

Edwin D. Morgan of New York
Charles Olden of New Jersey—highly loyal
Andrew G. Curtin of Pennsylvania
Oliver P. Morton of Indiana
Samuel J. Kirkwood of Iowa
Alexander Ramsey of Minnesota
Austin Blair of Michigan
Richard Yates of Illinois
Wm. Dennison of Ohio
Alexander W. Randall of Wisconsin
John A. Andrews of Massachusetts
Israel Washburn of Maine
William A. Buckingham of Connecticut
William Sprague of Rhode Island (led his troops to Washington).
Ichabod Goodwin of New Hampshire
Erastus Fairbanks of Vermont

Meanwhile dispatches were flying between Washington and Charleston, and between Montgomery, the capital of the Confederate Government and Charleston. These dispatches show the steps leading up to the 'war between brothers.'

The correspondence is taken from the New York *Herald* of April 13, 1861, and reads as follows:

Important Correspondence

Communications between the Confederate Secretary of War and General Beauregard. (*Continued on page 25*)

MR. FORD'S PAGE

OF THE DEARBORN INDEPENDENT

THE misuse of power is a constant note in the story of mankind. We may hope that so much misuse means a greater accumulation of knowledge concerning Right Use. The teacher whom we call Experience has taught every generation and many individuals that power misused is power destroyed. There has been through the generations a continuous growth of true power rightly used, and a continuous decrease of misused power.

The possession of power is not the sign of deserving it, but the right use of it is. And the right use does not mean a soft use; it means such a use of it as appears to be good after a careful appeal to one's best wisdom; it means a constructive purpose even in apparently destructive action. The right use of power has nothing personal in it, either for the satisfaction of ambition or revenge. He who turns aside to use his power for personal ends of spite or gain has set in operation the law by which his power begins to vanish.

It would be impossible without being pedantic to classify all the forms of human power, but they range from that of the parent over the child or the child over the parent, the power exercised by one in any group, however motley or obscure, to the more impressive exhibitions of personal, corporate or political power. But it is true of all of them that, used for purposes of personal selfishness in any form, power vanishes.

The probable reason for there seeming to be so much pettiness in power is that the contrast between the two is doubly emphasized by power being present. Plain instinct tells us that with power goes generosity of attitude, or that it should so go; and when it does not, the whole sensitive and sustaining thought of man with reference to power is broken.

And yet, if one were to gather up the abuses of power now evident throughout this country alone, the conclusion would almost be forced upon one that humanity shows more character when powerless than when powerful.

The instinct to crush a rival is the pettiest expression of power. It is more general than we would suppose. Here is a man, for example, who runs a bank. He is that type of banker who tries to understand the principles of finance. He is not satisfied merely to master the routine of deposits and checks, loans and notes; he wants to know the deep things of Money, solve if he can its mystery. There are some bankers content to do the daily business with as little thought to what lies behind it as a ribbon-counter clerk gives to the textile industry that lies behind the ribbon.

Such a man, unsuspecting, is putting himself in a splendid position to feel the pettiness of power. For there are certain to be presented to him proposals which could originate only in the broker and gambler type of mind, and as these are sometimes closely bound up with the desires or program of official banking authority, to refuse them marks a man as 'not regular.' He thinks for himself. He is a banker, not a clerk for a higher clique of men who call themselves bankers but who are often in quite another line of business.

Now, the story of such cases is full of illustrations which show how a waning power proceeds to act. It has but one rule in such cases—'crush him.' It is war, far less honorable, less humane, more horribly unfair than that waged by military forces. The encircling movement, the treachery and coercion, the quick pouncings at moments expected to produce the greatest confusion, the burglarious concentration upon taking away from the man all that belongs to him, would make a great novel if the people knew enough about Money to be able to read it.

That is one way in which power is misused, but it is not all one-sided. He who misuses loses more than he who is misused. For every misuse of power lowers the pressure of that power, stops up its sources.

Taking it generally, it is a misuse of power to impede a rival, because it is an interference in a field that does not belong to him by one who has no right to interfere. Every man has enough to do in his own field. There are certain laws which deal with these matters, and they deal harshly with anyone who seeks to usurp their place. The great danger of competition that has only the competitor in view is that both competitors sink to the level of an altercation, while the public seeks elsewhere. Competition in the sense of rivalry in service is another matter; it is competition with the good of the public in view, and under this form of competition all competitors and the public are benefited. But the 'crush my rival' kind is doomed to trip itself for a hard fall.

A pricking consciousness of power signifies that its possessor has very little; a boastful use of power signifies that the boaster will not have his power for long; a malevolent crushing use of power signifies that in the end a man's own power will crush him. He will be the ultimate loser.

THE 'crush my rival' kind of competition is bound to come to grief. A boastful use of power is a sure sign that the boaster will not long possess it. When power is used to crush, the one who ultimately suffers is the user. Nevertheless the right use of power does not mean a soft use; it means a deliberate use after due consideration of the constructive results. Power must be used for the good of the whole, not for the gratification of personal ambition or revenge. The surest way to lose power is to misuse it. A generous attitude should go with power; if not, the power will be broken.

'Ford Ideals,' 452 pages, cloth bound, contains 98 of these articles. Postpaid $1.00.

EDITORIALS

OF THE DEARBORN INDEPENDENT

They Protected Landis

THE action of the American League in protecting Judge Landis from a face-to-face encounter with Ban Johnson showed great tenderness of heart and not a little anxiety lest too much truth should come out. Anyway, the club owners were much more charitable with the judge than the judge was with the players, Cobb and Speaker. The players were bawled out and scandalized before the public without a hearing; Judge Landis was about to be given a real hearing —in two senses—by Ban Johnson. But the club owners met the day before the show-down and prevented what might have been an epochal comedown for Judge Landis. The Supreme Court of the United States once made Landis look like a pygmy in reasoning and practice, and the Supreme Court of American Public Opinion has practically repeated the verdict.

It was due to baseball that after the scandal had been released to the public it should have been settled in public view. The removal of Ban Johnson the day before the expected settlement looks a little like cowardice. Owners of baseball clubs are not necessarily good sportsmen. But Ban Johnson has always been known as a real sportsman, which connotes an honest and courageous man.

What Is a Good Book?

LET a good book be taken to mean a book which achieves immortality for its maker.

Scanning the titles of books and the names of their authors, you will find that those which have lived are those with some outstanding character or characters. You think of Thackeray, and Becky Sharp leaps to mind. Dickens suggests Pickwick; Irving, Rip Van Winkle; Hawthorne, Judge Pynchon; Trollope, Bishop and Mrs. Proudie; George Eliot, Silas Marner. These, and other characters, are put upon the pages exactly as in real life, with their opinions, their very thoughts, as evident to us as if we lived in their presence. Their actions grow out of their natures, and the action of the book grows out of the collision of character with character, with subordinate characters influenced by them. And so it is in life, action growing out of conflict.

On the other hand, you will find yourself unable to remember any vivid character in books where the interest depends upon plot, and where, instead of real and living characters, the acting is done by lay figures and puppets. Who, offhand, can name the leading characters in Charles Brockden Brown's *Wieland,* in Fergus Hume's *Mystery of a Hansom Cab,* in Frank R. Stockton's *Great Stone of Sardis;* in any book by D'Arblay, or Maturin, or Gunther, or Mrs. Roche, or George Walker? Yet all these had a vogue in their day.

Character makes the book as it makes the man.

China Whither Bound

PLEASANT or not, the reality must be faced that civil war is on in China—a civil war that may affect the course of world events as vitally as did the French Revolution a century and a half ago. It has passed the stage of mere banditry and has entered upon a new phase of international significance. Attempts to classify it with the Boxer uprising of twenty-five years ago are futile: that consisted largely of sporadic rioting, albeit of inhuman cruelty; this is a struggle for dominion of an empire. Whatever the outcome, the nationalistic spirit has grown to such proportions among men of all armies that foreign dominance will be seriously threatened, if not definitely challenged by arms. Students of world affairs tell us that the great war of the future will see the peoples of the East arrayed against those of the West in a struggle which will dwarf all those that have gone before. Whether their alarm is warranted or not, the present situation can easily sow the seeds of future hatreds and future wars. It is a situation demanding utmost diplomacy and utmost fair-mindedness.

Into this situation Secretary Kellogg's statement of American policy fits admirably. The sympathy of the United States for China's 'nationalistic awakenings' is expressed. The fact that this nation has no concessions in China such as are held by other nations is stressed. Strict neutrality is averred between warring factions. Special privileges, monopolies and spheres of influence are specifically rejected, and this Government is held ready to restore complete tariff autonomy to China. Further, the United States is ready to relinquish extraterritorial rights *as soon as China is prepared to provide protection by law and through her courts to American citizens, their rights and their property.*

This last phrase holds the nubbin of the American policy. For years no real government has existed in China; the country has either been ruled by war lords little better than the bandits they pretended to oppose, or it has been gripped by anarchy. When anarchy is suppressed and a government of law and order installed, the United States stands ready to recognize China as a sovereign nation and to abrogate unequal treaties. Until such time, this Government must reserve the right to protect its citizens.

Official Figures Tell the Story

THE official statement of the United States Treasury, as of November 30, the last issued at this writing, summarizes the condition of the bonded indebtedness to be on that day:

Gross debt	$19,524,071,481.96
Available cash	139,392,515.73
Net debt	19,384,678,966.23

Matured (not accrued) interest is included.

Approximately $520,000,000 of maturities were to be met in December. Revenues to December 15th quarterly settlement day, increased the available cash to a point which decided the Treasury that by borrowing $229,000,000 it could reach the March settlement day.

This information is printed for two purposes: to give an exact knowledge of the nation's bonded indebtedness, and to substantiate the claim this magazine has always made, that, instead of a surplus in the Treasury, we face a deficit all the time, and efforts to reduce Federal taxation should be confined to the correction of inequities and unjust assessment.

Because the Federal Revenues exceed normal expense, Secretary Mellon describes the balance available for debt reduction as a 'surplus.' Our disagreement with him has been merely to insist that if gross receipts are shown on one side of the balance sheet, gross expense requirements should be included on the other.

It will be seen that the Treasury itself takes our view of the matter, and sets off the 'surplus' against the gross debt.

Where Honor's Due

IT IS more widely commented in conversation than in the newspapers that the comic strips of the dailies are showing vast improvement; so much so as to render the adjective 'comic' no longer descriptive. There can be no such thing as a daily 'comic,' for comicalness is not of so frequent occurrence. It is incidental, even accidental, and does not partake of continuous quality and infinite variety as does humor. The comic strips, therefore, have apparently decided that it is a good bargain to exchange an uninteresting alleged comicalness for a genuine interest—for it is a fact that the new pictures gain interest. The comic strip lost public interest because it was not interesting; it was not interesting because it was not comical, any more than a mechanical clown is comical. The improvement has come in the way of increased interest-value, and this has been attained by a closer presentation of life as the majority of the people live it and think it. We now have the salient parts of history in 'strips,' the history of campaigns and sciences. Then we have the best kind of thrills, the thrills which come to an adventurous nature straight up against the difficult realities of life. Boys making their way in life have been the subject of 'strips' that have commanded the interest of millions of adults as well as youngsters, while Ella Cinders has a larger following than Lita or 'Peaches.' The old-time artificial 'comic' characters are falling into the background since the arrival of these newer and more natural characters.

Congratulations are due a good many dailies in this country for the improvement of their 'comic strip' pages. It is the duty of those of us who have been critics to make acknowledgment of the improvement.

The Chief Justice Speaks

THERE is something to be said in favor of Chief Justice Taft's suggestion that grand juries be abolished. In recent years the nation's judicial system has been growing increasingly ineffective. Political interference has seeped into the courts, particularly in the larger cities. Both corruption and intimidation have been attempted in the blocking of justice, with not a little success. The grand jury, as perhaps the weakest link in the chain, has been the focal point for many of the attacks from the outside. Cases are not unknown where grand juries have been tampered with, where indictments have been refused or the charges against criminals so mitigated as to be comparatively inconsequential. Insofar as it would remedy this condition, Mr. Taft's proposal to have indictments superseded by 'informations,' filed by state's attorneys following investigation, would no doubt prove beneficial.

But those who believe that the mere abolition of one functioning body such as the grand jury would prove a panacea for all judicial ills are living in a fool's paradise. Most remedies for the present intolerable situation center in the juries, petit and grand, as the most vulnerable spots in the whole system. But surely reform within the juries should be attempted before abolition. The elimination of silly court procedure and technicalities would do much to relieve the situation. Consider just one phase: the rule that prospective jurors shall not have read or heard mentioned the case to be tried. Why such a rule should still be in force in these days of newspapers and radio and public discussion—a rule which bars virtually all except morons and illiterates—surpasses the understanding of the lay mind.

One more element must be included in any consideration of the disintegration of justice. Observance of law comes through respect for the law, and for the courts which administer the law. When that respect is gone, one of the fundamental supports of good government is gone. Turning the courts into showrooms for the morbid and the salacious—witness the Hall-Mills and the Browning trials—goes far toward destroying that respect.

Mrs. Lincoln and her younger sons, 'Tad,' on right of picture, and 'Willie' on left.

Julia Taft Bayne *Recalls* Good Times *in the* WHITE HOUSE

IF THERE was any motto or slogan of the White House during the early years of the Lincolns' occupancy, it was this: 'Let the children have a good time.' Often I heard Mrs. Lincoln say this with a smile, as her two sons and my two brothers rushed tumultuously through the room, talking loudly of some plan they had for amusement.

And no less smiling and gracious was the great man half of us called 'pa,' and the rest of us (as we were taught at home) 'Mist' Pres'dent,' with no thought of its high import—this gentle, smiling father who played with us and told us stories when those whom Tad called 'plaguey old generals' gave him a little leisure.

When the President came into the family sitting room and sat down to read the newspaper, the boys would rush at him and demand a story. Tad perched precariously on the back of the big chair, Willie Lincoln on one knee, Bud Taft on the other, both leaning against him; Holly Taft on one arm of the chair—and I would find myself swept into the group by the long arm which seemed to reach almost across the room. I dimly remember the story—usually, I think, about hunters and frontiersmen chased by Indians—and I remember how he drawled impressively, 'They galloped and they galloped'—

'But they got away, pa, they got away,' interrupted Tad.

'Oh, yes, they got away.' Then suddenly rising to his full height, 'Now I must get away.'

'And we will get away,' shouted the boys as they scattered with jumps and laughter. I think of this when I see St. Gaudens' statue, and my memory supplies the four little wriggling figures, all gone now.

In a former story in the *Atlantic Monthly* I told how it came about that my brothers and I were familiar visitors at the White House. At their first meeting Mrs. Lincoln had asked my mother to send her two boys to play with the Lincoln boys, about the same age. A close friendship resulted, and for nearly two years my brothers, Horatio Nelson Taft, Jr., known as 'Bud,' and Halsey Cook Taft, 'Holly,' were the only playmates of William—'Willie'—and Thomas—'Tad'—Lincoln. I was kept pretty strict in the French school I attended, and I liked the good times the boys had, so I 'went along.'

Mrs. Lincoln was very kind to me always. She said she wished she had a little girl like me. I was in my early teens but small for my age and slender, with long curls, and usually wore a much beruffled white frock, and looked several years younger than I really was. I spent many happy hours with Mrs. Lincoln, she talking freely with me and I chattering as a young girl will.

As I was sitting by her one day with my lap full of silk pieces, out of which I was trying to make something for the Sanitary Commission Fair, President Lincoln came in.

I tried to rise and keep the pieces on my lap.

Mrs. Lincoln said, 'You needn't jump up every time Mr. Lincoln comes in the room.'

We were strictly enjoined at home to rise when the President entered. He would say, 'Sit down, Julie'—he always called me 'Julie.' As time went on, however, I think Mrs. Lincoln grew more tolerant of these little observances.

She often said when I left her, 'Go down to the conservatory and tell the bouquet man to make you a nice bouquet to take to your mother.' This functionary would take a perfect rose, hibiscus, or cape jasmine for the center, and then, as his assistant tied the short-stemmed flowers onto broom straws, he built up the bouquet to the shape and size of a cabbage, finishing the edge with maidenhair fern or forget-me-nots. It was then put in a stiff paper 'bouquet holder.'

One day I had a very fine one which Mrs. Lincoln suggested I might take to Governor Sprague.

When the Rhode Island regiments were, on arrival, barracked in the Patent Office, my father, Judge H. N. Taft, chief examiner of the Department of Steam, gave up his large pleasant room to Governor Sprague and his staff, only reserving one corner for his desk and his assistant. So I had become very good friends with the 'little governor.'

As I approached the door, proudly bearing the beautiful bouquet, Miss Kate Chase sailed down the hall, escorted by two officers. She asked, 'Where are you taking that bouquet, child?' I answered, 'Mrs. Lincoln gave it to me to take to Governor Sprague.' She took it from me, saying, 'I will give it to the Governor with Mrs. Lincoln's compliments.' I went back to Mrs. Lincoln with wrath and tears, but she comforted me, saying, 'Never mind, Julia, you shall have a finer one to take to the Governor when Miss Chase isn't around.'

The winter of 1861 was a wild and stormy time in the Capitol. I often attended the sessions of Congress with my mother. On one occasion, sitting

Suddenly the great doors of the House were thrown open and the sergeant at arms appeared bearing the mace before him, and as he proceeded slowly up the aisle toward the speaker's desk, those angry, turbulent Congressmen slunk into their seats and there was a great calm. That rather thick baton with the silver eagle on the top and silver bands about the Roman fasces is the visible token and symbol of the authority of the speaker, and back of him the power of the Government of the United States of America. If it is necessary to arrest a member of the House, the sergeant at arms taps him on the shoulder with the mace. There is no question or appeal from that touch.

All that spring, after the Congressmen and office-seekers fled northward, and before the soldiers came, Washington lay desolate, tracks torn up, wires down, the fear of a mob of the Baltimore 'Plug Uglies,' with the residents and negroes cowering under the great 'War Comet,' which was blazing in the sky. We shared the sorrow of the border people with interests on both sides, friends and relatives in both the gathering armies. Yet the 'good times' among the boys went on.

Tad ate up all the strawberries which were being forced in a special house, usually kept locked. Willie brought the news. His mother said,

'Now what made you do that, Tad? Major Watt hoped to have them for the state dinner.'

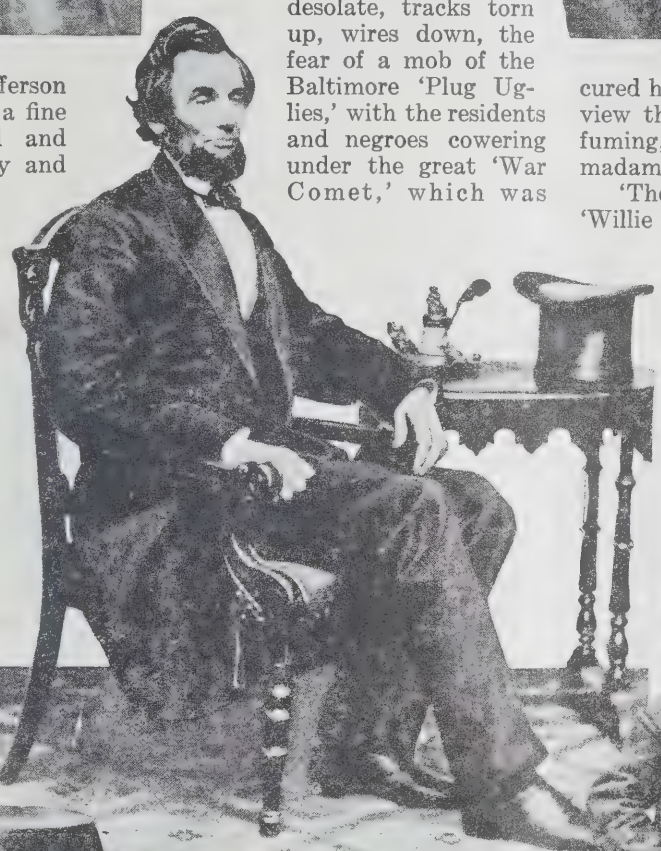
'Major' Watt was the head gardener. Mrs. Lincoln procured him a commission. I went out to view the despoiled plants. Watt was fuming, threatening to go to the madam.

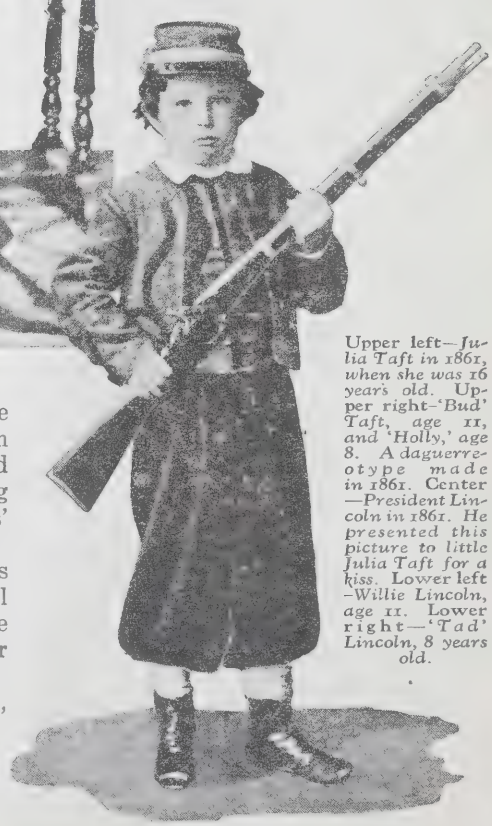
'The madam knows it,' I said. 'Willie told her'; and as he seemed in a great rage I added, 'He is the madam's son, remember.'

'The madam's wild cat,' snarled the head gardener.

Nearly every Sunday morning Willie and Tad appeared, to go to church with us. Once as we went into church (*Continued on page 26*)

in the Senate gallery, we heard Jefferson Davis' farewell speech. He was a fine orator, and as he stood, tall and straight, his words falling slowly and solemnly, he said, 'I shall never stand in this place again.' At another time, in the gallery of the House of Representatives, we listened to an 'animated debate' on the right of secession. Half the members were on their feet shaking their fists and yelling invectives at each other, while the speaker pounded on the desk with his gavel in a vain attempt to restore order.





Upper left—Julia Taft in 1861, when she was 16 years old. Upper right—'Bud' Taft, age 11, and 'Holly,' age 8. A daguerreotype made in 1861. Center—President Lincoln in 1861. He presented this picture to little Julia Taft for a kiss. Lower left—Willie Lincoln, age 11. Lower right—'Tad' Lincoln, 8 years old.

The Great Anneke Jans Delusion

Most Remarkable Lawsuit in American History

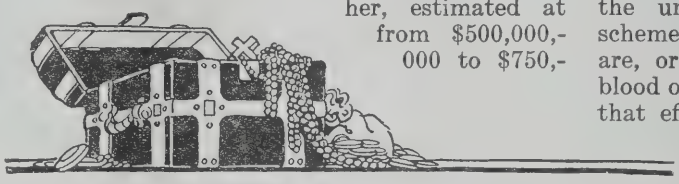
By CHARLES ALBERT COLLMAN

A DECEPTION as illusory as the historic South Sea Bubble, and quite as ancient in point of years, has once more leaped into the spotlight. Through cities, towns and villages in the Middle West, there is creeping a rumor of untold millions that are awaiting the heirs of a resident of old New Amsterdam in the latter half of the 17th Century, when the present city of New York was a province of Holland. Indeed, the properties in question, now represented by the real-estate holdings of Trinity Church Corporation, are estimated to aggregate a value of more than one billion dollars, and bring in an annual income of some $1,250,000—for Old Trinity, which celebrated its 225th anniversary in 1922, is the most heavily endowed church corporation in the United States.

With this splendid prize as its goal, it appears that a body was organized in Toronto, Canada, about four years ago, with the cumbersome title of the 'Anneke-Webber-Jans-Bogardus and Edwards Heirs Association, Inc.' It has its president, vice-president, treasurer and secretary, and regular meetings are said to be held on the second Saturday in each month in a hall in Toronto. Emissaries from this association are now active in Ohio and adjacent states organizing meetings of alleged heirs of Anneke Jans Bogardus, and offering them an opportunity to join the Canadian society on payment of a $25 membership fee and an assessment of one dollar a month.

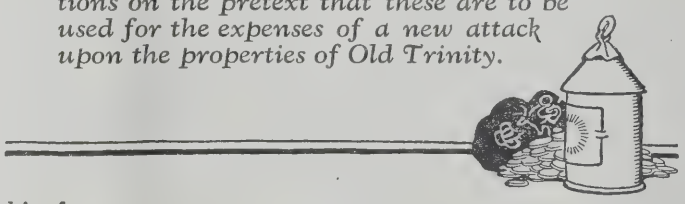
Under the stimulus of these great promises, hundreds of persons are digging up their ancestral records, poring over family Bibles, and, inspired by assurances that they have a legitimate claim to the great inheritance, which has been piling up its assets for the last few hundred years, are sending their fees and assessments to the Toronto organization.

The Canadian association is no new thing. For many years such groups have been organized in various parts of the country, from Portland, Maine, to San Francisco. Indeed, in the city on the Golden Gate it was announced not so long ago that the heirs of Anneke Jans, living there, would soon be in receipt of a portion of the vast fortune left by her, estimated at from $500,000,000 to $750,000,000, of which $80,000,000 was actual cash held by the Bank of Holland; that the heirs expected an adjudication any day of a suit brought against the Trinity Corporation. It was exactly the same promise that was being made by the Canadian organization which recently predicted that all the heirs 'were going to be made happy before Christmas.'



THE fact that in this, the first quarter of the 20th Century, there are persons who can be persuaded to give credence to the ancient Anneke Jans claim, shows that some inherent quality dwells in this delusion—based probably on the longing latent in every human breast to gather in the fabled pot of gold at the foot of the rainbow. But the claim on the part of persons calling themselves descendants of Anneke Jans, to lands in the possession of Trinity Church, has been so often defeated by judicial decisions, as far back as the year 1749, that it has been conclusively established as a myth.

Yet the Anneke Jans fable persists, like the tale of Captain Kidd's treasure trove, and it is constantly kept alive by suggestions that new grounds have been discovered for making good the claims of the heirs. The delusion excites the hopes of the credulous and makes them part with their many contributions on the pretext that these are to be used for the expenses of a new attack upon the properties of Old Trinity.



Six years ago the offices of the district attorney of New York were deluged with inquiries relating to publicity literature of the Anneke Jans scheme, which had been broadcast from New York through the medium of alleged newspaper clippings. The police became active in trying to round up a gang that was apparently operating from New York City, the members of which had taken at least one million dollars from their dupes.

The authorities of Trinity Church have done what they could to dispel this perennial delusion and to protect the unsuspicious against mercenary schemers; but the men and women who are, or who imagine they are, of the blood of Anneke Jans, are so numerous, that efforts to warn them have been only partly successful.

In 1923, a Los Angeles newspaper published an article bearing the headlines, 'Los Angeles Heirs Battle for $850,000,000 New York Estate—Descendants of Old Gotham Family Claim Church Holds Property Illegally.' The story went on to relate that a portion of the world's greatest estate, the Peter Wyckoff-Anneke Jans properties, lying in the heart of New York City's financial district, and estimated in value at the aforesaid $850,000,000, might go to Los Angeles if some 250 descendants of the original owners of the lands succeeded in establishing their claims.

The celebrated Anneke Jans, whose name is being perpetuated in this curious manner, was the widow of Dominie Everardus Bogardus, the first preacher sent to the new colony of New Amsterdam by the Dutch West India Company. She died in Albany in 1663, Governor Stuyvesant having in 1652 confirmed to her a 62-acre tract left by her first husband, Roeloff Jansen. In the will of Anneke Jans, she institutes her children as her universal heirs, all her property, including the farm lying on the North or Hudson River, to be divided among them in equal shares.

This 62-acre farm, which afterward was to become the center of great dispute, was known as the 'Dominie's Bowery.' Above the original settlement of New Amsterdam, there were six farms or 'bouweries' laid out on the island, the one nearest to the fort on the Hudson River side, called the 'Company's bouwerie,' being reserved for the use of

the director general. The farm to the north of this, which had been deeded to Roeloff Jansen and his spouse, lay about the base of an elevation called Kolch Hoek or Chalk Hook. It was mostly marshland and practically uncleared. The will of Anneke Jans is written in Dutch and is dated January 29, 1663. So far as can be ascertained, it was never administered; no executors were appointed and no inventory of record has ever been found.

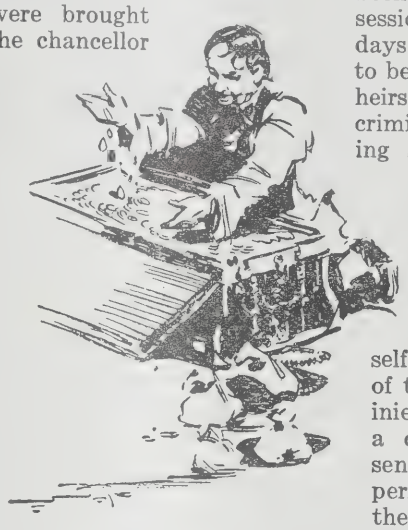
THE British laid claim to all the territory of the New Netherlands in 1664; the colony was seized, but the British governor is said to have confirmed to the heirs of Anneke Jans Bogardus the 62-acre tract of land. This was Governor Nicoll. He obtained his recall, and Colonel Francis Lovelace was appointed his successor. All the heirs of Anneke Jans Bogardus, with the exception of Cornelius Bogardus, the second son of Anneke Jans Bogardus by her second husband, at this time sold their land to Colonel Lovelace. It is held that the title was not absolute nor clear, since all the heirs were not represented in the instrument. It has also been maintained that the transfer of the property to Colonel Lovelace was made under duress, and that subsequent titles and grants were defective.

In 1672, Britain and France proclaimed war against Holland, and a Dutch fleet thereupon seized the opportunity of retaking possession of New Amsterdam. Later came a formal treaty of peace between Holland and Britain, and the territory of New Netherlands was ceded back to England. Lovelace, during whose administration New Amsterdam had been surrendered to the Dutch, was reprimanded by the Crown. The Duke of York confiscated his properties in America, alleging that Lovelace was heavily in debt to him. The Bogardus farm thus passed under the control of the Duke of York, and later became the possession of Queen Anne.

IN August, 1693, the Colonial Assembly provided for the building of a church in New York City, and Trinity Church was completed and dedicated for worship in February, 1697. Land upon which the church was built was acquired from the Corporation of the City of New York; later the land immediately surrounding the edifice was obtained for a cemetery. Then a land grant was made by Queen Anne, in 1705, that the church might have a permanent source of income and upkeep; in this wise the Trinity Corporation came into possession of the old farm of Anneke Jans Bogardus.

The first litigation with regard to the old Dominie's Bowery began in 1749, when Cornelius Brower, an heir, commenced an ejectment suit for the recovery of that part of the Jans-Bogardus lands leased to Adam Vandenberg by Trinity Church; the action resulted in a judgment in favor of the defendants. In 1757 Brower initiated another ejectment suit, which also resulted in his defeat.

A Colonel Malcolm, claiming heirship from Anneke Jans Bogardus, commenced a similar suit in 1800; it resulted, in 1807, in a verdict for the church. The ball had been set rolling in the round of long-continued litigation; other cases were brought into the courts; but the chancellor ruled that remedy to the complainants was barred by lapse of time before the filing of the bills.



Nevertheless, a suit in Chancery was begun in 1830 by one John Bogardus, in which William Berrian was made defendant, as rector of the church, and William Johnson as the controller. The complainant died, but the suit was reviewed on a bill of revivor on behalf of his heirs. The hearing continued for thirteen days and a large number of witnesses were examined in open court. The Vice-Chancellor then rendered a decision in favor of the defendants, due to the expiration of the 20-year law of limitations; the bill was dismissed with costs. Several other actions were begun, notably one by Christopher C. Kierstead, in 1851, which led to no definite conclusion.

IN 1896, John H. Fonda, of New York City, incorporated an association entitled 'The Union Association of Heirs of Harlem, Anneke Jans Bogardus, Edwards & Webber Estates.' Several years later, Mary A. Fonda, as one of the Bogardus heirs, began an action against the Trinity Corporation in the interest of the Union Association, to recover possession of one hundredth part of the property at No. 65 Vandam Street.

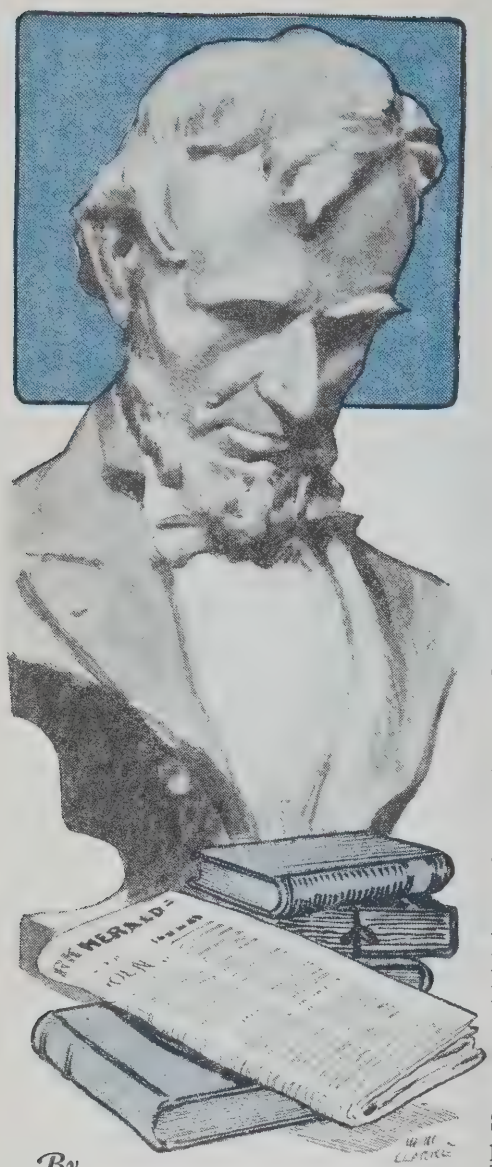
Attorneys for Trinity filed an answer, and referred therein to the Charter of 1697 and the Queen Anne Grant of 1705; they added that 160 years thereafter, the Trinity Corporation by deed conveyed the Vandam Street property to Benjamin Cooper; the mortgage being afterward foreclosed, the property again reverted to Trinity. The Supreme Court judge granted the application of the Trinity Corporation for an order directing the plaintiff to file a reply to the defense's answer, which set up the Queen Anne Grant. The plaintiff failed to file a reply, and early in 1913 warrants were issued for the arrest of Fonda and a Mr. Good, upon the grounds that they had been using the mails to defraud.

Fonda, who was then eighty-six years old, related in court the details of the twenty years' fight of the Anneke Jans heirs to recover the lands which they claimed as their rightful possession. Judge Hand, in the United States Court, in which the case was being tried, said that he would dismiss the fraud indictment against Fonda, it being evident to him that the old man had been prompted by an obsession from his childhood days, of enormous wealth to be gathered by the Jans heirs, and not by any criminal motives in seeking subscriptions for the prosecution of the claims. Good also was acquitted.

A New York attorney, with offices on Broadway, then took it upon himself to champion the cause of the heirs to the Dominie's Bowery. He caused a circular letter to be sent to a large number of persons, representing to them that they were legitimate heirs to the rich landed property in lower Manhattan Island, and as such, they had claims of immense value against the Trinity Church Corporation; he solicited money from them for the alleged purpose of financing an investigation of their claims. It was charged against him that he had persuaded one man to invest the sum of $25,000 in the chimerical project.

Among his contentions was one that the church had obtained its grant through false representations to Queen Anne; another that the transfer from the children or heirs to Colonel Lovelace was not even signed; a third that the letters patent of the grant were not properly signed. The plaintiff was tried in the Appellate Division of the Supreme Court, and disbarred from the practice of the law. Since his disbarment, no claimants to the Anneke Jans estate have been able to get their actions into the courts of the state of New York, although two or three efforts were made to do so in 1923.

CONSIDERING the parlous experiences of litigants in recent years, it is very doubtful whether the Canadian society will ever make an attempt to bring the subject of the Anneke Jans claims to the attention of the New York courts. So it may not be amiss to caution those who actually are, or who imagine they are, descendants of Anneke Jans Bogardus, that they had better not throw away their money in membership fees and assessments to any association organized for the furtherance of a time-worn and fantastic scheme.



The Most Traced Character *in* American History

Little Lost Speeches *and* Anecdotes *of* Lincoln

By CARL SANDBURG

Illustrated by W. W. CLARKE

ABRAHAM LINCOLN'S foot-tracks, relics, vestiges, have been tracked, traced and trailed more closely, more accurately, and more completely, than those of any other character in American history. The healthy curiosity with which men have sought out every scrap of paper he wrote, records of his casual utterances, off-hand remarks, his looks and ways, has no parallel in the annals of this country. And while there have been historical characters in America and Europe, and in present and past times, who have been more intimately recorded by their own writings and by the writings of a few others who wrote close up, there does not come to mind any other personality and personage in history who has undergone scrutiny and withstood reminiscence on the part of so many close observers across so long a period of time as in the case of Lincoln.

In the collection of Oliver R. Barrett, the indefatigable collector of Lincoln manuscripts and of essential material bearing on the Lincoln legend and tradition, I was shown a file of the New York *Herald* for the years 1860 and 1861, and there became acquainted with a correspondent who was sympathetic to Lincoln, and whose long letters to New York often had neat, swift, true little sketches of Lincoln.

Among other disclosures in this old file of the New York *Herald* are two speeches of Lincoln's, not included in the editions of collected addresses. Inasmuch as it seems they have not been printed since the week of their delivery sixty-six years ago, they are almost in the category of 'lost speeches.' The telegraphic dispatch containing these two speeches is dated Chicago, November 21, 1860, and in its opening paragraph refers to a Democratic sheriff placing four ironed convicts, one a murderer, in seats between the Lincoln family and the family of Lyman Trumbull, the Republican Senator from Illinois, on the railroad passenger car in which the party of the President-elect left Springfield. The dispatch reads as follows:

THE LINCOLN REGIME
WHAT IS DOING IN SPRINGFIELD
JOURNEY OF THE PRESIDENT ELECT AND FOUR CONVICTS TO CHICAGO
MR. LINCOLN'S SPEECHES ON THE ROUTE
HIS RECEPTION AT CHICAGO

Chicago, November 21, 1860.

Mr. Lincoln, the President elect, left Springfield for this city at eleven o'clock this forenoon, accompanied by Mrs. Lincoln, Senator Trumbull and family, and Don Piatt and wife, of Ohio. Mr. Lincoln purchased his ticket and traveled in a crowded and inconvenient car, like other democratic sovereigns, neither the company nor conductor showing him any courtesy whatever, although the same corporation recently titled a foreign Prince on a special train over their road with all the honors. The conductor permitted four ironed convicts, one a murderer, to enter the car and take seats between the families of Mr Lincoln and Senator Trumbull. The Sheriff having the culprits in charge is a Douglas democrat.

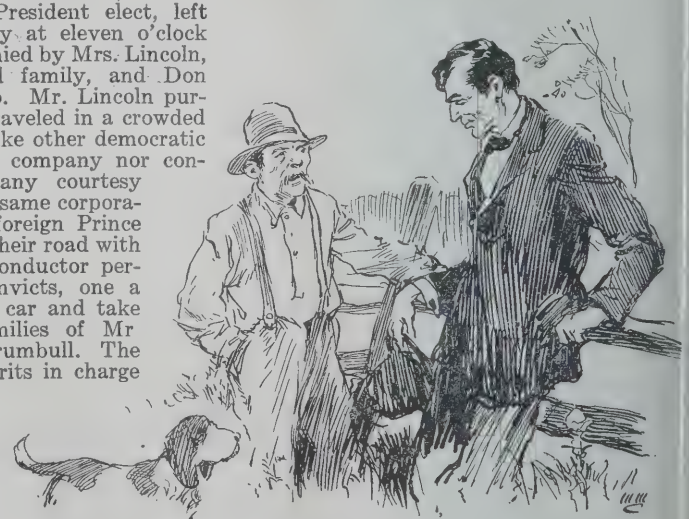
A large concourse of citizens were present at the depot in Springfield to witness the departure of Mr. Lincoln. He heard many a 'God bless you,' and 'Safe return.'

Although the visit of Mr. Lincoln to this city was not generally known in this State, yet crowds of people assembled at every depot, and congratulatory demonstrations of some kind were made at the town of Lincoln. Several hundred ladies and gentlemen assembled at the depot and shouted for Lincoln until he appeared, when some enthusiastic 'Sucker' introduced him as the President of the United States. The crowd cheered vociferously, when Mr. Lincoln said:

'Fellow Citizens—I thank you for this mark of kindness towards me. I have been shut up in Springfield for the last few months, and therefore have been unable to greet you, as I was formerly in the habit of doing. I am passing on my way to Chicago, and am happy in doing so to be able to meet so many of my friends in Logan County, and if to do no more to exchange with you the compliments of the season and to thank you for the many kindnesses you have manifested towards me. I am not in the habit of making speeches now, and I would therefore ask to be excused from entering upon any discussion of the political topics of the day. I am glad to see so many happy faces, and to listen to so many pleasant expressions. Again thanking you for this honor, I will pass on my journey.'

Bowing to the enthusiastic crowd, Mr. Lincoln entered the car, which was already in motion. At Bloomington a very large crowd assembled, and after many calls, Mr. Lincoln appeared and spoke again, as follows:

'Fellow Citizens of Bloomington and McLean County—I am glad to meet you after a longer separation than has been common between you and me. I thank you for the good report you made of the election in Old McLean. The people of the country have again fixed up their affairs for a constitutional period of time. By the way, I



An acquaintance met Lincoln and began remonstrating about paying men four dollars a day for 'talking and sitting on benches.'

think very much of the people, as an old friend said he thought of woman. He said when he lost his first wife, who had been a great help to him in his business, he thought he was ruined—that he could never find another to fill her place. At length, however, he married another, who he found did quite as well as the first, and that his opinion now was that any woman would do well who was well done by. So I think of the whole people of this nation—they will ever do well if well done by. We will try to do well by them in all parts of the country, North and South, with entire confidence that all will be well with all of us.'

A federal salute was fired while the train stopped at Bloomington. After Mr. Lincoln concluded his speech, Senator Trumbull was called out, and responded briefly. Mrs. Lincoln received quite an ovation at this point, as well as her husband. She bore herself admirably, bowing gracefully to the crowd, and shaking hands with those who approached her for that purpose in the car. On the arrival of the President elect at the depot in this city he was met by a few gentlemen, who took the party in private carriages to the Tremont House, where they are quartered.

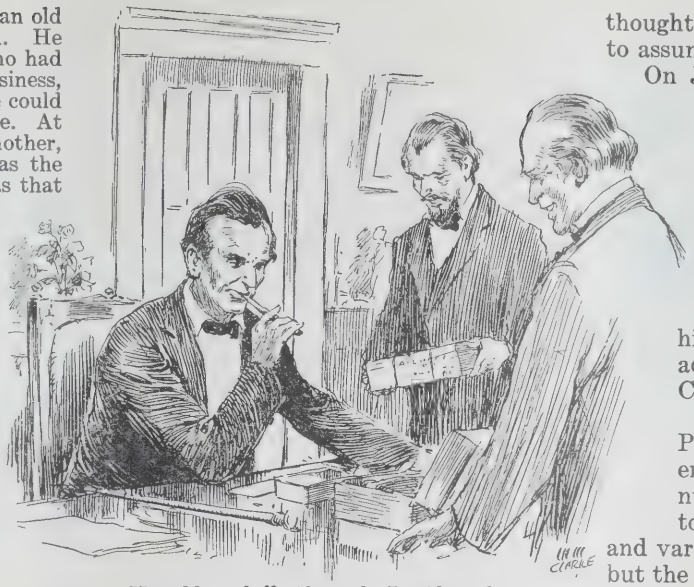
The coming of Mr. Lincoln was not known in this city except to a select few, until yesterday's *Herald* arrived here this evening, about an hour before the Presidential party. Hence there was no demonstration at the depot.

So far as it is known, the sole survivor of those who listened to the Bloomington speech is Mrs. Pammie L. Ricks of Chicago, widow of James B. Ricks, formerly a judge of the supreme court of Illinois. At the time of the speech, Mrs. Ricks, then a girl of seven years, was at the rear platform of Lincoln's train when Lincoln reached down and lifted her from her father's shoulders and kissed her.

A 'lost' anecdote of Lincoln arises from the shadowy framework of a letter dated November 29, 1860, wherein the correspondent is telling little day-by-day happenings at the Lincoln home and in the state capitol where Lincoln met friends and citizens daily. Says our correspondent:

SOME twenty-three years ago, when Lincoln was doing this state his first service, in the capacity of a member of the lower branch of the General Assembly, the legislators saw fit to raise their per diem from two to four dollars. The passage of this measure excited a good deal of feeling in those poor times. It was thought entirely uncalled for, extravagant, and an outrage upon the taxpayers of the state. Lincoln had to endure a good deal of denunciation upon that score after his return.

'One day an old acquaintance, in the shape of a blunt, hard-working yeoman, met him and also commenced remonstrating about the same matter. He could and would not understand why men should be paid four dollars per day for "doing nothing but talking and sitting on benches," while he averaged only about one for the hardest kind of work. Having fully given vent to his feelings, he wound up at last with an angry, "Now, Abe, I want to know what in the world made you do it." Nothing daunted by the dissatisfaction of his constituent, "Abe" replied instanter, "I reckon the only reason was that we wanted the money." '



The oddest of all gifts to the President-elect was a whistle made out of a pig's tail.

A letter to the *Herald* dated Springfield, January 18, 1861, supplies this oddity for historians to contemplate:

'A greenish fellow arrived here day before yesterday from North Carolina, and sought and found accommodations for himself and wife at one of our hotels. Entering himself and companion on the register, he astonished the clerk by adding the word "abolitionist" to his name. Being pumped, he confessed that he supposed "they were all abolitionists where Lincoln lived, ready to lynch any Southerner," and hence thought best, while among the wolves, to assume the airs of one.'

On January 20, the correspondent gives his readers personal information as follows:

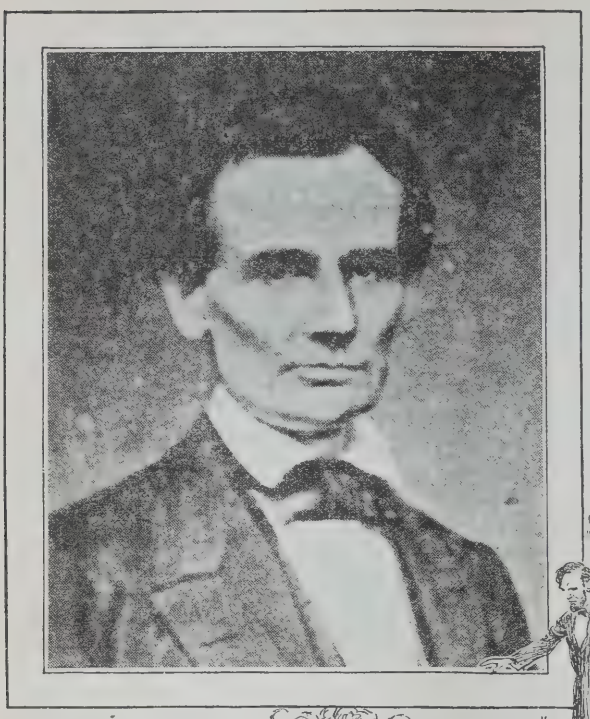
'I have just learned that about two weeks ago a scandalous painting on canvas was received by Mrs. Lincoln per express from South Carolina. It represented Mr. Lincoln with a rope around his neck, his feet chained and his body adorned with tar and feathers. Comment is unnecessary.'

On February 16, when the President-elect was in New York en route to his inauguration, a number of gifts were delivered to him. Canes, a suit of clothes, and varied items were among the gifts, but the reporter writes:

'The oddest of all gifts to the President-elect came to hand, however, in the course of yesterday morning. It was no more nor less than a whistle made out of a pig's tail. There is no "sell" in this. Your correspondent has seen the tangible refutation of the time-honored saying that no "whistle can be made out of a pig's tail" with his own eyes. The donor of the novel instrument is a prominent Ohio politician, residing at Columbus, and connected with the state government. Mr. Lincoln enjoyed the joke hugely. After practicing upon the masterpiece of human ingenuity for nearly an hour this morning, he jocosely remarked that he had never suspected, up to this time, that "there was music in such a thing as that." '

On February 20, as the train moved across New York State, the correspondent's unique pen portrait of Lincoln was published, along with what is believed to be the earliest versions in public prints of the famous 'abutments' anecdote, and the slow horse story. The news letter reads in part:

At Bloomington, a very large crowd assembled, although Mr. Lincoln's coming was known to few.



Lincoln at the time of his nomination to the presidency.

It was plain to see that the Lincolns are common-sense, home-like folks, unused to the glitter and flutter of society. Towering above all, with his face and forehead furrowed by a thousand wrinkles, his hair unkempt, his new whiskers looking as if not yet naturalized, his clothing illy arranged, Mr. Lincoln sat toward the rear of the saloon car. Putting prejudices a-one side, no one can see Mr. Lincoln without recognizing in him a man of immense power and force of character and natural talent. He seems so sincere, so conscientious, so earnest, so simple-hearted, that one cannot help liking him, and esteeming any disparagement of his abilities or desire to do right as a personal insult.

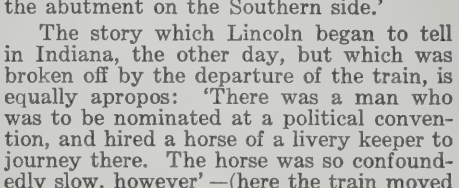
What will he do? All are asking. Mr. Lincoln says that he has not yet determined; he cannot determine until he shall get all possible light upon the subject; but he is sure that he will say nothing 'inconsistent with the Constitution'—his favorite phrase. Will he favor Weed or Greeley? Either Weed or Greeley would give a small fortune to know. Lincoln does not know himself as yet. He acts very cautiously and balances favor with favor. If he is closeted with Greeley one hour, he gives, soon, an hour to Weed. If he takes Greeley's arm, he walks upstairs by Weed's side. If he dines with Weed's governor, he sleeps at Greeley's hotel. How can Lincoln know which to choose, when to know would be to decide upon his policy, and that he keeps undecided?

With the rare argumentative and logical powers; with a great self-possession and self-control; with the intimate knowledge of politics and politicians, and with the uncommon, homespun common sense which his friends claim for him, Lincoln seems a man to act and decide for himself, and not be entrapped by either of his dear friends, who, like the fabled spider, would be glad to catch this presidential fly. He seems tremendously rough, and tremendously honest and earnest.

Lincoln talks excellently and with ease upon any topic, and tells a story with consummate tact. He seldom tells stories in his public speeches, however. When first in Congress he adopted the hifalutin' style, but has since changed this for that Spartan simplicity of manner and diction which all great orators have preferred. Of late, also, he tells fewer stories than usual in conversation. As a specimen of what his stories are—and for them he has a great popular reputation—he said, one day, 'I once knew a good, sound churchman, whom we'll call Brown, who was on a committee to erect a bridge over a very dangerous and rapid river. Architect after architect failed, and at last Brown said he had a friend named Jones who had built several bridges and could build this. "Let's have him in," said the committee. In came Jones. "Can you build this bridge, sir?" "Yes," replied Jones; "I could build a bridge to the infernal regions, if necessary." The sober committee were horrified; but when Jones retired Brown thought it but fair to defend his friend. "I know Jones so well," said he, "and he is so honest a man and so good an architect that, if he states soberly and positively that he can build a bridge to Hades—why, I believe it. But I have my doubts about the abutment on the infernal side." ' You should see Lincoln's facial contortions at this point. 'So,' Lincoln added, 'when politicians said they could harmonize the Northern and Southern wings of the democracy, why, I believed them. But I had my doubts about the abutment on the Southern side.'

The story which Lincoln began to tell in Indiana, the other day, but which was broken off by the departure of the train, is equally apropos: 'There was a man who was to be nominated at a political convention, and hired a horse of a livery keeper to journey there. The horse was so confoundedly slow, however'—(here the train moved off, amid great laughter, but Lincoln concluded the story at the next station)—'that the man arrived too late, and found his opponent nominated and the convention adjourned. When he arrived home he said to the stableman, "This is a fine animal of yours—a fine animal." "Do you think so?" "Certainly, but never sell him to an undertaker." "Undertaker! why not?" "Because if the horse were hitched to a hearse, resurrection day would come before he reached the cemetery." 'So,' concluded the President, 'if my journey goes on at this slow rate it will be resurrection day before I reach the Capitol.'

Such are the stories with which Lincoln delights his friends when in the mood, but of late the mood comes seldom.



The Lincoln Memorial at Washington.

At a reception in the Astor House i New York, Lincoln mistook a stranger face for that of one he knew, a thing tha happened rarely with Lincoln. The reporte wrote:

'Mr. Lincoln then bowed again to th several gentlemen who were then presente to him, all of whom he cordially receive He mistook one old gentleman for a perso who formerly used to call on him at Sprin field to sell illustrated copies of Shakespear but was set right by some person present

An eminent critic once declared himse in some such fashion as follows: After bein immersed in surmises, hazards, conjecture and speculations concerning an historic character, how we welcome to our hearts single concrete fact, if it be only the con vincing narrative of how he blew his nos and with which hand.

The array of contemporaneous new paper material bearing on Lincoln as a ma politician, statesman, is of sufficient exte to make an important book with man piquant pages. Such a work is under prep aration at the hands of Paul Angle Springfield, Illinois, secretary of the Lin coln Centennial Association.

The years pass and the Lincoln traditio marches and grows. Across the comin thousand years in America it will be a livin thing, a moving force in the hearts of me The documentation of this legend has gon so far and deep, is already so thorough accomplished, that it is safe to say tha Lincoln is to live as a luminous truth rath than a conventional or a controversi myth.

EDITOR'S NOTE:

Carl Sandburg, in the preface to his tw volume biography of *Abraham Lincoln, t Prairie Years*, has this to say of Oliver Barrett and his Lincoln collection:

'The Barrett collection began more tha thirty-five years ago when Oliver R. Barre as a boy of fifteen started to gather letter manuscripts, photographs, of Lincoln an reminiscences from men and women who ha met Lincoln in life. There in Pittsfiel county seat of Pike County, Illinois, th old settlers had heard Lincoln deliv speeches, had sat at turkey dinners wit him, and had passed the Gillmer hous where Lincoln, going to a conference in th house, had lifted Lizzie Gillmer off the fro gate, kissed her and put her back on th gate; they remembered the little red-heade boy, John G. Nicolay, who was a printer devil at the office of the Pike Count *Free Press*, and the boy John Hay who wer to school and wrote "contributions" for th *Free Press*. There Barrett grew up; lat he was a Peoria lawyer, familiar with th "orgmathorial" humor and savor of the o Eighth Circuit Bar and the stump politi of central Illinois; then he moved to Chicag

Keen in the scrutiny of evidence an shrewd in his analysis of documents; man droll, inventive, quizzical and lovab in the company of children; a long distan walker, a fisherman, story-teller, bookma a man who takes a ten or fifteen mile hik at midnight or dawn when the impul moves him; a man who enjoys being u grammatical when with ungrammatic people; with the restless urge of the pon express rider modulated by the peacef preoccupations of the antiquarian—Oliv R. Barrett requires further portraiture.'

Lincoln in Marble and Bronze

(*Continued from page 7*)

opular because it is usually photographed ith children grouped in Lincoln's arms, r about him on the bronze bench. It is also requently photographed with negro boys nd girls and laboring men sitting with im on the bench.

The Adolph Alexander Weinman statue f Lincoln, in bronze, which is located in he public square at Hodgensville, Lincoln's irthplace, is a massive sitting figure. incoln sits in a chair with his ight hand on the arm of the hair and his left hand on his left nee, in repose, as if buried deep n thought. This humble, insig- ificant little town reminds one f the phrase, 'Can there any ood thing come out of Naza- eth?' A most insignificant entucky village, sleepy, dull, ninteresting, with a few one- tory business buildings on a ingle public square; the only hing that lifts the horizon is he *Lincoln* bronze.

The Emancipation Group, y Thomas Ball, is in Lincoln ark, Washington, D. C., and hows Lincoln a rather con- entional figure, with his ands lifted over a kneeling lave. This is one of the older nd better known, but not orceful bronzes of Lincoln. n Lincoln, Nebraska, is the amous French *Lincoln.* This ronze has one of the most mpressive backgrounds of ny of the memorials. It is on he capitol grounds. Directly ack of this statue is a mas- ive marble block, almost as arge as the cabin in which incoln was born, with the Gettysburg Address carved in etters two inches high.

In Springfield, Illinois, is he O'Connor *Lincoln,* which, n a way, reminds one of the Barnard bronze. It has run he latter a close race in the natter of discussion. Even oday there is a great differ- nce of opinion in Springfield ver this slender, awkward ronze. The artist intended o depict the Lincoln of the Farewell Address, how he ooked and what was in his spirit the day he eft Springfield for Washington, never to eturn alive.

The MacNeil *Lincoln,* a standing figure ith folded arms, is a different type of reatment and a most impressive one. In his bronze the Great Emancipator's tall ilk tile hat sits on a bench beside him, and is cape falls over that bench in graceful olds.

In addition to the French *Lincoln* in incoln, Nebraska, this artist has also one a sitting *Lincoln,* a figure in which oth hands are hanging rather gracefully ver the arms of the chair in which he sits. his bronze is in the Lincoln Memorial in Vashington, D. C., and is coming to be one f the most popular of all the Lincoln bronzes. The setting is most beautiful and stately, in the center of the great open temple.

Buffalo, New York, boasts of its Charles Henry Niehaus bronze of Lincoln. It is a figure sitting in a chair with the long legs crossed. This is the only treatment of Lincoln that calls attention to the legs. One is reminded of Lincoln's story in which he was asked how long a man's legs ought to be, and he replied, 'Long enough to reach the ground.'

Other beautiful bronzes of Lincoln include: that by Leonard W. Volk and the Lott Flannery *Lincoln,* which is set on a tall marble column pedestal in front of the Court House, in Washington, and was unveiled April 16, 1868, only a few years after Lincoln's death.

Perhaps the first inspiration to immortalize Lincoln in bronze and marble came from a colored woman, Charlotte Scott, of Marietta, Ohio. She gave the first five dollars the morning following the assassination of Lincoln. The five dollars, along with $17,000 more, all raised by popular subscription, were used to erect *The Emancipation Group,* previously mentioned. It was unveiled April 14, 1876. It was not the first to be erected, but it was, most assuredly, the first to be planned. And it was curiously appropriate that a colored woman should have the first thought of thus memorializing the man who set her race free, and that she should conceive the idea the day following his death.

Muskegon, Michigan, boasts of a sitting statue of Lincoln. It too was done by Charles Niehaus who did the Buffalo, New York, *Lincoln.*

The Randolph Rogers statue was erected in Fairmont Park, Philadelphia, on November 26, 1869. It shows Lincoln in a sitting position with his right hand raised as if speaking. It is erected on a pyramidal pedestal, about fifteen feet high. The figure of Lincoln by Vinnie Ream in the rotunda of the Capitol at Washington is a figure in a draped gown holding a manuscript, the only draped *Lincoln* the writer knows. The artist has pictured him in the attitude of delivering a stately academic address.

Burlington, Wisconsin, boasts of its *Lincoln* done by George E. Ganiere, and unveiled October 13, 1913. It is a beautiful figure, with the hands behind, crossed, as some poet has said of Napoleon,

'As if to balance that prone brow
Oppressive with its mind.'

It is a curious thing that every one of these many sculptors of Lincoln have achieved an original posture. No two of them are alike. Some are sitting, some standing, some with legs crossed, one draped, one with the hands behind, some in the posture of public address, some in the posture of private and intimate conversation, some in repose.

At Edinburgh, Scotland, on the Calton Hill, is the statue done by George E. Bissell. It is a bronze figure and rests on a massive granite pedestal. The figure at the base is that of a free negro holding up a wreath to Lincoln. On the face of the pedestal are the words of Lincoln: 'To preserve the jewel of Liberty in the framework of Freedom.'

This statue is a memorial to Lincoln, as well as a memorial to the Scottish soldiers of the American Civil War.

The three great memorials in marble to Lincoln are the beautiful Greek Temple which houses the humble log cabin in which Lincoln was born; the beautiful memorial in Washington, and the Lincoln tomb at Springfield, Illinois. Hundreds of thousands of people visit these sacred spots every year.

Ye Men of Power

Mrs. C. H. Wright

YE MEN of power
Lift your eyes from the gutter
And vision the stars.
Measure yourself by each other
And gaze upon Mars.
Like motes in the dust ray
A moment you stay and are gone.
Forget not the mote is invisible dust
In the ray of the sun.

Noise the Destroyer

(Continued from page 2)

that I had begun to enjoy evaporates. The few minutes of reflection which I had looked forward to, no longer exist. I am stunned and confounded by the din about me.

I get on a train. I travel with an interesting companion. We make an effort to converse. We shout to make ourselves heard above the shrieking of the axles and thumping of the rails. Presently the effort surpasses our ability to concentrate. Our remarks become trite and mediocre. The conversation compared with the same discourse in a quiet study is a failure.

I dine in a high-priced restaurant. The orchestra begins to play. The cello causes cold shivers to run up my back. The harmony of twenty violins, at first pleasing, makes it necessary for me to yell at the waiter. My friend and I brace ourselves against the noise. There is clatter of china and silverware. Chatter of voices. Noise—noise everywhere! Consider the day on which I am preparing this article. I should be fresh as a flower. I went to bed early last evening at an expensive hotel and in a room fitted with all the luxuries and comforts money could buy. There was even a little pasteboard sign for me to hang on the door, which read: 'Do not disturb.' 'Fine!' thought I to myself. 'Now I can get well rested for my lecture tomorrow.' As the room was chilly, I turned on the radiator. Instantly, a deafening series of reports issued therefrom. I was so startled that I glanced around involuntarily to see who had opened fire at me with a machine gun. Then I chuckled. It was, of course, just a little water in the iron radiator coils which caused a 'water-hammer.'

I took a shower in a beautifully appointed bathroom. When I turned off the hot water for a final cold spray I could have sworn that an ocean liner was blowing its whistle right outside the window. But it was only some kind of hydrostatic vibration in the water pipes that was causing the rumpus.

My room was many stories above the street. Yet I could hear the honking of taxi horns, the pounding of surface cars and the shrill whistle of porters far into the night.

I was awakened at early dawn by the raucous rattle of my telephone bell. Who could be calling at this hour? The bell dinned three times, long-drawn-out, nerve-racking jingles, before I finally roused sufficiently to answer it. When I could not understand the message and at last managed to convey my name to the operator, I was soothed by the following: 'Excuse it, please. Wrong number!'

This reads as if it were a libel on the hotel which lodged me. But I assure you it was one of the best in the world; also one of the quietest big-city hostelries at which I have ever stayed.

Having heard so much about American quick-lunch restaurants I went to one for breakfast. As I eat very little at the start of day, I thought I should not mind if everyone else was in a hurry. But I minded a lot of things about the place before I was through with it.

I seated myself in a corner to be out of the way of what seemed to be the main traffic. But even there I had to shout to the waiter to make myself heard. As he darted away to fill my order, he collided with a brother servant who carried a large tin tray loaded down with dishes. I half rose from my seat as the tray and its burden of crockery crashed to the floor. But the echoes of the catastrophe were lost in the general uproar. How the denizens of that place could stand beginning each day of their lives in such a riotous atmosphere was more than I could see.

There is the constant clatter of voices. People hammer the eardrums of their companions.

At ten I had a business engagement with a friend. I found him with three telephones on his desk and a secretary at his side. Two nervous messengers were teetering on one side of him. On his other side was a window open to noisy traffic below. He glanced up and spied me.

'Sit down, old man,' he said genially, reaching out for my hand with one of his. His other hand reached for a telephone which had just tinkled. 'Hello? Oh, yes.' He turned to one of his stenographers, holding one hand over the telephone receiver. 'Take a letter,' he said, and began to dictate. His dictation was interspersed with a casual word now and then to me. Twice he spoke to the messengers, dismissing one and giving the other instructions. How the stenographer knew which words were meant for her I could not see. 'Oh, hello,' he said into the telephone as that part of the circus began again.

As far as I could see, my American business friend was effectively entertaining me, dictating a letter, holding a conversation over a telephone, and handling two messengers. When he was through he had other telephones in operation. But with it all my feelings were not at all hurt, because his rapid-fire comments to me were both amusing and appropriate to our meeting and to the situation.

However, when the smoke of the situation cleared away and he engaged with me on the business in hand, I noticed he was no altogether at ease. When some one bumpe noisily against his door he glanced up, h mouth open ready to speak. A telephon bell outside jangled; involuntarily h reached for one of his telephones. Tw taxicabs bumped below his window, and i a trice he was on his feet peering down int the gathering crowd to see what had gone o

'This man,' said I to myself, 'is burnin himself up with attention to unnecessar sounds and disturbances.'

On my way out I stopped at a telephon booth and put in a long-distance call. Bu my success was only mediocre. Right in th middle of my conversation some one droppe a packing case outside the door. Twice m conversation was broken into by loud nois on the line. The shriek of a fire engine sire was another noise that leaked into my s called soundproof booth. I thought, ' this is soundproof, then it would take grave to eliminate the noise of ma kind.'

I went to a musical recital after lunc The party was held at a private hous As I stepped inside I thought the must surely be a fight or some sort excitement. I have never heard such buzz and clatter of voices. They we mostly women. They chattered lik so many birds in a cage.

But when the artist took up his violi his listeners' appreciation was shown b the hush which fell over the room. He bega to play. The spell of his sweet melody w in a few moments cast upon tho about him.

Then the inevitable noise of civilizatio began to interrupt. A tramcar passed ou side. A horn tooted. A telephone ran From the depths of the house came th shout of some ill-mannered servant. traffic whistle filtered through the windo A thoughtless child turned on a radio another room. A door slammed. An an bulance went clanging by outside. Instea of listening to the violinist I found myse wondering what form the next noise wou take.

I could go on through that day and th next and the next, and they would all be th same: noise, noise, noise; noise disturbi people; noise unnerving people; noise crus ing people.

The effects of civilization on me after return from an arctic trip are brought o particularly in my nerves and digestio As I take most excellent care of myself, can attribute my troubles only to consta irritation of the sights, sounds, and smel which assail me.

I find myself irritable over small thing I find that I can eat less food proportio ately and that I have a considerably le appetite than I would normally in th Arctic.

It might be suggested that this is b cause I am taking less exercise, and becau I have more work to do. On the contrar there are long periods in a storm-bour igloo when exercise is absolutely impossibl Also during work periods there is a gre deal more work. Yet there is none of th lack of appetite nor the increasing ir tability. I sometimes (Continued on page 2

Lincoln's Friend at Court

(Continued from page 4)

his boat, when the boat is there and there is no other way.'

Was the defendant quibbling, or was this a valid legal distinction?

Squire Pate looked at Caroline; she had no doubt that the defendant had expounded good law. Squire Pate began to think so also.

He looked into his book of statutes, read the license, and said:

'I find that John T. Dill has the exclusive right to operate a ferry at this point from the Kentucky shore of the Ohio River, and to set passengers across the river in either direction; but I do not find that the defendant is forbidden to convey a passenger from the Indiana bank to the deck of a passing steamer. The case is dismissed, and the defendant is discharged.'

At least three persons present heartily approved the verdict. These were Abraham Lincoln, defendant; George Pate, of color; and Caroline Meeker, niece and ward of the magistrate.

THE Dills returned to their ferry, ruefully grumbling over their defeat. The few neighbors scattered. Abraham Lincoln lingered, and the squire invited him to sit for a little while on the porch.

'That was rather a nice point of law you raised,' said he. 'You seem to me to have a legal mind. Have you ever thought of studying law?'

Then Lincoln told him about his life. He had a very meager education, obtained under great difficulty, with little prospect of being able to use it. He was not yet of age, was helping his father, who lived sixteen miles inland, and he had little incentive to study. But he liked to read, and had an ambition to be something more than an ordinary laborer.

He told Squire Pate that he was a Kentuckian by birth, but had lived in Indiana since he was seven years old, and he was now nearly nineteen. His father's home was sixteen miles from the river, but Abraham had come to work for Green Taylor, at Troy, nearly opposite where Squire Pate lived. His work was partly in Taylor's store, and partly on the flatboat which Taylor operated as a ferry across the mouth of Anderson's Creek. Abraham was getting six dollars a month and board, and was taking most of the money to his father.

He told the squire that he had inherited from his father some liking for the water; Thomas Lincoln had constructed a flatboat and on it made his first journey from the mouth of Knob Creek to that of Anderson's Creek, and so from Kentucky to Indiana. From him also Abraham had inherited some skill in the use of tools, and he had built for himself a flat-bottomed rowboat of his own. It was this offending craft that had got him into trouble with the Dills. Indeed, as he afterward told William H. Seward, it was with this clumsy little boat he had earned his first whole dollar in a single day, conveying two men and their luggage to a passing steamer. The sums he gathered in this way were infrequent, for usually Dill was alert to his own interests; still, Abraham had earned an occasional fee in that manner, and it was the easiest money he had ever pocketed.

But this did not satisfy him. He wished he knew enough to do something else. His father had taught him to work, but not to love work. He wished he had education enough to be a clerk on a river boat, or something other than a farmer and splitter of rails.

He picked up the volume of Statutes of Kentucky, and Squire Pate suggested that if he would like to read the book, he might do so any time he cared to cross the river for that purpose. The squire could not lend it, as he needed it in his judicial business.

Abraham thanked him, and promised to return. He bade the squire good day, and walked past the little cemetery and down through the orchard toward the river.

Now it chanced that Caroline Meeker was in the orchard just at that time, gathering some apples for her uncle and for the family use. She met Abraham Lincoln, and offered him an apple.

That was the way the trouble began, a long time ago, back in the Garden of Eden. And it might almost be said that there is no prettier way for trouble of that kind to start.

'I'm glad you beat them,' she said. 'It was mighty mean of them to call you over the river in the lying way they did, and then both jump on you, two to one.'

'It was sort of double-teaming it on me,' laughed Abraham, 'but they did not duck me, and they did not fine me.'

'I think it was right clever,' said she, 'the way you showed that setting folks out from the shore on to a boat was not the same as setting them across the river.'

'It seemed to save me from a fine,' observed Abraham.

'If Uncle Sam had fined you, I would have scolded him,' said Caroline.

Oh, Caroline, with your hand in the basket, filling Abraham Lincoln's pocket with apples, and your rebellious brown curls behaving just the way they ought not, or maybe ought, and your brown eyes looking out from under your slatted sunbonnet, had I been there in Abraham Lincoln's place, I should have kissed you under that sunbonnet; I know I should! What did you mean, you naughty minx, meeting him there under the apple tree, and letting him see how pretty you were, and how much you admired him, and how little you liked the Dill boys?

After the husking had made some progress, George Pate, accompanied by Moses Thrasher, produced their musical instruments, then known as a fiddle and a banjo.

And, now that I am scolding you, why did you contrive to tell him about the corn-husking that was to occur the very next week in Eli Thrasher's big barn? Did you not know that he would offer to cross the river and escort you there? And I, even while I am scolding you, don't you know I am wishing I had been there in his stead?

No wonder Abraham Lincoln became interested in reading out of Squire Pate's big book of Statutes of Kentucky. And no wonder people said that he was not so much interested in law as he was in Caroline! I, too, studied law in my youth, and I would have crossed the Ohio River several times for the sake of reading law on Squire Pate's broad porch and drinking a glass of buttermilk as Caroline brought it sweet from the churn.

And as for the husking—I cannot say I ever enjoyed it. It is hard on the hands, and it is wearisome for the back, but I would husk till my finger tips bled for the joy of walking to the party and back with a girl with brown eyes and curly brown hair like Caroline, or another I once knew. I verily believe Eve had hair and eyes like that. They stir deep memories in me, and they stirred the rather sluggish spirit of Abraham Lincoln. On the night of the corn-husking, he was there. He had rowed across the river, hiding his boat where the Dills were not likely to discover it and play any tricks upon him, and he walked up to the front door of Squire Pate's home, and walked away with Caroline to the husking party.

The Thrashers were kin-folk of the Pates. Squire

The crowded and overgrown little cemetery.

Samuel Pate's wife's name was Arretta Thrasher. She was a sister of Eli Thrasher; that is, she was a sister of one of the long procession of Eli Thrashers; there was always an Eli Thrasher, and sometimes there were as many as three, all in a row. They crowd their corner of the little old cemetery below Squire Pate's house. But the Eli Thrasher who was a brother of Squire Pate's wife was very much alive, and would inherit a large farm, and a number of slaves, and a good family name. And he looked a little surprised and not wholly pleased when he saw Caroline Meeker enter the barn under the competent escort of Abraham Lincoln.

THE corn had been pulled from the stalks, and lay in a long, oval pile in the middle of the barn floor. Two judges, skilled and experienced and supposed to be impartial, walked several times around it, and agreed that 'the end to-*wards* the river was a leetle mite the biggest, but the other end had a heap the most nubbins in it,' and the rail was laid accordingly.

Then they chose sides, two captains selecting in alternation, both men and women joining in the husking. Caroline was soon selected, not, presumably, so much for the corn she would husk as for her popularity, and Abraham happened to be chosen on the same side, which did not offend either of them.

Then there was a drawing of lots for choice of the two ends of the pile, and the captains, after much advice from the men of their respective sides, looked the pile over, and the fortunate one chose.

At a given signal they set to work, each side determining to be first to the rail, and each admonishing the other not to hide too much unhusked corn in the husks, and each one boisterously declaring that the pile was not divided fairly, and each young man surreptitiously hunting for red ears. For the young man who found a red ear was permitted to kiss a girl, and to make his own selection. If it chanced to be a girl who found the red ear—but that is part of this very story. And besides, girls were not so bold then as they are alleged to be now.

After the husking had made some progress, George Pate, a person of color, accompanied by Moses Thrasher, a gentleman a trifle darker, produced their musical instruments, a violin, then known as a fiddle, and a banjo. Some of the time they sang, and one of the songs had to do with the time-honored denunciation of the man who laid the rail, and of dire threats for his security and peace of mind:

Hit's a mighty dry year when de crab-grass fail;
Oh, rho, rho, rho, who laid dat rail?
Hit's a mighty dark night when de nigger turn pale,
De big-foot nigger dat laid dat rail!

Chorus:

Oh, rho, rho, rho, who laid dat rail?
Show me de nigger dat laid dat rail!
I'll hit him wid de hoe and I'll hit him wid de flail—
De big-foot nigger dat laid dat rail!
Hit's a mighty pore crap when de red ear fail,
Oh, rho, rho, rho, who laid dat rail?
An' I'se gwine to get de ear an' I'se gwine to kiss de gal,
An' I'll find hit dar right under de rail!

Thus with maledictions on the man who laid the rail, and with keen search for the red ear, the husking proceeded. And if too much corn was not pushed back into the shucks, the more fast and furious the husking went, the better. And no man there husked more rapidly or threw more bushels of yellow ears into the pile than Abraham Lincoln. And he did not find one red ear the whole evening, except—

I do not want you to think Caroline bold, but what was a girl to do? She found a red ear, and she quickly hid it under her apron. She was not bold enough to display it and select a man and kiss him before that crowd. But she waited till she had opportunity to pass the ear to Abraham Lincoln, unobserved, as she hoped, and he knew a red ear when he saw it, and he did his duty. So far as I am aware, that was as well as she could have managed the matter. And it is too late to make any complaint about it now. For it would indeed be a poor crop of corn that produced no red ears: no one more fully shared that opinion than Abraham Lincoln. He had an unmusical voice, but he had a good ear for rhythm, and the song that George and Moses sang was joined in by many of the huskers, including Abraham. Perhaps you would like to know that 'rail' and 'gal' in the pronunciation of these choristers made a nearly perfect rhyme, and that they gave to the word 'ear' the present fashionable and aristocratic pronunciation, as they sang:

Hit's a mighty pore crap when de red yaw fail,
An' I'se gwine to find de yaw an' I'se gwine to kiss de gail.

Abraham Lincoln did both those things. He had help about the finding of the ear, as I have told you, and possibly some also with the remainder of the undertaking.

But, when Abraham Lincoln walked home with Caroline Meeker, and bade her goodnight on her uncle's wide porch, did h repeat the performance?

He did not.

It had been a part of the play, before but this would have been something mor serious.

Not but that he wanted to.

But what right had he to kiss thi beautiful young woman, a member of on of the most aristocratic and prosperou families along the Kentucky bank of th Ohio? What had he to offer her? He lacke two years of being of age. And when h became of age, he would be landless an penniless. And her people had their lan and their slaves and their pride. Non sense! He was a fool for thinking of such thing!

HE CONTINUED to visit Squire Pate' home, but not so frequently as he ha planned. Before very long he made hi trip down the Ohio and Mississippi t New Orleans. Then, he worked for a whil on the canal at Louisville. And in crop tim he had to assist his father, and the farm wa sixteen miles from the river.

Moreover, if you must know the whol truth, Mrs. Pate did not wholly approve Abraham Lincoln. She wante Caroline to marry her brothe Eli Thrasher. Then Carolin would have a good home, wit land and servants, and a gooc prosperous, steady husban To be sure, Eli was eigh years older than Caroline, bu what of that? Why should man of twenty-five be though too old to marry a nice girl seventeen, going on eighteen Arretta Thrasher Pate did n like to see Abraham Lincol coming to study law on h husband's porch, and Carolin taking him buttermilk fres from the churn. Why shoul he be studying law? And if h had to study it, why shoul he come there to study it? F Caroline ought to marry E Thrasher, and not be bothere by landless young men fro the backwoods of Indiana.

That was the way Mrs. Pate felt about i

Abraham Lincoln quickly felt this o position to his coming, and was ready t assent to the justice of it. He had no righ he said to himself, to thrust his attentio on this lovely girl. And he did not.

After his return from New Orleans h was not at the river for any long period and he saw less and less of the lovely gi with the brown eyes and the curly brow hair. In the spring of 1830, when he w barely twenty-one, he removed with h father and stepmother to Illinois, and h never saw her again.

But she did not forget him. She hear that he had served as a captain in a Indian war, and she was sure he was th bravest of them all. And after a while sh heard from people who visited the Illino country that Abraham Lincoln was member of the legislature. She often wo dered if he would not come back some da and she put off her near-at-hand lover, E Thrasher, till Abraham Lincoln had bee home more than three years. Then sh married Eli Thrasher, just as every one ha always expected that she would.

Now, please do not ask me whether th

THE WHITE HOUSE *by* GERALD VAN DER HEYDEN

; all true that I am telling you, or whether am making it up. And yet, if you must now, I will tell you. I am not making it up; may be adding a touch of color here and iere to fill in the scant and faint outline of radition, but my part in the creation is a ery modest one. Why, I cannot even end as I want to do. Don't you know that if were making it up, there would be a appy ending? And that is just im-ossible.

Come, then, to where I learned this radition, and we will finish the story with ie most solemn and indisputable docu-ientary facts. We will go to the solid old g house of Squire Pate on the Kentucky iore of the Ohio, and push our way through ie tangle to where Caroline gave Abraham ie apple, and we will find the crowded and vergrown little cemetery, and get some of ie living Pates and Thrashers to help us lentify the names we do not know.

HERE is John Beauchamp, his grave iarked by a stone of unusual size, and he ad no relation to this group of families. Ie was a passenger on a river steamer, and as taken off, desperately ill of pneumonia, own there at the landing where Abraham incoln used to tie up his boat. John eauchamp died in his twenty-ninth year, ied in the hospitable home of Squire ate, died a stranger, but not friendless, nd they buried him here with their own in. That was the kind of hospitality Squire ate believed in.

And I have told you about George ate, colored, who refused to be set free, nd was buried here with the family after ie war had closed, with an upward point-ig hand to tell that the Pate family be-eved he had to gone to heaven just like hite folk. And the long line of Eli hrashers; and Samuel Pate, Esq., and his ife, Arretta Thrasher Pate. They are all iere.

But what about Caroline, wife of Eli hrasher?

She is there, too. She died December 5, 1835, aged twenty-five years, five months id fourteen days, which makes her a year id a half younger than Abraham Lincoln. nd her husband did not live many years. .e died June 6, 1842, aged thirty-nine ears, six months and twenty-six days. He ever recovered from the tragic death of aroline. The memory of that sorrowful hristmas shadowed him till he lay down eside his wife, whom he had loved for any years and possessed for less ian two.

THERE is one other stone we must read. aroline, daughter of Eli and Caroline hrasher, did not live to repeat her mother's mance, but died June 2, 1851; and when e set down the fifteen years, five months id nine days that were reckoned as be-nging to her earthly life, we know how er mother died. Little Caroline was born i Christmas Eve, and her mother died ext day.

I wonder if Abraham Lincoln ever knew out this. I wonder if, in the winter llowing the death of Ann Rutledge, some ie who had come from near his old home in diana brought word that Squire Pate's ece, the one who married Eli Thrasher, ed giving birth to her first child.

But I do not know. I have told you all know about it, and a very little besides. it not very much.

Noise the Destroyer

(*Continued from page 20*)

wonder if noise isn't wrecking humanity. We all become numb to it. After three months I cease to notice noises any more than anyone else. But I realize that the noises are still having their effect on me; and that at the end of a long day my fatigue has come as much from the constant din about me as from any other single factor.

I think the drawn faces and high-strung nerves of the average American are due to noise more than to the high speed at which he lives. Cowboys and Indian hunters and forest rangers often live at high speed. But their nerves are never so taut as those of the same type of man submitted daily to the uproar of the city.

Noise must play its share in bringing about divorce, disease, and other evils of modern civilization. It must have its effect on small children, on mothers and on elderly people.

What can we do about it? What did we do about the flickering of motion pictures, or the failures of gas engines, or the static in radio? We put our best minds on the problem and in each case eliminated the defect.

Nobody seems to be giving any real attention to eliminating noise today. A scientific study of the problem might lead to a very considerable elimination after a year or so, or sooner.

We might put into the hands of our policemen some power for reducing noise on streets. We certainly should have city ordinances all over the world regulating the amount of noise any citizen can make.

You Americans are removing smoke from the air overhead. It is my prediction that in ten years you will remove the noise from the air about your ears.

Think what it would mean to have a radio concert on every corner, strains of sweet music instead of the din of traffic!

. . .

There, see how the disease has gripped me. I cry out against noise, demand its removal, and then suggest another form!

The Visitor *From* Paris

THE visitor who had been to Paris said that the way to make a stay in Paris (or in Europe) expensive is to go to places marked 'American,' or 'English spoken here.' An American newspaper agency will purchase your theater tickets for you and will tell you that the charge is about 10 per cent. However, actual investigation shows that a thirty-six-franc ticket is sold for forty-five francs, making a 25 per cent charge. If you are wealthy, or if your stay is extremely limited, you may do well to use these American agencies, but the visitor from Paris noted that you pay a fee ranging from 25 per cent to 33⅓ per cent on prices used to keep up the American offices in Paris. Further, it is always desirable to do such things in person, as you learn the ways of the country and see more of the real Paris and the real Europe than you do from the top of a sight-seeing auto-bus.

$5000 to $10,000 a Year for Life

ENTER this business and big money starts right away and it lasts a lifetime! Payne averaged over $20 a day the first 200 days. Trantum, just starting, made $167 in one week. Hickey made $148 in a single day! This pays big money full time or part time. Are We Scrapping the Whole Navy?

(Continued from page 5)

Take the first comparison, for instance, the ratio of 5-4-3 in battleships left by the treaty. We are supposed to be on a parity with Great Britain, but actually we are not, for thirteen of our eighteen battleships are deficient in gun ranges and four of the eighteen are only twelve-inch gun ships, the only twelve-inch gun ships in the three navies. Of this class of battleship, H. C. Bywater, the leading naval author of England, said *before* the conference: 'Since the twelve-inch gun is no longer considered equal to the tactical requirements of the future, *capital ships armed with this weapon have ceased to be reckoned as first-class fighting units.*'

Then again, the six classes of ships listed are not all of equal value in a fighting fleet, battleships being the most valuable, then cruisers, and so forth, and so objection might be raised to adding them all together to obtain a fleet value. Notwithstanding this, the results are considered fairly accurate for the reason that the table takes into consideration the condition of the vessels listed, their seaworthiness, their reliability, the condition of their machinery and, what is very important, the crews that operate them, something no purely mathematical formula has ever done.

What the conference did was to deprive us of our big battleships and restrict their future building, insure our weakness in the other types by refusing to agree to their limitation, and to put no limit on future construction except to set the standard for cruisers at 10,000 tons and eight-inch guns. The significance of this will be apparent when we see that England's advantage in cruisers and destroyer leaders was far greater than ours in battleships, for she possessed more than forty of a comparatively recent type of cruiser compared to ten we had only started to build and eighteen destroyer leaders, a class of vessel our Navy did not have. Japan had on the way sixteen cruisers, sixty-two destroyers, and eighty-four submarines. These ships were all completed.

The totals for ships built and building since the conference are:

The United States, sixteen ships; Great Britain, thirty-seven ships; Japan, 101 ships. According to data on file in the Navy Department, the modern light cruiser standing is as follows:

	United States (*tons*)	*Great Britain* (*tons*)	*Japan* (*tons*)
Built and Building	12– 95,000	51–304,290	25–156,205
Authorized	6– 60,000	12–106,000	4– 40,000
Total	18–155,000	63–410,000	29–196,205

Those who have contended that the world needed only the good example of the United States and disarmament would follow, have their answer in the events of the past few years. Despite the superiority given in auxiliary tonnage by the treaty, Japan and England have gone on just the same with warship construction.

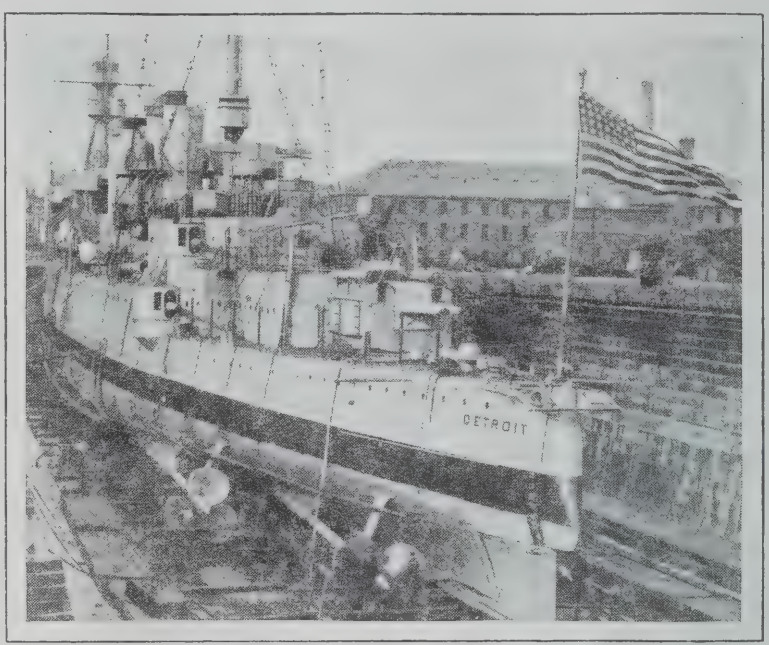
It is very obvious that instead of making good the discrepancy in standing, the United States has been steadily growing weaker. As far as the treaty is concerned, both England and Japan have observed it just as faithfully as we have. It failed to limit auxiliary tonnage, and that failure has been taken advantage of. The peace inoculation did not take. In the light of the facts presented, that is, in view of their great superiority in auxiliary craft and their inaugurating wholly unnecessary building programs, England and Japan cannot be said to have caught the spirit of the conference. In that endeavor, at least, the meeting seems to have been bitterly disappointing, a good point to remember should another conference ever be called. Another conference *must* be called if the armament race is to be effectively stopped. Europe is slowly drifting back into her old ways. France is building sixty-five vessels for her navy and has authorized twenty-four more. Italy is now working on forty-seven vessels of war in addition to laying the foundation of a splendid merchant marine. With these facts before us, the conclusion is inevitable that the movement begun at Washington in 1922 has not made much headway.

The forward progress of the two foreign navies we have discussed has been matched to a certain extent by our decline. First of all we have retrogressed by not keeping pace with the powers mentioned in the addition to the navy of vessels not forbidden by the treaty. As we have demonstrated, our poor position in this respect has thus become worse. Secondly, under the guise of economy we have allowed what we have to deteriorate to such an extent that well-informed officers expressed the opinion in December, 1926, before the House Naval Committee, that in all-round strength the United States Navy was not even equal to the Japanese.

In a report sent to the House of Representatives and submitted by Representative Britten in May, 1924, Secretary Wilbur admitted there was not a single submarine in the whole Navy that could accompany the fleet. Two of the first three built for that purpose have since proved a failure. Three T-class boats designed for the same duty and commissioned in 1921 have been put out of service as unsatisfactory. Nineteen boats of the H, K, and N class had to be laid up to furnish men for the S boats. Four of the I class were offered for sale thirteen of the O and P class are what the Navy Department called in the report 'not so good,' and scarcely half of the S class have given anything like satisfaction. The secretary further admitted that in comparison with that of Japan, the submarine power of the United States had a paper rating of 7.6 to 7.2. He also listed other facts to show that the Navy was being neglected. Either the latest modern practice is not incorporated, or the latest equipment, or the latest type of ships is not provided in the following list:

(A) Gun range of thirteen battleships
(B) Deck protection of six battleships
(C) Under-water protection of thirteen battleships,
(D) Kind of fuel on six battleships,
(E) No mine-laying or cruiser type of submarines,
(F) Cruisers: shortage in numbers,
(G) Destroyer leaders, none,
(I) Material readiness of ships out of commission especially destroyers and submarines,
(J) Auxiliary ships: speed and radius limited in certain auxiliary ships converted from the merchant marine.

Of these nine items none have been completely eliminated as yet and only three have received any attention, namely, (B) Deck protection of six battleships; (C) Under-water protection of only six battleships; (D) Kind of fuel on six battleships. In his annual report just sent to the President, Secretary Wilbur again calls attention to serious deficiencies. He says: 'On account of the expenses which would be required for the complete upkeep of the fleet, it has been necessary to apply available funds to repairs and to limit alterations to be undertaken on any ship to those for which specia



—*Herbert Photo.*

U. S. S. 'Detroit,' a modern and speedy cruiser, in drydock. It is being thoroughly overhauled—the repair work including installation of four new propellers.

allotments were made by the bureau concerned . . . The general result has been that the material condition of the ships in and out of commission as a whole has been improved *somewhat*.

'Many alterations of military value have been held in abeyance, however.' Summing up, Mr. Wilbur says: 'The material readiness of the vessels of the fleet is principally controlled by age, and dependence on funds available for upkeep. With limited funds it has been necessary to concentrate on necessary repairs rather than on alterations required to keep the vessels up to the development essential to military efficiency.' In other words, the department has not been able to keep the Navy in shape because of funds barely enough to maintain it afloat.

In 1924 Congress provided a modest little construction program of eight scout cruisers, on which the work was to be spread over a period of three years: three for the first, two for the second, and three for the third. It also sanctioned, after the loss of the *Shenandoah*, two new dirigibles, as the *Los Angeles* could be used only for peace pursuits according to a previous agreement with the Allied Powers. The President signed these bills. The occasion of the outbreak in the House against the ruler of the White House was the lopping off by General Lord, Director of the Budget, with presidential approval, of the appropriation needed for three of these cruisers and the dirigible, and the knifing of the funds necessary to carry on the five-year aviation program. Money for the dirigible and cruisers was stricken out of the naval appropriation and the amount for naval aviation was cut from sixteen million to four million.

By the same hands the personnel or man power of the Navy was again reduced. This will make it necessary to withdraw from service one battleship, one light cruiser and six destroyers, in addition to the three battleships already laid up for alterations. *Progressively we are scrapping the whole Navy.* If the country is satisfied, then what England, Japan or France does need not worry us and we might as well go the limit and keep just enough of a sea force for police purposes. If it is not, then it is time to act. With a $500,000,000 surplus in the Treasury it can hardly be urged that the few millions the Navy needs this year are more than the country can bear. A penny-wise, pound-foolish policy cannot be called economy, and there is much evidence of that in the budget.

THE House Naval Committee has lodged a formal protest at the White House. Either maintain a Navy that will defend us and win us a victory in time of war, or reduce the Navy to a mere police force. What happened to the German Navy is example enough of a navy that *is not good enough* for the task assigned it. It is true, it prevented actual invasion of the home-land by the sea route, but it is also true that its inability to close the sea to the enemy did as much as anything else to lose the war for Germany.

America wants further reduction in competitive armaments; Europe is cold to our wishes. The House Naval Committee believes Europe will harken more quickly to the swish of the big stick than to honeyed words, and at this writing is considering another monster building program providing for twenty-two cruisers and other auxiliary vessels. Such a program would eventually bring us to the same superior position we held in battleships before the conference. Europe could not find money to pay us when it came to the question of settling the debts, yet has plenty of money to spend on armaments. It is time for a showdown. Words are of little value in the diplomacy of the old school, except to conceal your real meaning. Military power is the trump card they all respect. That idea worked in 1921-1922; why not try it again, since other means have proved ineffectual?

The Opening of the Civil War

(*Continued from page 8*)

Charleston, April 12, 1861.

The following is the telegraphic correspondence between the War Department at Montgomery and General Beauregard immediately preceding the hostilities. The correspondence grew out of the formal notification by the Washington Government, which is disclosed in General Beauregard's first dispatches:

General Beauregard to the Secretary of War.

Charleston, April 8, 1861.

L. P. Walker, Secretary of War:

An authorized messenger from President Lincoln just informed Governor Pickens and myself that provisions will be sent to Fort Sumter peaceably, or otherwise by force.

P. G. T. BEAUREGARD.

The Secretary of War to General Beauregard.

Montgomery, April 10, 1861.

Gen. P. G. T. Beauregard, Charleston:

If you have no doubt of the authorized character of the agent who communicated to you the intention of the Washington government to supply Fort Sumter by force, you will at once demand its evacuation; and if this is refused, proceed in such manner as you may determine to reduce it. Answer.

L. P. WALKER, Secretary of War.

General Beauregard to the Secretary of War.

Charleston, April 10, 1861.

L. P. Walker, Secretary of War:

The demand will be made tomorrow at twelve o'clock.

P. G. T. BEAUREGARD.

The Secretary of War to General Beauregard.

Montgomery, April 10, 1861.

General Beauregard, Charleston:

Unless there are especial reasons connected with your own condition, it is considered proper that you should make the demand at an early hour.

L. P. WALKER, Secretary of War.

General Beauregard to the Secretary of War.

Charleston, April 10, 1861.

L. P. Walker, Secretary of War, Montgomery:

The reasons are special for twelve o'clock.

P. G. T. BEAUREGARD.

General Beauregard to the Secretary of War.

Charleston, April 11, 1861.

L. P. Walker, Secretary of War:

Demand sent at two o'clock; allowed till six o'clock to answer.

P. G. T. BEAUREGARD.

The Secretary of War to General Beauregard.

Montgomery, April 11, 1861.

General Beauregard, Charleston:

Telegraph the reply of Major Anderson.

L. P. WALKER, Secretary of War.

General Beauregard to the Secretary of War.

Charleston, April 11, 1861.

To L. P. Walker, Secretary of War:

Major Anderson replies:

I have the honor to acknowledge the receipt of your communication demanding the evacuation of this fort, and to say in reply thereto that it is a demand with which I regret that my sense of honor and my obligations to my government prevent my compliance.

He adds:

Probably I will await the first shot and if you do not batter us to pieces we will be starved out in a few days.

Answer. P. G. T. BEAUREGARD.

The Secretary of War to General Beauregard.

Montgomery, April 11, 1861.

General Beauregard, Charleston:

We do not desire needlessly to bombard Fort Sumter if Major Anderson will state the time at which, as indicated by him, he will evacuate, and agree that, in the meantime, he will not use his guns against us, unless ours should be employed against Fort Sumter.

You are thus to avoid the effusion of blood. If this or its equivalent be refused, reduce the fort as your judgment decides to be the most practicable.

L. P. WALKER, Secretary of War.

General Beauregard to the Secretary of War.

Charleston, April 12, 1861.

L. P. Walker, Secretary of War:

He would not consent. I write today.

P. G. T. BEAUREGARD.

The Confederate States Congress.

Montgomery, April 12, 1861.

An extra session of the Confederate States Congress has been called for April 29.

On April 12 the General Press Dispatch for Charleston gave the following message: 'The ball has opened—war is inaugurated. The batteries of Sullivan's Island, Morris Island and other points were opened on Fort Sumter at four o'clock this morning. Fort Sumter has returned the fire . . . '

Four years almost to the day passed, and on April 9, 1865, from Appomattox Court House, Headquarters of Armies of the United States, 4:30 p. m., General Grant telegraphed to the Secretary of War:

'General Lee surrendered the Army of Northern Virginia this afternoon, upon terms proposed by myself.'

Five days later the most representative American of all our history lay dying from an assassin's bullet. But his work was finished. The Union was preserved.

Good Times in the White House

(*Continued from page 13*)

Willie said, 'I s'pose he'll pray a long time, preachers always pray so long for pa.'

Bud answered, 'You know your father is President of the *whole* United States, don't you? And if anything happened to him, the whole country would go to smash! 'Course they have to pray for him a lot.'

When my father cast his eagle eye over the pew we all had to put our heads down, so perhaps Willie found the 'long prayer' long. Our church, the Fourth Presbyterian, had old-fashioned pew doors, and Tad enjoyed drawing the bolt; locking us in, he called it. He usually sat on the floor, amusing himself with whatever he had in his pockets. A young officer with us gave him his knife, thinking he could not open it; but he did and cut his finger and I had to bind it up with my best embroidered handkerchief. I hissed, 'You shall never come to church with us again, Thomas Lincoln.' He hated the name Thomas, and I never called him by it unless I was angry.

Tad replied (to my horror, out loud), 'You just keep your eyes on Willie, sitting there good as pie.'

Then began the constant tramp, tramp of regiments through the streets, and Washington became a vast military headquarters, encircled by forts and camps. My father took the boys with him as he visited these camps, carrying with him a basket of oranges, apples or large white onions, which were very acceptable.

THE sixteenth of July was the grand advance 'On to Richmond,' and all day, to the music of many bands, the regiments marched through the streets and over the long bridge into Virginia. There were German regiments, not the Kaiser's goose-steppers, but of the Great Frederick's traditions, and they sang not *Deutschland ueber alles*, but the lively *Ach, du lieber Augustin*, and after they had passed came rolling back Luther's grand hymn, *Ein' feste Burg*.

There was the 69th New York Regiment of Irish-born, who bore the green flag of Erin, with the Stars and Stripes, and the 79th New York, the Highlanders with their kilts and bagpipes; then the 55th New York, the French regiment, and as they swung along they sang that song not loved by czars and emperors, for when its wild minors whip the air thrones fall and kingdoms pass away:

Aux armes, citoyens!
Formez vos bataillons!
Marchons, marchons! qu'un sang impur
Abreuve nos sillons!

Other regiments chanted 'John Brown's body lies a'mold'ring in the grave.'

So they passed, elate, triumphant, flags flying, the guns wreathed in flowers. They came back, most of them, the morning after that Sunday when Washington listened to the guns of Bull Run. Willie and Tad were at our house when we returned from church, Holly and our littlest brother, Willie, clutching their pennies and shocked that 'they dismissed the Sunday school without taking up the collection.'

Willie Lincoln, much excited, said, 'Pa says there is a battle in Virginia; that's big cannon going off that sounds like slamming doors.'

It was a disorganized mob that entered the city next day in the drizzling rain. Many of the New York boys knew where Judge Taft lived and remembered his visits to their camps, and they came to our house, 448 L Street, till it was filled, overflowing to the piazza and the pave. My father was at his office, my mother had gone somewhere with Miss Dorothea Dix, and we children were alone with the servants. Larney, our parlor maid, said, 'I allers done spec Yankee sogers got horns, but dese yere ain't got nary horn'; yet she took refuge in the coat closet under the stairs and howled for the Lord to save us.

I heard that Mrs. Lincoln had two brothers in the Confederate Army, but she never spoke of them, though we wept together over her little son, Edward, who was between Robert and Willie, and who died in infancy. Once I spoke of a boy friend who had joined the Confederate Army. 'Yes, dear,' said she. 'It is sad when our friends are in the rebel army.'

We went to the White House quite early one morning because the President was to review some soldiers from the front portico. We were upstairs when Tad snatched my cherished new parasol and ran down the hall. I flew after him and as we whisked past the door of Mr. Lincoln's room I had a glimpse of him sitting with his coat and shoes off, reading a book. The rather old, worn Bible which always lay on a small table was gone, and I thought, 'He is reading the Bible.'

Once as I passed through the room where he was sitting I went up to say good morning. He placed his large hand on my head and whirled it about, making my curls stand out in all directions; then he laughed, smoothed them down (of course the wrong way), and dropped a kiss on the top of my head.

RESTING his hand, inclosing mine tightly, on his knee, he seemed to fall into a deep reverie, looking far away. I followed his gaze but could see nothing but the tops of some trees through the window. He sat perfectly motionless and I stood by him, it seemed to me for an hour, but I presume only some minutes. I wanted to go, but felt it would 'not be polite' to pull away if I could. Suddenly he gave a little shake and said, 'Why, Julie, have I been holding you here all this while?' released me, and off I ran.

I wandered around looking for the boys, and finally found them in the East Room. Tad had a new ball which he was throwing up and catching. He finally broke a large mirror, not in the East Room, if I rightly remember, but in the vestibule, where the Marine Band used to play at receptions. We looked on with horror. Tad kicked a piece of the mirror on the floor.

'Well, it's broke,' he said. 'I don't b'lieve pa'll care.'

'It is not pa's looking glass,' Willie said. 'It belonged to the United States Government.'

Tad seemed rather impressed, especial as Holly added, 'Aunt Kitty says if y break a glass, you'll have bad luck for fi years 'less you throw salt over your le shoulder and say the Lord's prayer bac ward.' Tad darted out and returned with handful of salt, with which he besprinkl the velvet carpet over his left shoulder.

'How do you begin? Amen first, s'pose, n'ever n'ever,' but before he pr ceeded further with his difficult task, wo came from the stables that Nanko h escaped. Nanko was a goat that had be given the boys a few days before and th were training him to draw a small wago Immediately the whole ménage was inte to catch the goat and it was finally corrall in a flower bed.

IT does not seem fair to tell so ma stories about Tad and none about the oth boys. Holly was a close second to Ta but Willie and Bud were usually quiet a well-behaved. But I remember one c casion when Mrs. Lincoln had forbidd them to go over the river to a review, as was cold and windy and they all had col and the President departed without the Just after the presidential cortège pass down the line, there came clattering aft a cart drawn by a big, old, scraggly mu driven by a small, ragged, grinning darke and Willie and Bud with Tad and Holly it with some old condemned infantry swor which General McClellan had given the held at salute. Willie said he and Bud hir the darkey with their 'circus mone They had made quite a sum with a 'circ in the White House attic some time befo

About the limit in 'letting the childr have a good time' was Mrs. Lincol allowing them to attend a 'state dinne They sat near the foot of the table. M mother was properly shocked when Wil and Bud told her next day. The boys h stayed at the White House the night bef because it rained. Mrs. Lincoln alwa kept them and sent my mother word, wh it stormed.

'Why, Bud,' said mother, 'did you ev have fresh blouses?'

'Oh, yes,' answered Bud. 'You know y sent us a lot when we stayed with Wil and Tad the week their ma was in N York, and we put them in the drawer a now they are all mixed up and we do know which is which.'

'I've got on Bud's,' said Willie proud 'I know 'cause it's got tucks on the si I told ma when she took them out of t drawer, but she said, never mind, it fitt me better than it did Bud and mine fitt him better.'

I asked about the state dinner. 'I t you,' boasted Tad, 'those 'bassadors w all tied up with gold cords; they glitter grand.'

Willie added, 'Pa looked pretty pl with his black suit, but ma was dress up, you bet.'

Willie gave me a little watch cha someone had given him. He said, 'I w give you my little gold dog, Julie, becau I love you, and you must keep it alway

Dear Willie! He was pure gold if t little dog was not. But I have always kept

New Salem of Abraham Lincoln

How *the* Future President Clerked *in a* Store *and* Whipped a Bully

By J. T. FARIS

A TALL, awkward young man lived, during the winter of 1830 and 1831, near Decatur, Illinois. After a spell as a farm worker and a rail splitter, he was employed to accompany two other men with a flatboat from Beardstown to New Orleans. He was under contract to meet his employer, Daniel Offut, at Springfield, in early spring. But the spring rains were heavy, and travel by land was therefore impossible. So the young man rowed down the Sangamon River to Springfield. There Offut told him that he had not yet secured a flatboat, and hired him, with his companion, to build the needed craft.

The work was done at Sangamontown, a little community that disappeared long ago. And the most dependable of the boat builders was the young man, Abraham Lincoln.

After four weeks of steady work the boat was ready, and the long voyage was begun—on April 1, 1831. The journey was just begun when the mill dam at New Salem interposed objections to progress. On this the boat stuck for nearly twenty-four hours. During this time the entire village turned out, and jeered and encouraged by turns the men who were trying to get the boat off. Young Lincoln was not disturbed. With perfect unconsciousness of his would-be tormentors on the bank, he worked out an ingenious plan, and succeeded in getting the boat over the dam.

Offut, who watched the performance, was so taken with Lincoln that, when the voyage was over, he asked him to become his clerk in a store and mill at New Salem, which he proposed to open. The period of employment began in July, 1831.

Ida Tarbell has described vividly the little community in which the future President found himself:

'New Salem, founded in 1829 by James Rutledge and John Cameron, and a dozen years later a deserted village, is rescued from oblivion only by the fact that Abraham Lincoln was once one of its inhabitants. The town never contained more than fifteen houses, all of them built of logs, but it had an energetic population of perhaps one hundred persons, among whom was a blacksmith, a tinner, a hatter, a schoolmaster, and a preacher. New Salem boasted a gristmill, a sawmill, two stores, and a tavern, but the day of hope was short. In 1837 it began to decline, and by 1840 Petersburg, two miles down the river, had absorbed the business and population. Salem hill is now only a green cow pasture.'

Offut's store at New Salem soon became a popular loafing place, largely because the clerk, Lincoln, had such a wonderful fund of stories, which he was always ready to tell. When it was discovered that he was as good a fighter as a story-teller, enthusiasm for him was unbounded. He won his spurs when he was victor in a contest, not of his own seeking, with the chief bully of the notorious gang from Clary's Grove, a settlement nearby. The victory was won in spite of the bully's attempt to 'foul,' and Lincoln's ability won plaudits of foes and friends.

The Lincoln Museum at New Salem. Next to it is Rutledge Tavern, one of the buildings which, after lying desolate three-quarters of a century, was rebuilt to appear as when Lincoln knew it.

One of Lincoln's biographers has told how he used his prowess for decency and order. Sometimes he found visitors to the store who annoyed women and children. When they refused to behave when told to do so, the mighty clerk thrashed them well, and so enforced the law. Once he asked a man to stop swearing in the presence of women. When the man persisted, and later abused him, Lincoln said, 'Well, if you must be whipped, I suppose I might as well whip you now as any other time.' The victory over the foul-mouthed man was as complete as over the bully.

The stay in Offut's store was notable also for the famous stories illustrating Lincoln's honesty and integrity, as well as for the records of his studious habits. He studied grammar, and he studied public speaking. The village schoolmaster aided him whenever possible, and the cooper made him free of his shop at night. By the light of a fire of shavings many books were read.

The people were interested in him and his progress, and they were most sympathetic when, in 1832, he announced that he would be a candidate for the general assembly.

The chief event of the campaign was the visit to the Sangamon of the Steamer *Talisman*, from Cincinnati, which ascended the river from Beardstown to Springfield. Lincoln himself was the pilot of the boat, which was thought to be the forerunner of a line of boats that would bring prosperity to all the towns—and many towns to be laid out—along the river.

But in spite of proof of the contention of the candidate that the river was navigable, the clerk from Offut's store was defeated, although his own district voted for him almost solidly. This was the only time he was ever defeated by the direct vote of the people, he afterward proudly said.

The campaign whose issue was so unsatisfactory to Lincoln was interrupted by the call of the governor of Illinois for troops to go out on the trail of Black Hawk, the Indian chief, who had repudiated a treaty giving the lands of his tribe to the government. He had taken the warpath, was terrorizing the people of Northern Illinois, and was threatening further devastation. Lincoln volunteered for service, and, while the company of which he was a member was trailing to the Illinois River, he was chosen captain.

Lincoln and his men had no part in the conflict, though they marched to the northern part of the state.

A term as postmaster and a season as surveyor helped to vary the experiences of the ambitious young man. And it was testified of him that whatever he did, he did well. His records were kept properly, and his lines did not have to be run over.

The next attempt for the legislature was successful, and in 1834 Lincoln went from New Salem to Candalia. By this time he was not so much interested in the navigation of the Sangamon as in measures to provide canals for the state. His service was creditable, but not spectacular.

In 1835, when Lincoln returned to New Salem, he resumed his duties as postmaster and deputy surveyor. He also resolved to study law with greater energy.

A second term in the assembly, the completion of his law studies, his admission to the bar, were events of the later residence in New Salem. And at length, in 1836, he moved to Springfield, where the capital of Illinois had been moved from Candalia, and began the practice of law.

Students of history have sought out the site of the little town where he kept store, and at length have succeeded in setting apart the site as a state park.

CHATS WITH OFFICE CALLERS

'Canada,' said ***the Man from the Northwest,*** 'has one of the most remarkable educational institutions in the world—the Frontier College. It has between 20,000 and 25,000 students; yet it has no buildings, no campus, and, of course, no stadium. It is twenty-five years old, non-demoninational, and is supported by grants from some of the provincial governments. ("States" in Canada are called "provinces," you know.) The classes are held at night in box cars, in barns, in shanties, in lumber-camp shacks; and during the quarter-century of the Frontier College's existence, they have been held in more than eleven hundred different localities. The students are mainly foreigners—Slavs, Italians, Scandinavians, French, Orientals—people who can speak little or no English. Often it is necessary for the instructors first to win their confidence before they can help them along the path to a little learning, for they are by nature suspicious and distrustful.

'And the instructors themselves deserve the highest praise. There are some threescore of them. Most are graduates of Canadian universities. Others have degrees from American institutions, some from English, and a few are still enrolled in college, and take on the work between terms. The pay is nominal, and the work itself extremely difficult. They go into the mines and the logging camps under the most trying conditions, but their enthusiasm seems to remain undaunted. English is taught, and the three R's, and talks are given on forestry, politics, economics and allied subjects. The courses are, of course, largely elementary, but the foundation for solid citizenship is laid among the students.'

❦ ❦ ❦

A Paris Correspondent has this to say about 'The Professorial Manifesto':

The professorial manifesto, while emanating from a group of economists and publicists, does not read like an economic document. The arguments resemble those that were used in favor of paying tribute to the Moroccan pirates a hundred years ago. The justice of the proposed Berenger-Mellon settlement with France does not depend upon whether it is amiably received by the French or not.

If the French can by making faces and making protests reduce the billions owing to America to a pittance of payment, the French campaign will be in their own eyes justified.

The time may come when it will seem advantageous for America to remit not only the war debt but a portion of the post-Armistice debt as well. Possibly at that time the debtor nations may return to some appreciation of the fact that American assistance was not a negligible factor in the war. But bluffs and threats of French displeasure and sneers at American participation in the war should be received with the contempt which this attitude deserves.

No other nation has ever contributed so much financially to a war as the United States did to the Great War. No other nation would consider further gifts of the magnitude of those requested of America.

In all of the discussions in Europe there is no mention of the tremendous sums spent by the United States in prosecuting the war, nor of the colonies grabbed by others in terminating the war. Only the tremendous profits made by America in munitions and supplies are mentioned. Here every cent received by American manufacturers and producers is regarded as clear profit. The absurdity of such computations is beyond words. Nor is the naïve assumption that American prosperity is due to war profits worthy of discussion. American prosperity is based upon sound economic principles relating to American commerce and industry. In the past American prosperity has not depended upon Europe, nor will it in the future.

❦ ❦ ❦

'Solly Joel is worried,' remarked ***the Englishman*** as the discussion turned to precious stones. 'So are Sir Ernest Oppenheimer and Sir Abe Bailey, and others potent in the affairs of the great De Beers Mining Syndicate, which until recently dictated not only the price but the output of the world's diamonds. For too many diamonds are being produced. Adventurous diggers with no other capital than a spade are actually putting more carats on the market, from newly discovered alluvial deposits, than the great central mines. Diamonds will soon be as common as artificial pearls if something isn't done. And so the three gentlemen have arrived in South Africa from England to see that something *is* done. "Something *must* be done to alter the present situation," says Mr. Joel. "The alluvial diggers actually are producing more than the great producers. If this continues a collapse of the industry is sure to come."

'No pity need be wasted, however, on the poor diamond magnates, for there is little doubt that something will be done, and done quickly. They have a way of getting matters like this attended to, and in this instance they want the government to limit the output of the alluvial deposits by law. But it is interesting to conjecture just what would happen if the government didn't "do something." Suppose the price of diamonds were *not* bolstered by the devious devices known to Mr. Joel and his associates. Suppose diamonds really did become plentiful. How great a calamity would that be? The present value of the diamond is an artificial value; it is due not to its usefulness but to its controlled rarity. But the diamond has an actual as well an an artificial value. Even with its present exorbitant price it is being put to many uses in industry. With the output plentiful and the price fractioned it could be utilized in countless other ways. Like gold the diamond might acquire *real* value if its price became low enough.'

❦ ❦ ❦

'A great Indian convention was on in a western city,' explained ***the Western Visitor.*** 'It was the second day, and the great auditorium was crowded. Red men representing many tribes sat, grav eyed, listening to the men who spoke fro the platform. There were some who picturesque attire was so colorful they mig have passed for imitation movie Indian while others, perfectly tailored, might ha been mistaken for soda dispensers on the vacations. All the speakers had mention the city's hospitality in a laudatory fashio had dwelt at length on the beauty of t city and the kindness of its residents.

'Then, almost without warning, a r man climbed to the platform and began denounce the congress and everythi connected with it. I wish I might descri the fire which glowed in his eyes, t eloquence which came from his lips. I wi I might tell of his lack of self-consciousnes of his meaningful gestures. But I can For minutes—I don't know how many that Indian held his brothers spellboun He said they should be ashamed of ther selves: not of their progenitors or the dress or their congenital dignity, but of t fact that—he charged—they were allowi themselves to be paraded for profit. H declared that the average white man woman cared nothing for the Indian, exce as an advertising feature, and he added th the city's business men were merely e ploiting him. It was his opinion that t convention had been promoted only to dra crowds.

'It was interesting to observe the r action of his listeners. Chiefs from far-o states leaned forward in their seats, whi others nodded their approval. Apparent it never had occurred to them that possib what their brother had said might be tru Certainly hundreds of Indians were great impressed; what the outcome will be, cannot predict. In all probability, howeve that city will, next year, again invite r men from various parts of the Unit States to attend the congress. Whether will again be a success or whether th eloquent Indian accomplished his purpos I am unable to predict.'

❦ ❦ ❦

'If you have ever wondered, either id or as a matter of interest, why a h moves its head back and forth when walks,' said ***the Scientific Farme*** 'your concern has been based on a fal premise, for the fowl does not move i head backward. It only moves it forwa and then walks until the head gets l behind and has to be brought up again wi a jerk.

'It has been supposed for a long time those whose thought has adverted to t idiosyncrasies of the hen that the he motion is for balancing purposes. But th theory has been disproved by close analy which reveals that the head moves forwa only, remaining fixed with respect to t ground at points when it appears to b backward. According to authority, a us ful scientific principle enters into this, f in the fixed position the eyes are focused the surrounding territory in search of food a most natural inclination. Other domes fowls make use of the same principle, well as a number of other birds.'

CAN YOU TELL ME?

QUESTION: What is chiefly used in the manufacture of paste for luminous watches and clocks? Can you quote me the market price per ounce?

ANSWER: Zinc sulphide treated with radium bromide is chiefly used. It costs about $100 a pound.

QUESTION: How much is spent per capita annually in the United States for the following items: Tobacco in all forms, chewing gum, theaters, motion picture shows and dancing?

ANSWER: Cigars, cigarets, tobacco, snuff, cigar and cigaret holders $16.241
Theaters, movies, other amusements, dues, etc. 8.213
Chewing gum 0.765
As far as is known, no data has been prepared for the other item mentioned.

QUESTION: Is it lawful for any civil service employes or postmasters to take any part in a political campaign, such as talking for or against any candidate, entertain or help any candidate?

ANSWER: Civil Service rule 1, section 1, is as follows: 'No person in the executive civil service shall use his official authority or influence for the purpose of interfering with an election or affecting the results thereof. Persons who by the provisions of these rules are in the competitive classified service, while retaining the right to vote as they please and to express privately their opinions on all political subjects, shall take no active part in political management or in political campaigns.'

QUESTION: What state is the coldest when reckoned on a basis of the average actual temperature of the whole state?

ANSWER: The Weather Bureau advises that North Dakota has the lowest average temperature.

QUESTION: Is it true that the average age of criminals entering the penitentiaries of the United States is getting lower? What is the average age now compared with twenty years ago?

ANSWER: The census figures show that for the United States for the first six months of 1923, 51.6 per cent of those committed were between 18 and 34 years of age, and the prison population on January 1, 1923, indicated 64.7 per cent to be in that group. Comparing the percentage distribution of commitments by age for 1910 and 1923, we find an increase of 3.7 per cent in the group under 34 years of age.

QUESTION: How many turrets has the U. S. S. *Pennsylvania* and what size?

ANSWER: The U. S. S. *Pennsylvania* has four 14-inch gun turrets. Three guns in a turret.

QUESTION: What were the names of the Confederate prisons of the Civil War, their location, number of prisoners and their death figures during the war?

ANSWER: Confederate prison statistics are not complete, accurate records not having been kept of the deaths and their causes. Union soldiers captured during the war numbered about 211,411; of these 16,668 were paroled on the field and 30,218 died while in captivity. The prisoners were confined in Richmond, Belle Island (in the James River), Savannah, Charleston, Florence (S. C.), Salisbury (N. C.), Millen (Ga.), and other places. Conditions at the prison camp at Andersonville (Ga.) were probably the most deplorable, 10,000 federal prisoners dying there between February and October, 1864, or about one-third of the number confined in this prison during this period.

QUESTION: Was the Monroe Doctrine ever passed on by either upper or lower house in Congress and do foreign nations recognize it?

ANSWER: The Monroe Doctrine was first given formal announcement by President Monroe in his message to Congress in 1823. It is not a part of the statutory law of the land though its policy has been generally accepted and its principles have been given repeated recognition during the past half-century in our foreign policy. The Monroe Doctrine was effective for the purpose for which it was enunciated. It prevented the Holy Alliance from giving aid to Spain in the attempt to recover her revolted colonies. It also answered Russia's pretensions in the Northwest. The principles of the doctrine were employed in 1866 to compel France to withdraw from Mexico and in 1895 President Cleveland, invoking the doctrine by name, forced Great Britain to submit to arbitration a boundary dispute she had with Venezuela. An important result of the Venezuela incident was the official adoption of the Monroe Doctrine by Congress in its indorsement of the executive policy. At the outbreak of the World War Count von Bernstorff felt it necessary to assure the Department of State that should Germany come out victorious she would not seek expansion in South America.

In this department we shall do our best to answer questions concerning Government and kindred matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

QUESTION: What percentage of the world's gold is held in the United States of America?

ANSWER: Approximately 50 per cent of the total gold monetary stock of the world.

QUESTION: How does British foreign trade for last year compare with the year 1913?

ANSWER:

1913	General Imports:	£768,734,739
	General Exports:	£634,820,326
1925	General Imports:	£1,320,715,190
	General Exports:	£927,418,501

The difference between the value of visible commodities exported in 1926 and the value of goods bought from other countries is £465,000,000 or more than $2,000,000,000.

QUESTION: What happened to the Czar Nicholas and his family?

ANSWER: The Czar Nicholas II and his family were murdered during the night of July 16 to July 17, 1918, in the Ipatieff House in Ekaterinburg. Their bodies were carried out of the city and burned in the forest near the village of Koptiaki.

QUESTION: When and where were the last national nominating conventions of the two large parties held? Who were the nominees?

ANSWER: The Republican National Convention met at Cleveland June 13, 1924. Calvin Coolidge was nominated for President, Charles Dawes for Vice-President. Frank O. Lowden was nominated for Vice-President, but he refused the nomination.

The Democratic National Convention met at Madison Square Garden, New York City, on June 24, 1924, but did not conclude its work until July 10, 1924. John W. Davis was nominated for president and Charles W. Bryan for Vice-President.

QUESTION: What is the Rock of Gibraltar composed of?

ANSWER: The promontory or Rock of Gibraltar is composed of gray primary marble.

QUESTION: Were the *Pennsylvania* and the *Arizona* built on the same plans, and known to the fleet as sister ships?

ANSWER: Yes.

QUESTION: Was the U. S. S. *California* built and commissioned with 14-inch gun turrets and have they changed them and put 16-inch ones aboard?

ANSWER: The U. S. S. *California* was built and commissioned with 14-inch gun turrets and still has them.

QUESTION: Where can information be secured about public lands and homestead laws?

ANSWER: Write to the Commissioner of the General Land Office, Department of the Interior, Washington, D. C.

I READ IN THE PAPERS

Under the heading 'No Magic in Coöperation,' the New York *Times* prints the following editorial without mentioning the name of Aaron Sapiro:

'No Magic in Cooperation'

'Agricultural coöperative associations are much to the fore in Washington and elsewhere. Many public men believe that the only real help which the Government can extend to the farmers is in the form of aiding, financially and otherwise, their coöperative societies. The record of such organizations is not wholly favorable. While some of them have been brilliantly successful, as in the case of the fruit growers of California, many have failed and gone out of business. None of the latter class can have crashed more disastrously than the Tri-State Tobacco Growers' Association, now in receivership.

'The details, as sent from Raleigh, N. C., to the Greensboro *News*, are eloquent of the real causes of the failure. During the four years of the association's existence, it took in some $98,000,000, but laid out no less than $20,000,000 for "expenses." No business could hope to stand up under such an operating cost as 20 per cent. There is no charge of squandering the funds of the Tobacco Growers' Association, although it paid a good many suspiciously high salaries and made certain outlays which were pretty nearly of the nature of a dead loss. The tremendous and unbearable overhead was due to bad management and lack of grasp of the market situation. In effect, as the Greensboro *News* says, "the people who did not know how to market paid the people who 'thought they did' " a tribute of about $5,000,000 a year. The whole showing is pretty sorrowful, and while it does not prove that agricultural coöperatives are necessarily inefficient, it does serve as a warning that there is no magic in coöperation as such.'

And yet we can't help sighing for the good old days when men were men and women weren't.—Windsor, Ontario, *Border Cities Star*.

Serving on the jury is a citizen's duty, but very often the juryman feels that it is a thankless job, for which he has to sacrifice his time, his money and his business interests without reward. Recently a defendant tried to overturn a jury verdict on the plea that during the course of the trial argument, one of the jurors had fallen asleep in the box. The indignant juror maintained that he wasn't sleeping, but that he had merely closed his eyes the better to mull over the legal problem presented for his adjudication. The judge sustained the juror. A jury sat with a lunacy commission in a New Jersey court; when the time came for them to deliver their verdict as to the sanity of a woman, they refused to render their judgment until they had been paid a higher fee. Commissioners, attorneys, medical experts and court attachés waited in dismay, while the twelve good men and true held out for three dollars apiece instead of the two dollars which was offered them. The foreman voiced the grievances of his associates by explaining that the jurors were losing money by serving all day 'when you take so long about it,' and that they refused to give a verdict 'until you pay us all three dollars.' The commissioner suggested that the sheriff was the only person with authority to grant the jurors' demands, whereupon they marched out to deliberate. On returning they demanded and received the regular two-dollar fee, but refused to sign the vouchers until the sheriff had paid them the extra dollar. 'We reached a verdict before we left the courtroom,' said the foreman. 'We're not going to sign those papers until we get our three dollars. But we'll give you a chance and get our money afterward. The lady is insane.'

Cash-and-Carry Jury Service

By this time Europe probably believes that the money she borrowed here was hers in the first place.—Detroit *Free Press*.

In an attempt to reach worthy boys in remote places, such as isolated ranches and farms, the Boy Scouts of America are trying something new. A scout survey has shown that there are many youths who promise much in scouting but who live too far from their neighbors to make troop organization and control possible. The Boy Scouts plan to have 'mail troops' which will take care of such cases, welding the widely separated 'lone scouts' into a working organization. Possibly two or three times a year there will be a gathering of these widely separated scouts into district centers where they can compare notes in camp and plan for future meetings and activities. The 'correspondence scoutship' is an application of the extension university system, and if properly handled should develop into something worth while. Life on the farm and in the forest offers little social outlet for the lonesome boy and the scout plan will help to fill that need.

'Mail Troops' Latest Scout Idea

Wooden canoes, hastily constructed by old-timers, saved the day for inhabitants of Hartsville, Tennessee, when the river went on the rampage there. A local lumber yard furnished the lumber for the hastily improvised boats and the following day a small fleet plied across more than a half-mile of turbulent water to the farming regions for provisions. Thrown on their own resources, their pioneering instincts asserted themselves.

The International Jew in 4 volumes: *The International Jew*, Vol. I, 235 pages; *Jewish Activities in the United States*, Vol. II, 256 pages; *Jewish Influence on American Life*, Vol. III, 256 pages; *Aspects of Jewish Power in the United States*, Vol. IV, 246 pages. Price: 25 cents each; set $1. THE DEARBORN PUBLISHING COMPANY, DEARBORN, MICHIGAN.

One time-cherished institution of Middletown, New York, has been forced to succumb to the march of progress. The historic Montgomery Horse Thief Detecting Society has disbanded because the coming of the automobile has caused members to feel that the society has outlived its usefulness. There is $1,000 in the treasury which will be divided among the seventy members. In the old days the society was largely instrumental in sending large numbers of horse and cattle thieves to prison.

Auto Thief Displaces Horse Thief

The five United States Army planes participating in the Pan-American good-will flight are now some distance beyond Nicaragua.—New York *Times*.

Dusky Bedoins and Arabian slavers will wonder at the monster which will some day traverse their deserts. A gigantic motor vessel nearly 300 feet long, 38 feet wide and standing 50 feet high, resting on four huge wheels nearly 40 feet in diameter, may sometime cover the desert miles at a rate that will put the camel to shame. Extremely soft sand will not interfere with its progress, according to engineers working on the plans. It will operate independently of high roads or trails, taking an airline from start to finish. Three hundred persons may ride with fifty tons of freight. Pilothouse, bridge and searchlight will further its resemblance to a gigantic ocean liner. Mighty gasoline engines will supply the motive power.

A Future Ship of the Desert

It would help some if the Senate, after rejecting an application for membership, should arrange for the applicant to get back his initiation fee.—Buffalo *News*.

The Milwaukee bookworm need not bundle up and make his way to the library through the winter's storm or suffer the summer's heat in the open. He merely reaches for the telephone and orders his library books which are later sent by mail. This is part of a program to make it as easy as possible for the public to get good reading. It applies at the main library and the fifteen branches. Those who wish quick service on books at hand may have them stamped for special delivery and receive them a few hours after placing their order by telephone. This, in most instances, is less than the cost of the reader's car fare to the library.

Library Books Sent by Mail

The price to be paid for the Cape Cod Canal may seem more than it is worth to us, but it must be remembered it is a great convenience to a codfish in a hurry.—Detroit *News*.

Telephone girls on the Burwash trunk line out of London are kept busy telling the world that Rudyard Kipling has no phone. Kipling detests phones and won't permit even as much as a telephone pole on his property.

WHEN WRITING A BOOK, Balzac sometimes worked from eighteen to twenty hours each day for weeks.

NOTES - COMMENTS - CRITICISMS

MR. FORD'S Page this week discusses the misuse of power.

ɤ ɤ ɤ

This number of THE DEARBORN INDEPENDENT appears on the anniversary of Lincoln's birth. It is therefore appropriately a Lincoln number in which many incidents in the great President's life are given to the public for the first time.

ɤ ɤ ɤ

The cover design consists of a portrait of Lincoln with character in every line. It has been cut in linoleum by Dwight C. Sturgis. Facing page 1 there is also a striking and original picture of Lincoln in his law office at Springfield, by Raymond H. Warren. This is a picture with a history.

ɤ ɤ ɤ

Quite appropriately it is an episode in the early life of Lincoln that is first presented in this number. William L. Barton relates a delightful story of how Lincoln when a struggling youth was haled into court on a charge of poaching on the rights of two ferrymen on the Ohio River. It was then he found 'a friend at court' in Caroline Meeker, the niece of the magistrate. (p. 3)

ɤ ɤ ɤ

A man like Lincoln required not the aid of marble or bronze to perpetuate his memory. The good he did 'lives after him' and was not 'interred with his bones.' Nevertheless, not only his own country but foreign nations as well have honored him by erecting statues of bronze and of stone. William L. Stidger, who has traveled much, gives an interesting survey of them. (p. 6)

ɤ ɤ ɤ

It was at the period of the Civil War that Lincoln showed more particularly the man he was. What could surpass in directness his letter to the governors of states just before the first shot was fired at Ford Sumter: 'I think the necessity of being ready increases. Look to it.' No words wasted here. Caesar might have written it. Louis C. Karpinski tells this story. (p. 8)

ɤ ɤ ɤ

From the storm and wrack of war Julia Taft Bayne takes us to the peaceful atmosphere of the White House. Here her two brothers were the playmates of the Lincoln boys. Mrs. Taft Bayne affords some delightful glimpses of the domestic life of the Executive Mansion at this time, drawn from her own personal recollections. (p. 12)

ɤ ɤ ɤ

Carl Sandburg calls Lincoln 'the most traced character in American history.' He means by this that since Lincoln's death, and particularly at the present time, biographers and paragraphists have been hunting up every shred of information regarding Lincoln's career from the nursery to the necropolis. Carl Sandburg has unearthed some incidents that all will read. (p. 16)

ɤ ɤ ɤ

Returning to Lincoln's earlier days J. T. Faris gives some close-ups of his life in New Salem where he clerked in a store, thrashed a bully, and acted as postmaster. It was the period following his farming and rail-splitting career, and it all formed part of the training which made Lincoln what he was—the greatest figure in American history. (p. 19)

ɤ ɤ ɤ

On page 5 of this number appears a timely article by J. J. Dewey, the main thought of which is, 'Are we scrapping the whole Navy?' It is an article of which Lincoln would have approved. A man of peace, he took prompt action when the Union was threatened. American integrity still demands adequate safeguards. The Navy is one of the most important. (p. 5)

ɤ ɤ ɤ

Knud Rasmussen, who has many times returned from prolonged explorations in the polar regions, finds the noises of the cities more distracting then the roars of platoons of walruses. His analysis of city smells and sounds is startling. (p. 1)

ɤ ɤ ɤ

As a super-example of losing the substance while grasping at the shadow the great Anneke Jans delusion stands alone. (p. 14)

ɤ ɤ ɤ

Here are a few reasons why people read THE DEARBORN INDEPENDENT:

8516 Apricot St., New Orleans, La.

I find your paper the most interesting paper published today. It uncovers a lot of hidden things which the daily papers don't publish and which the public ought to know.

J. JOACHIM.

Hood River, Oregon.

Just want to tell you how much we enjoy THE DEARBORN INDEPENDENT Although we are regular subscribers to seven of the best magazines we pick up THE DEARBORN INDEPENDENT and read it through.

There is a world of information concisely told and we feel that it is authoritative.

MRS. WALTER JOHNSTON KNIGHT.

Athens, Illinois.

I am glad to subscribe to a magazine whose publisher has backbone enough to tell the truth.

GEORGE W. BOYD.

Walters, Oklahoma.

I take much pleasure in reading the Dearborn, considering it a clean, educating magazine, devoid of crime, which makes it a desirable paper to have in one's family. I do not fail to read every article in the paper.

J. W. BROOKS.

DWIGHT C. STURGIS, designer of the striking delineation of Lincoln on our cover, is staff artist of the *Christian Science Monitor*.

KNUD RASMUSSEN, the famous Danish explorer, has made numerous expeditions to the arctic regions and has been repeatedly honored by the King of Denmark.

WILLIAM E. BARTON, as an authority on Lincolniana, has dealt with almost every phase of the President's life. But he is constantly making new discoveries.

J. J. DEWEY is a writer who at an early age was connected with the United States Navy and has since made a special study of warships and their equipment.

WILLIAM L. STIDGER, pastor of the Linwood Boulevard Methodist Church, Kansas City, has traveled extensively in all parts of the world, and in doing so has particularly noted things American.

LOUIS C. KARPINSKI, professor of mathematics in the University of Michigan, has made a special hobby of old maps, old books and old letters. His 'finds' are always interesting.

JULIA TAFT BAYNE is a cousin of Chief Justice Taft; also of Admiral Willard H. Brownson, of the United States Navy, retired. In her youth she was on intimate terms with the Lincoln family and a frequent visitor at the White House.

CHARLES ALBERT COLLMAN is well known as a publicist and writer on financial subjects.

CARL SANDBURG'S life of Abraham Lincoln entitles him to be ranked as an authority on this great American, but there were left untrodden paths in the biographical field which Mr. Sandburg still explores to advantage.

J. T. FARIS, editor and clergyman, has been director of the editorial division of the Board of Christian Education of the Presbyterian Church in the United States since 1923.

Spanning *the* Water

Perils *and* Problems *of* Bridge Building

This bridge at Acanbarro, Mexico, is so many centuries old that its beginnings are obscure. It is of the arched masonry variety, which was used over a very long period of time before perfection of modern construction methods. The early builders were often so accurate in grinding the stones that no mortar was needed.

CHRONICLER OF THE NEGLECTED TRUTH

EBRUARY 19, 1927

Five Cents a Copy

UNIVERSITY OF ILLINOIS

PHYSICAL necessity moves man to labor. ∾ Mental necessity moves him to reason. ∾ Spiritual necessity moves him to believe that life has a meaning, hat the method of it is progress. ∾ The wind of destiny blows him ever toward a large ıopefulness. It also drives him to see that his direction is upward. ∾ Equality ıy degradation has proved a failure; equality of ascending opportunity has lifted the world.

THE FRIENDLY DOOR

Richard Newman

A WELCOME portal! Worn by passing feet
Is the threshold which for a century or more
Behind its shelter has offered a retreat
For youth and age alike—the friendly door.

A silent sentinel it stands, holding the place
It held through all the years, and o'er
It clings a quiet dignity and grace;
Time's softening touch—but still the friendly door.

ECONOMY—*the* Poor Man's MINT

Does the Installment Plan *Represent the Best That* American Business *Can Do?*

By HENRY LAKET

LIKE the snows of yesteryear, which have melted and gone, the ancient maxims which sought to teach us to be economical and thrifty have disappeared. Ancient is the proper term—thrift has been the theme of the wisest minds of the past. Today but few new voices are raised in favor of *economy for individuals and families*, although there are hundreds who urge its precepts in connection with the management of *business and industry*.

It is a new age, of new things, of course. But are conditions today so different that it would raise a laugh if Cicero's words, 'economy is a great revenue,' were quoted, or that 'economy is the poor man's mint'? Benjamin Franklin's wisdom on this subject, popularly quoted in past decades, has been strangely quieted in recent years. Once we saw on every hand reprints of his famous thrift sayings, such as 'beware of little expenses, a small leak will sink a great ship,' or that more pungent one, 'ere fancy you consult, consult your purse.' Clearly appropriate to the present times of general prosperity is Franklin's wise warning that 'gain may be temporary and uncertain, but ever while you live expense is constant and certain, and it is easier to build two chimneys than to keep one in fuel.'

Confucius some 2,550 years ago warned that 'he who will not economize will have to agonize.' This subject has attracted the finest minds among men. Emerson said, 'a creative economy is the fuel of magnificence.'

The old-fashioned lessons of thrift are not forgotten but are in obscurity today. Suppression fits better the needs of those who are at the present time most concerned with the widespread installment selling system whereby intensive methods are applied to selling things to people on 'easy payments.' Almost anything which falls into the luxury class can be bought today for a small down payment or often without a down payment, and paid for thereafter in small weekly or monthly installments. But it is likewise one of the outstanding features of the present situation that only 'luxuries,' so-called, can thus be easily obtained by anybody and his brother on the installment plan, and that *necessaries of life are sold today strictly for cash*, or its equivalent.

IF ANYONE wants a luxury today—a ring, a brooch, or jewelry of any kind, or fancy furniture, a high-priced automobile, a musical instrument or talking machine, or an ice machine to displace the 'old-fashioned' ice man, or a fur coat, or anything else which at the present time cannot strictly be classed as a necessary of life—the way is wide open and made extremely easy for such purchases on a financial plan which its opponents have called 'mortgaging the future.' This definition of the throttling hold which installment selling puts on future income, earnings, wage and salaries, could be offered only to a generation that does not know the horror with which its forbears heard the very word 'mortgage.'

It is contended that the very basis of our continued prosperity rests on the huge spendings by the public on the installment plan and the consequent increased demand for manufactured goods and raw materials to supply it, thus creating great business and industrial activity and continuous employment throughout the nation at high wages—which are in turn spent freely, making a complete and self-perpetuating prosperity cycle.

Granting for sake of argument that some installment selling is benevolent in its primary aspect—that is to say, that it enables people who will not or who *cannot* save, to obtain more and better comforts and to pay for them as they use them; and calling it what you will, the fact remains that he who buys must toe the mark regularly and that his income is indeed mortgaged; that another hand has a grim grip on his purse and thus holds him until the just dues of his creditors have been settled in full. There is no doubt of the enervating and discouraging effect on wage earners and salaried and small professional people if this condition is long sustained.

There is a tendency to put everything on the installment basis, under the growing system today, with the exception of *staple products* and *necessaries* of life. For important reasons these have failed to be included in the current installment plan. The business of supplying the necessaries of life may thus construct for itself a substantial foundation at the expense of the growing insecurity of the business which deals with sheer luxuries. Huge paper assets are involved in the in-

stallment system, in the sequence of transactions from factory to consumer; the discounting of these would be so great as virtually to wipe out a large section of the present business structure—that part, that is to say, which is addicted to chronic installment selling.

Carlyle said, 'There are but two ways of paying debt—by increasing one's industry to raise one's income, or increasing one's thrift in order to pay out.' But where all of one's income is mortgaged against installment purchases, thriftiness and the saving habit, when they have been forced home as a crucial necessity, are almost impossible—it is too late then.

Franklin was full of sound advice on this subject. 'A man may,' he says, 'if he knows not how to save as he gets, keep his nose all his life on the grindstone and die not worth a cent at the last.' Bacon's idea was that 'if a man will but keep an even hand, his ordinary expenses ought to be but the half of his receipts; and if he thinks to wax rich, but the third part.' Dr. Johnson calls it the 'science of sparing.' 'Without economy none can be rich, and with it few can be poor,' he says.

DOES the installment plan represent the very *best* that American business can devise? Does it mean that sales cannot be made any more for 'cash,' that American business has been forced to fall back on the 'convenient payment' plan to subsist? And if so, what may happen when—as may occur—even the 'hothouse method' of selling on the installment plan ceases to be effective?

What will happen to business and industries based solely on installment selling should the American public generally fail to be induced to buy their goods even on 'easy payments'? Does the prevalence of installment buying at the present time mean that people cannot buy for cash, and if that is the case, with their future income largely mortgaged by deferred payments on installment purchases, how may they be expected to return to a cash basis?

The whole system started from the selling end. It is clearly installment *selling* which is uppermost, and not installment *buying*. The urge is *not* from the people; it is wholly a salesmen's campaign. It began as a system of selling which would reduce sales resistance to a point where *the total price of an article was of less significance to the buyer than the terms of payment.* It was not, and is not today a question primarily with the customer of how much the *price* might be, but how much must be paid weekly or monthly to effect its purchase.

THE problem has taken the form of 'how much can I afford to pay each week, or each month, for this thing which I want, and which I want mainly because of wonderfully attractive advertising and clever salesmanship, and because I am told that we as a nation are so prosperous and that the standard of living is so high that we can all afford to own these things. The final cost is not the point with me so much as the question of paying every week, or monthly, a sum which I can afford or which sounds so reasonable that I think I can afford it.' The high cost of living—'old H. C. L.' it was called—has of late been cleverly translated into the newer and flattering term, 'the high standard of living in America.'

To maintain the superstructure of the installment business it is necessary to put it as soon as possible upon a one-price basis, that is to say, to assure the buying public that the article is sold only at one price, the same price to all, whether for cash or on the 'easy payment plan.' Thus there is ceasing to be, in some lines today, anything like the former 'cash' or 30-day payment price. The cash price is now set, in such lines, at what it costs to sell on the installment system. This naturally must be higher than a cash price. Credit is a very expensive commodity. It is never given free. Indeed, it is always sold very much above cost.

On some products, such as sewing machines and some talking machines and pianos, the chronic method of selling these necessaries—once upon a time they were luxuries—on the time-payment plan, dating back some forty-five years or more, has become so deep rooted that it is probable that there are few manufactured articles which could show a greater disparity between actual manufacturing cost and final selling price. And this state of things, under widespread installment selling, is spreading to other commodities. Selling credit is becoming, proportionately, a more profitable business than manufacturing goods. Creating debt pays better than creating tangible values. The public can never hope to get the monetary benefit of scientific production, larger volume or of better materials and methods of manufacture, or improved means of distribution and handling, and generally lower costs. The easy-payment plan tends to wipe out much of the progress which marks the development of American business and industry to date.

The installment plan as yet is peculiarly distinctive of the marketing of that class of merchandise and things which are definitely included in what may be termed 'luxuries'—with the exception already noted of the sewing machine. Of course many of the luxuries of today will be the necessaries of tomorrow. Necessaries of life, however, such as groceries, drugs, electric light and gas service, clothing (for utility), foods in general, telephones; these have, since the war, been put on a strictly cash basis. People pay immediately for these things to a greater extent than was ever before the case.

THE reason for the change may be many-sided, but one of the paramount reasons certainly was the consciousness by retailers of the fact that the credit-buying human being had a strong inclination to neglect payment for these necessary purchases—these genuine necessities—in favor of payment on luxuries or less-essential purchases. The merchant who dealt in specialties and articles bordering on the luxury class was able to compel payment by an annoying follow-up collection system which brought results. The seller of genuine necessaries of life found for some unexplained reason—probably the familiarity of old custom which bred contempt—that such collecting methods did not bring in the money and if it did it also served to make the customer 'mad' and caused an indirect loss of business in that way. Hence generally after the war the introduction of the 'cash and carry' stores and other factors permitted the placing of the business of selling necessaries on a substantial cash basis which is now well established throughout the country.

In time, as some of the present luxury articles begin to enter the class of 'necessaries of life' it will be found that payments will slow down and can be kept going only by forcible means. Luxuries of twenty-five years ago—the automobile, the telephone, dental services, sewing machines—are urgent ne-

The Way We Suppress Crime in Milwaukee

By DANIEL W. HOAN

J. G. Laubenheimer, chief of the Milwaukee police department.

On September 30, 1925, Roy Little, Paul Hurtt and Lawrence Walsh, professional criminals, arrived in Milwaukee.

At about seven o'clock in the evening they held up a jewelry store, slugged the proprietor and escaped with a big haul.

Fifteen minutes later they were arrested by a Milwaukee detective.

Next morning they were sentenced in the municipal court to a minimum of twenty years' imprisonment.

By night they were in the penitentiary.

Stanley Lubinsky, with aliases, arrived on March 13, 1926. He committed eight holdups. The same night he was arrested.

On the morning of March 15 he was sentenced for three to thirty years. *The delay of one day was due to the intervention of Sunday.* Lubinsky had been sought by police of Detroit and elsewhere.

William Knight, John Valaitas, Clarence Fitz and John Malloy held up a pawnshop in Milwaukee on April 1, 1926. They were arrested the same day.

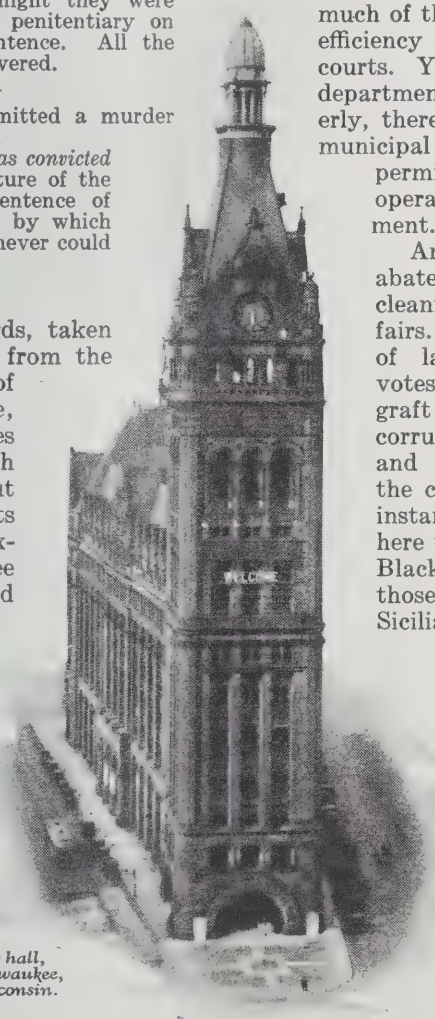
By the following night they were residents of the state penitentiary on three-to-thirty-year sentence. All the stolen goods were recovered.

John Steinert committed a murder on December 17, 1925.

Two days later he was convicted and because of the nature of the crime was given a sentence of life and twenty years, by which it was assured that he never could be pardoned.

THESE records, taken at random from the police files of Milwaukee, are examples of the manner in which this city metes out justice and protects its citizens. In part it explains why Milwaukee has come to be called 'the crimeless city.'

Milwaukee, of course, is not wholly without crime. No city ever will be. But statistics tell us that this city has the lowest crime record of any large city in the world. It is as safe for women and children to traverse the streets of Milwaukee as it is of any small village. 'Gangs' have vanished. During 1925 every other large city in the United States experienced an increase in burglary insurance rates of twenty to one hundred per cent. *Milwaukee received a reduction of twenty per cent.* No other city enjoys such a low rate of automobile theft insurance. And while the country is said to be in the surge of a 'crime wave,' Milwaukee is steadily reducing its record of crime and lawlessness.



City hall, Milwaukee, Wisconsin.

On being asked why this city is thus blessed, I have suggested that much of the credit is due to the efficiency of our police and courts. Yet in order that these departments may function properly, there must be a complete municipal program that will permit the free and sure operation of law enforcement.

Any effective plan to abate crime must start with cleanness in municipal affairs. Winking at any form of lawbreaking to gain votes, campaign funds or graft will inevitably lead to corruption of police officials and brazen activities by the criminal element. For instance, it was observed here that certain suspected Black Hand leaders were those who lined up the Sicilian vote on election day. All favors from the city hall, whether for parade permits, for municipal jobs, or for employment on railroads, were passed out through these leaders. They were consequently feared by their countrymen as pagans feared their gods. This situation sealed the lips of these overawed people when they had knowledge of crimes committed. The police were powerless to ferret out the guilty.

Diplomatic relations with these leaders were then severed. The city administration dealt directly with the honest element among the Sicilians. They soon began to feel a new independence. Black Hand crime disappeared.

Milwaukee tries to abate crime by getting at its roots, and realizes that halfway measures will not suffice. The local issue is: 'Honesty and Progress versus Corruption and Crime.'

In the police department it is made more profitable for an officer to be honest and efficient than dishonest and inefficient. These methods have almost eliminated the crimes of those who expected immunity, and the crimes of transient criminals who expected to escape through police inefficiency. Between the police department and the courts there is also the greatest coöperation.

Besides the handling of persons already possessing criminal tendencies there is the equally important problem of preventing the development of such tendencies. With this object in view, Milwaukee has centralized supervision of playgrounds and social center work in a bureau under the educational department. All supervisors of recreation are selected under a merit system and schooled regularly in promoting efficiency in their work. Programs of play, recreation and instruction are mapped

Daniel W. Hoan, mayor, city of Milwaukee.

out to meet neighborhood conditions, to take advantage of local voluntary talent, to give as large a measure of self-government as is compatible with the rules, to promote character forming, and to make the most of the energy and money expended.

The greatest advantage is taken of public parks, piers, beaches, schools, halls and facilities of whatever nature to provide an intelligent recreational and instructive program. Expansion takes place in such things as band concerts, zoo facilities, racing of any nature, wading pools, playground apparatus, baseball, football and golfing fields, tennis, croquet and picnic grounds, bathing beaches, dancing in parks. The most is made of winter sports, and wholesome civic demonstrations are provided on holidays and other occasions.

Everywhere that playground activities have been introduced, juvenile lawlessness has decreased 70 to 80 per cent.

Theaters, dance halls and gambling engage police activities. Milwaukee's theater program includes a system of censorship of motion picture films under the supervision of a board coöperating with the exhibitors. Features likely to incite persons to crime or immorality are eliminated. Revocation of license is the penalty for nonobservance.

Private dance halls and gambling are under the supervision and control of the police. Each dance hall is licensed and the police department is charged with making reports as to the advisability of granting these permits. Commercialized gambling has been suppressed in Milwaukee. This must be done if crime is to be abated and the demoralizing effects of protection money effaced.

The development of the educational program is important in the matter of law enforcement, and in Milwaukee includes the establishment of prevocational schools. Entering such institutions where a combination of industrial, educational, and recreational methods are employed, those children marked dull in regular grades become enthusiastic scholars and develop into high-type citizens. The continuation school program furnishes practical and industrial education one full day a week at the employer's expense. This is for children of fourteen to seventeen years who are forced through circumstances to be employed.

Since crime is committed mostly in idle hours, it is essential that employment be furnished to all seeking it. Under the joint auspices of the city, county and state, there is a free employment bureau. This institution holds out a helping hand when most needed. In times of depression this bureau unites employe and employer. Its duty is to provide employment for the largest number by apportioning it in different shifts. It also creates employment by urging activities that would otherwise lag.

Quite important is the matter of improved housing in which most cities are woefully lacking. More than 75 per cent of crime may be traced to poor housing districts. Milwaukee has a commission whose duties are to improve housing conditions in congested districts; to do everything possible to keep rents low; to promote ownership of homes, to assist citizens of small means to obtain building plans free, and to direct them to the proper building and loan or similar organizations where funds supplementing their own may be secured.

The foregoing does not, of course, more than sketchily outline the program which Milwaukee has followed and which must be credited with the low crime record and wholesome living conditions.

Milwaukee has taken the dollar sign out of civic affairs and in its stead has written the word *service*.

One of the reasons for Milwaukee's police efficiency is that the department is a 'business institution instead of a political clubhouse.'

Under the direction of John Bauschek, head of the bureau of identification, the work of the police department has become thoroughly organized. Unlike most police departments, all work, such as identification, automobile theft investigation and crime records, are under one department. Whatever the investigation or variety of crime, all matter pertaining to it is promptly filed for reference.

An example of this is found in the fact that card records of all cars stolen throughout the country are kept up to date, and in the same department are complete card records of every reported crime.

Dealers in used automobiles, as well as pawnbrokers, must make daily reports of their transactions. These reports are checked against current stolen property lists.

A thorough system is applied to the operation of detectives and uniformed men. Each must make out a daily form telling of his activities and disposal of cases. Officers are furnished with a daily printed bulletin describing stolen property or law- *(Continued on page 21*

The BEST BOOKS Are the CHEAPEST

How You Can Get a Library at Slight Cost

By THOMAS L. MASSON

THERE is no occupation in the world more fascinating than reading, and none which is surrounded with more pitfalls for the unwary. Last year I found myself in possession of something over five thousand volumes, most of which were in sets. In going over these sets, many of them of standard authors, I discovered that while they had been taking up valuable space in my library for ten to fifteen years, I had actually used only one or two volumes in each set.

I had three large editions of Shakespeare, and for ten years I had confined my reading to about four of his plays, and these I had read in pocket editions, for which I paid eighty cents a volume, whereas for the sets—heavy ponderous books most of them—I had paid all the way from thirty to one hundred dollars a set. For one set, for which I had paid one hundred dollars and which I was told by the publisher at the time would steadily increase in value, I was offered so little that I concluded to keep it. For another set, for which I had paid one hundred dollars, I was offered eight dollars by one dealer, and finally disposed of it for eighteen dollars. Since I bought all those sets, the price of books has steadily increased, nay over-doubled, yet I sold them for less than half of what I paid. And in practically every instance I was given to understand at the time that they would steadily increase in value. I am glad to note, however, that there were —among say fifteen or twenty sets— one or two exceptions.

I thus sold about fifteen hundred volumes for $600—what had cost me fully $2,000 and which during ten or fifteen years I had scarcely opened (they were such pretentious books that I preferred small editions) and the loss of which I have not since regretted for a moment.

But on the other hand—and this is important—the dealer who bought them sniffed about among those I would not sell and told me he would give me the best prices for these; indeed, he wanted them very much and was quite ready to bid up on them. What were they?

Well, they were odd volumes, histories, biographies, classics—in short, real working books of reference.

This article, of course, does not deal with book collecting as such. That runs up into the thousands, nay into the millions, and is a sport for plutocrats. It is, however, among the élite a most precarious sport, and even if you have a lot of money to squander and time to reflect, you are likely to get stung many times before mastering the subject. Occasionally the first edition of a contemporary novelist, which you might have bought at the time, will increase in price, but the occasion is rare. Then you must remember that you are never sure that it is a first edition.

Pen-and-ink impression by GERALD VAN DER HEYDEN

H. G. Wells' novel, *The World of William Clissold*, now retails in this country in two volumes for five dollars, but this is the American edition and if you wanted the first edition you would have to send abroad for it. Similarly Theodore Dreiser's *American Tragedy* is in two volumes and sells for five dollars, but this is not the first edition, for which as I recall I originally paid seven dollars and a half. This book, autographed by Dreiser, sells for twelve dollars and a half, but I think it is a question whether the autograph will make it any more valuable. Some of Dreiser's first editions, however, have advanced in price.

All this is incidental to my main theme, and I merely make mention of collecting and first editions in order to set them aside, and to get down to the practical problem before us, which is, briefly: What are the best and cheapest and most valuable books I can buy for my money? And I will state at once offhand that for about twenty-five dollars anybody can buy enough books to give him practically all he needs to know. Take Shakespeare alone—a world of reading in itself. There are a number of Shakespeares in one volume. The Globe has generally been considered the best, but I myself like the Oxford edition on India paper which can be purchased for as low as three dollars and a quarter* and if you like a better binding all the way up to seventeen dollars and a half. Some people object to the India paper, for while very durable and tough, it is thin, but personally I like it very much as it saves so much space.

Before going further into the matter of these cheap books, however, let us consider the flood of contemporary literature being poured out, each volume of which is widely proclaimed by the publisher as a masterpiece, an 'epoch-maker.' You can buy few current novels for less than two dollars and during the past year the prices have advanced so that now many single-volume novels sell for from two dollars and a half up to four dollars. I have already mentioned Wells and Dreiser. Galsworthy's *Silver Spoon** sells for two dollars; Arnold Bennett's *Lord Raingo* for two dollars and a half; Sherwood Anderson's *Tar* for three dollars and the autograph edition for ten dollars, which is a nice way for Anderson to make seven dollars by a stroke of the pen.

When it comes to non-fiction, the prices are very much higher. Roy Chapman Andrews, who recently made his trip through Manchuria and has written a very interesting book (*On the Trail of the Ancient Man*), charges six dollars for the privilege of reading it. It will cost you ten dollars if you wish to possess *The Intimate Papers of Colonel House*, and Brentano's has just issued a two-volume edition of Milton's poems for ten dollars, whereas in a

*The prices given here are subject to change, as some of them are taken from catalogs where the books may since have been advanced in price. For instance, the books of the Home University Library (Holt) originally sold for fifty cents, but have been advanced to one dollar.

pocket edition (which you will not be afraid to read if you care for Milton) you can buy him for eighty cents. Hervey Allen charges ten dollars for *Life and Times of Edgar Allan Poe* and Noel Baker's book on disarmament sells for three dollars and seventy-five cents. Most contemporary travel books, many of them sumptuous. sell for even higher prices, because of the expense of illustrations.

The reason for these high prices is that the cost of bookmaking has never been so high, and also, as the public has more leisure and more money, it demands better-looking books. But for you and me, as I take it, while we may occasionally take a flyer in an expensive book, we are looking for the most for our money. And here it must be remembered that the publishers have not failed us. For alongside these flaunting best and moderate sellers of high degree, there has come a kind of underground line of pocket editions, which in cheap available form cover practically every standard book and all the classics. Also, it is comparatively easy to locate these books, with a little study.

IN 1925 there were published in England 13,202 different editions of books, of which 8,520 were new. In August, 1926 (Publisher's Weekly), there were published in this country 722 books, 510 of which were new editions. Among these, seventy-six were fiction, thirty-four biography, forty-three juvenile and thirty-nine poetry and drama.

Of this vast number of books, probably not one per cent will survive.

Also it must be remembered that any book which does survive is invariably published a few years later in a cheaper edition. Several publishers (notably A. L. Burt and the Crowell Company) make a specialty of reprinting these books in cheaper editions, and indeed the original publishers themselves also reprint their own books in cheaper editions, after they have run their course. Originally Wells' *Outline of History* in two volumes sold for ten dollars and a half; later it was issued in one volume and it has been growing steadily cheaper ever since.

It will be readily seen, from what I have written, that if you and I, who are merely people ambitious to improve our minds in the most practical way, are puzzled as to what books to buy, what the problem must be for librarians. Most libraries, large or small, have to manage on a regular budget. The problem before them is to meet the public demands immediately, at the same time investing in those books only which are likely to endure. The waste in fiction is enormous. A year ago the public took hold of a book by Margaret Kennedy (*The Constant Nymph*) and thousands of copies were sold. One of the largest booksellers in the United States told me that in one day the sale of this book stopped as if by magic. Thus works of fiction rapidly succeed one another.

I have piled in my library hundreds of novels issued within the past year or so which nobody will ever hear of again. Yet from these it is undeniable that a few books come which are necessary if you wish to do that lively thing, 'keep up with the times.' Among these, in my opinion, the books of John Galsworthy stand first among English novels of today, and his *Forsyte Saga* (two volumes in one) at two dollars and a half is well worth placing in one's library. Personally, among American writers of fiction, I incline to the books of Harry Leon Wilson, Ring Lardner, Edith Wharton, Joe Hergesheimer, Booth Tarkington. Still, the test comes by asking yourself whether you would care to read their books over again.

Years ago, when Theodore Roosevelt went to Africa on a hunting trip, he took with him what was termed a 'pigskin library.' Unfortunately, I do not happen to have at hand a list of these books, but as I recall them vaguely—or rather the impression—there is not one of them I would care to read today.

Mark Twain used constantly to read Carlyle's *French Revolution*, and I believe it was the only book which accompanied him to his deathbed. I have never been able to read this book through, and also I have always felt that it was inaccurate. Still, most books of history are full of errors, and one has to read between the lines. The fact is, no list of books compiled by one man will do for all men. And here again are various considerations, chief among which is that of temperament. Are you a literal-minded person, or an atypic? By atypic I mean one so liberal in his thought that he likes anything provided it is well done. Such a mind will revel equally in the poetry of Milton and the description of Greece by Pausanias. These two opposite types of mind may be defined as the idealist and the realist. Also, much depends on one's education and taste.

MY own children have been brought up surrounded by all the poets, yet none of them will read a line of poetry, while I myself am a poetry addict. If you like poetry and want to get a new point of view, read a little book on Walt Whitman, in the 'English Men of Letters Series' (an excellent series, by the way, published by Macmillan at a dollar and a quarter), written by John Bailey.

And this leads me to the heart of my theme, the pocket editions.

I made my own discovery about pocket editions many, many years ago in Kansas City. I was passing through that even then lively town and chanced to stop before a bookstand and for twenty-five cents snatched up a Temple edition of one of Shakespeare's plays. The volume was so small and the type so good that by inquiry I got more, so that in time I had nearly all of them.

One day I picked up a catalog of books issued by a London publisher and became fascinated by its contents. I decided to try an experiment, so just for fun I dropped a line to this man in London and asked him please to mail me a book (it was a very cheap book, I think only about a dollar). In about a month the book came. From this on I became interested in book catalogs and especially publishers' catalogs and this is what I mean fairly when I speak of the underground currents in book buying. You do not need to have anyone give you very much advice about books, because for a very little you can make a fine start, and from then on the thing unfolds itself. Let me here suggest just a few books and a few of the most notable series.

YET even here I was caught napping. I wanted to get a copy of Buckle's *History of Civilization* in England. I knew that Arthur Brisbane had published an edition in this country, with a preface of his own. But on trying to get this book, I was told it was out of print. I then ordered the regular edition, in two large volumes, and I am ashamed to say how much it cost me. A few days later I discovered that it was published by the Oxford Press in their World's Classic series, in three volumes for two dollars and forty cents, or eighty cents a volume. These little books are a trifle more than three inches wide and less than six inches deep and are easily slipped into the pocket.

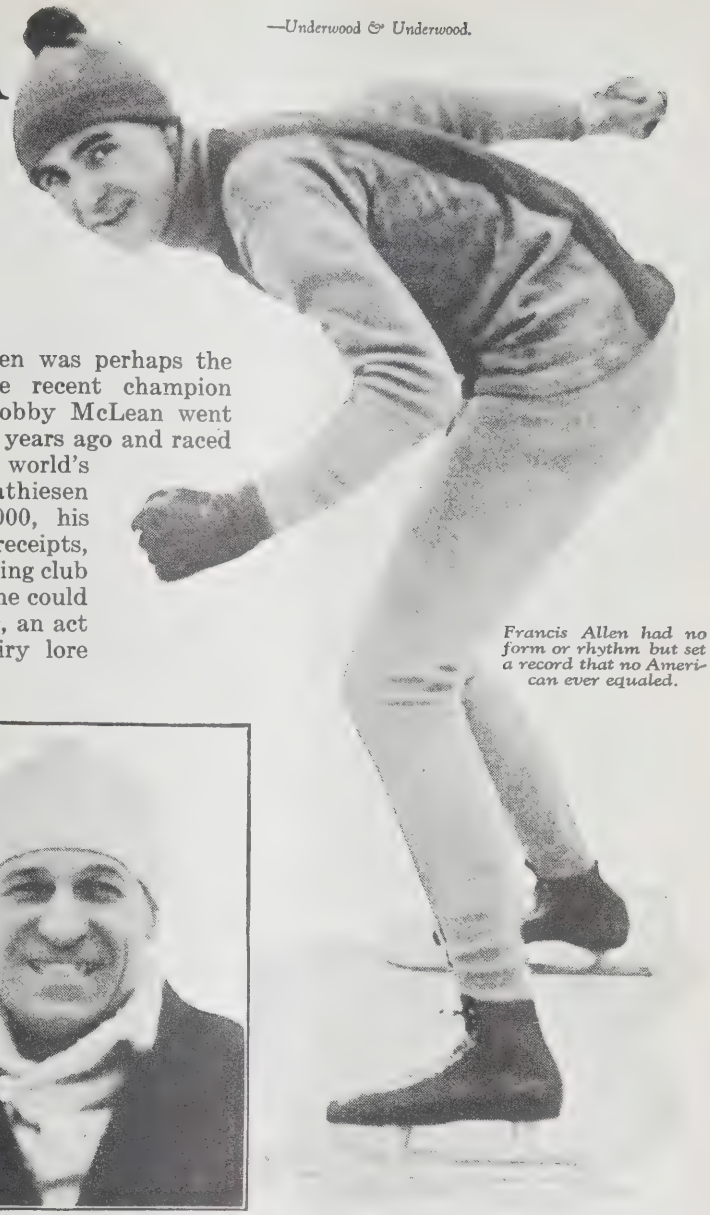
More than three million of this series have been sold. Among them are Darwin's *Origin*, Emerson's *Essays*, Gibbon's *Decline and Fall* (in seven volumes at eighty cents a volume), Thackeray's *Henry Esmond*, and Longfellow's *Hiawatha*. Also, almost identical with these volumes are Plato's *Republic*, translated by Jowett, for five dollars and thirty-five cents, and the *Electra* of Euripides, translated by Murray, for ninety cents. In the Modern Library (New York) we have a book six and a half inches long and four and a quarter wide, printed in larger type than usual with flexible covers. In this library, the price of each volume of which is ninety-five cents, are such books as *Alice in Wonderland*, Poe's *Best Tales*, and Hudson's *Green Mansions*, which I think will prove an enduring work of fiction. Other publishers who specialize in pocket editions, (Continued on page 2

CHILLED DRAMA

Streaks on Ice

By H. G. SALSINGER

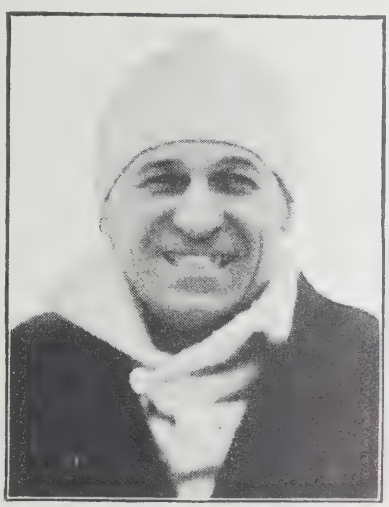
—*Underwood & Underwood.*

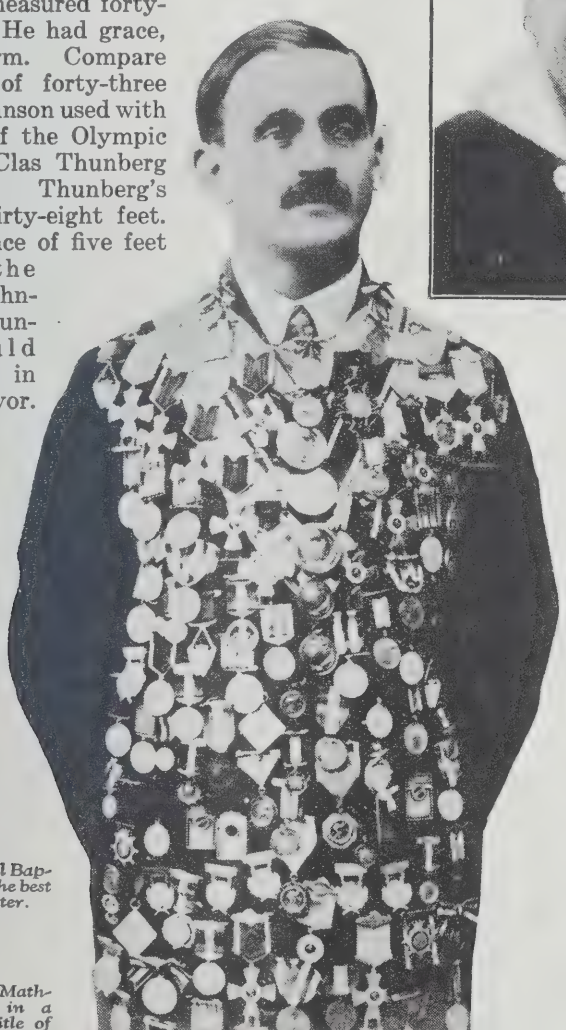


Francis Allen had no form or rhythm but set a record that no American ever equaled.

SPEED skaters have increased in number year by year, but to select the best skater of all time one might have to travel back nearly half a century. Records, unfortunately, will not supply a definite answer to the argument. Speed skates of forty years ago are curious relics today. Skates have been constantly improved by science. They have been made lighter, finer, and with perfect balance. The modern skates are responsible for clipping seconds from the records of distances under two miles. Who knows but that some of the men that raced on those queer blades thirty-five or forty years ago could not shatter all present-day marks if they were in their prime?

John S. Johnson was the leading speed skater back in 1889. His stride measured forty-three feet. He had grace, rhythm, form. Compare the stride of forty-three feet that Johnson used with the stride of the Olympic champion, Clas Thunberg of Finland. Thunberg's stride is thirty-eight feet. The difference of five feet between the strides of Johnson and Thunberg would mean much in Johnson's favor.





Center—*Norval Baptise is probably the best all-round skater.*

Below—*Oscar Mathiesen can put in a claim for the title of greatest speed skater.*

Oscar Mathiesen was perhaps the best of the more recent champion skaters. When Bobby McLean went to Norway several years ago and raced Mathiesen for the world's championship, Mathiesen turned over $30,000, his share of the gate receipts, to the national skating club of Finland so that he could remain an amateur, an act that reads like fairy lore in the United States. Incidentally, Mathiesen beat McLean for the world title.

If the best skater of all time were to be elected by a jury, Mathiesen could put in a strong claim. He was, at least, the best judge of pace that ever engaged in speed skating. He had the same uncanny judgment of pace in skating that Paavo Nurmi has in running. He was just as fast skating alone as in competition. He broke record after record, chiefly because of his knowledge of pace. Norval Baptise can lay claim to being the best all-round skater of all time. Baptise was born on a farm near Bathgate, North Dakota. He learned to skate on a mill pond near his home. At fifteen he won the championship of North Dakota. In 1898 he defeated John S. Johnson, but Johnson, at that time, had slowed down considerably. The following year Baptise met Johnny Nilsson, regarded as the best skater of the day. He beat Nilsson. On the last two days of the year Baptise cracked two world records. He cut the quarter-mile mark to 28 1-5 seconds and reduced the one-mile record to 2 minutes 8 seconds. Six years later Baptise met Nilsson, Harley Davidson and Peter Sinnirud at Montreal for the world championship. Baptise won the title.

Baptise engaged in many other events, set several more records and won various minor titles on both sides of the border. He engaged in freak numbers. He skated (*Continued on page 24*)

HAS Our Country a Father?

Need *for the* Restoration *of the* Real Washington

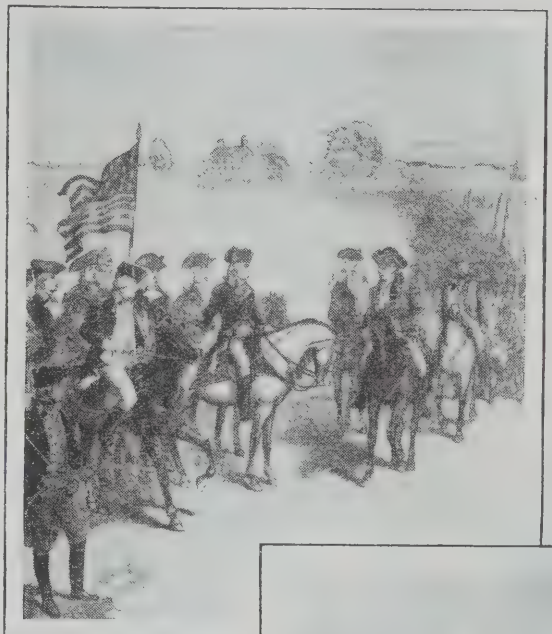
By WILLIAM E. BARTON

GEORGE WASHINGTON was first in war and first in peace. There was a time when he was first in the hearts of his countrymen. That time is past. A vote taken among school children, politicians or men of affairs would generally rank Abraham Lincoln as the first American. My own admiration for Abraham Lincoln is on the whole greater than that which I feel toward George Washington. But I count it a distinct loss to American thought and especially to the idealism of American youth that his name now serves in almost any typical American gathering primarily as the occasion for a banal joke about the cherry tree and little hatchet. George Washington has suffered at the hands of his idolators, of the 'realists,' and of the joke-smiths. This article is a plea for a renewal of reverence for America's first President.

He deserves our reverence. He has been starched and frozen and dehumanized by those who have sought to make him a demigod; he has been vulgarized and cheapened by those who have professed to undo that wrong; and he has been made the butt of the slap-stick comedian at banquets and in formal orations. What we need, and what our children ought to have, is a Washington who is human and a hero. When we find him we shall find the real Washington. We shall not discover him in the pages of the vulgarized realists.

The first printed biography of George Washington appeared in the year 1800, in a pamphlet of 82 pages. It ran through about five editions with little change in form, and none, so far as I observe, in subject matter. In the sixth edition, as I suppose, it underwent marked modification. It was greatly enlarged as to bulk, partly by making the pages smaller and partly by the addition of new matter. It became a work of 244 pages, and it ran to over forty editions. In this article I speak with some flexibility of the pages and editions. There is some uncertainty as to the precise number and order of some of the editions.

I have recently examined the large collection in the New York Public Library, where my friend Mr. Nichols holds these rare volumes under lock and key. They were collected by Paul Leicester Ford, Worthington C. Ford and their father; and I am informed that the work which the father began and the two sons continued is to bear fruit in a volume by a sister of these two younger men, and this work will contain as accurate an account as is humanly possible of the evolution of this noted book. Until her work appears I speak with some care as to exact editions. But I have seen and examined all of the books in this notable collection, and my knowledge is sufficiently exact for purposes of this article.



Reproduction of a print in 'Leslie's Weekly' of 1881, depicting General O'Hara (right) in behalf of Lord Cornwallis, surrendering the army to General Washington, 1781.

Right—*General Washington firing the first gun in the bombardment of the British defences prior to the surrender of the enemy at Yorktown in 1781.*

It was about the sixth edition, i 1805, that first related the story George Washington's childhood. Th earlier ones had begun with his ex perience in the French and India War. It was this edition that wi nessed the emergence of the work fro the pamphlet to the book stage. I this form the work ran through it more than thirty subsequent edition The author of this work was Reveren Mason L. Weems, who at one tim served as rector of Pohick Churc which Washington attended. Weem knew Washington and dedicated h book to 'Lady Washington.' Gener Richard Henry Lee and other friend of Washington gave his work a some what guarded commendation.

Judged from the standpoint critical biography, it is a poor enoug piece of work. It is eulogy, apotheosi not critical biography. But it does no deserve the cheap scorn of the historia or the brayed contempt of the moder after-dinner speaker, neither of whom apparently, take th trouble to read it.

Mason L. Weem was a jolly, fiddlin parson, who peddle books and delivere lurid warning against drink an adultery. He was regularly ordaine Episcopal ministe but in the first ed tions of his work h was more careful t display on the titl page his membershi in Kilmarnock Ma sonic Lodge than h standing in th church.

But while he wa a tavern-fiddler h was not a dissipate man, and while h was not a man deep piety, his cha acter, so far as I a aware, has not been successfully a tacked. Bishop Meade in his *O Virginia Churches*, influenced in par as has been suggested, by the fact tha Weems was as willing to preach i churches of other denominations as h was in his own, has questioned th regularity of Weems' ordination, bu this I believe has been investigate and his standing in the ministry ha been found regular. (*Continued on page 2*

MR. FORD'S PAGE

OF THE DEARBORN INDEPENDENT

KILLING a man is the most useless thing that can be done with him. That is the attitude of this Page toward the proposal to restore capital punishment. To stop killing by killing is not to stop it at all, but only to multiply it. Justice is not established by killing the murderer; it is force that is thus established. There is, however, an approximation of justice in compelling him for the rest of his life to take up as far as he can the responsibilities of the one he killed—to labor for the support of his victim's dependents, if any, or to mend as far as discipline and labor can mend it the rent which his lawless deed has torn in the fabric of society.

It does no good to the criminal to kill him, and it does no good to society. A society that turns to rope or gas or electric chair to solve its problems is simply dodging them. Society cannot get rid of its mistakes by killing them. It cannot get rid of the conditions that produce criminals by snuffing out the products of that system. 'A life for a life' is an excellent rule, but it does not mean a death for a death.

So that it is not mere sentiment or sympathy that dictates this opposition to capital punishment, but a solemn regard for society and its duty to itself. There is no criminal problem by itself; it is only one aspect of the general social problem. Social imperfection shows itself under many forms—*crime, poverty, disease, unemployment, war, vice.* And of these *crime* is the least important and the least prevalent. It is probably the least depressing too; at least one cannot fail to note that it is far more entertaining to the newspaper and theater public than any display or discussion of those greater wickednesses—*unemployment, poverty, disease and war.*

Nor is this to give quarter to crime; it is only an attempt to get the proper proportion of the facts. When public opinion is in a panic because of local occurrences, it is easy to paint crime as the greatest and most pressing problem of the times, so great and pressing as to justify the State in turning criminal itself, when the very agencies that pander to the excitement dare not, at least do not, mention the greater evils in society.

But it is always a bad thing for society to throw up its hands in the face of any of its problems and turn it over to the hangman for settlement. That is not the way to meet the problem, nor the way to find a solution. Or, if it is the way, then let us be consistent and go full length with it—let us turn the Money System over to the hangman too, and disease-creating conditions, and war-making systems, and industry-destroying conspiracies. Let them all go to the hangman and let that personage stand as society's highest discoverable method of progress.

There are, however, too many persons who will not agree that the hangman is our highest development in progressive methods. The majority are against such an idea. If any one is in doubt of this, a popular vote would soon dispel it. And a popular vote should be the only means by which, in these enlightened days, such a matter should be settled.

HERE is a straight discussion of the question, Can you cure a criminal by killing him? Can you cure wrong social conditions by killing the miserable victims thereof? Every little while some community gets into a panic because of crime conditions, and then there is a general cry for the hangman to rescue it. If the hangman is good for the victims of a system, he is good for the system itself. Of all the evils of society—unemployment, poverty, disease, vice, war—the disease we call crime is the least prevalent and the least important. Why not turn the Money System over to the hangman, as well as its unfortunate victims? Every time we take hold of these questions by the wrong handle, we postpone our discovery of the right handle.

Consider: what the State does, every citizen is responsible for. We cannot say that our State killed a man; we must say that you and I killed him. We share the moral responsibility for every condition to which we consent.

More than that: what the State considers necessary and proper to do, every citizen should stand ready to do with his own hands. We cannot always relegate to hired hands what we approve as a proper thing for the State to do. If it were known that every citizen is a potential hangman as he is a potential juror, there would be no capital punishment. The man in the street does not want to go into the killing business. He would not vote for that honor for himself. And since it so directly concerns his moral responsibility, it might be well to give him the opportunity to vote upon it before it is foisted upon him.

None of the arguments offered in favor of capital punishment is found to be provable in experience. In some places where capital punishment exists there also exists a high crime rate, and in some places where capital punishment does not exist there also exists a notable freedom from crime. On the other hand, there are countries which practise capital punishment and are famous for the general security of the citizen's life and property. And there are states where capital punishment does not exist which show a large percentage of major crimes. These facts destroy the only respectable argument for capital punishment, which is that it acts as a deterrent on the criminally minded. Crime seems to bear a relation not to capital punishment, but to economic conditions, the fiber of the population and the efficiency of local authorities. These contain the causes of crime, and these are the three elements which are most persistently neglected in all public discussions and in all public action.

We have taken hold of our problems by too many wrong handles to leave room for any more. To consent that a wrong handle be tried is simply to delay the time of finding the right handle.

OF THE DEARBORN INDEPENDENT

Free Thought and Speech

IT IS admitted that in no civilized country is freedom of speech more widely suppressed than in the United States. Suppressed, not by the laws or the police, but by the insistence of organized minorities. All kinds of political, religious, racial and organizational inhibitions exist, most of them operative through the motive of fear. Three choices are open to the man who knows what is going on: he may choose to be what is fallaciously called a 'liberal' who embraces all and sundry within the arms of a superficial philosophy that everything and everybody is good, and their little differences do not matter; he may choose to keep silent from prudential reasons, and know himself to be silenced by fear—a slave to others' prejudice, and curse himself for a coward; or he may exercise his American right of independent thinking and free speech and be called a 'nut,' or a 'bigot.'

It is not asserted here that all independent thinking is right thinking, or that all free speech is wise. But it is asserted that independent thinking is necessary to right thinking, and that there can be no wise speech that is not also free. Thinking that takes its mold and color from a propaganda of custom or of fear, speech that takes its tone from fear of what organized minorities will do in retaliation, are valueless and worse—they are active agents of deterioration in our national life.

It should be explained that the reference to retaliation is not to retaliation in kind. Such retaliation would be welcomed, and would be a cleansing influence in our national life. If free speech though unwise were met by equally free speech though equally unwise, great good would be served—much more than good is now served by a silence of punitive action without reference to the ideas expressed. A man is known in the neighborhood to hold certain ideas; perhaps he expresses them. The procedure is, not to deal with his ideas with a view to showing their fallacy but to deal with the man in punishment for holding such ideas. He may be attacked in his job, in his economic relations or obligations, in his social connections. The object is not to explode the ideas, or to change the man's mind by showing the unreasonableness of what he holds, but to punish him for presuming to use such mind as he has and for daring to avail himself of the freedom of speech which the Constitution guarantees him. Lower than this uncivilized retaliation cannot go; it holds in essence every savage excess.

Yet thoughtful persons know that such a condition brings good in its train. It is wrong, of course, but its very wrongness works for right. It works, first, for a more responsible use of thought and speech. Thought that can be deflected by organized propaganda, speech that can be silenced by fear of the kind of retaliation practised, are just what they are—they *can* be deflected, they *can* be silenced. They are weak. They are based on prejudice, not on facts or reason. What then? This very ease of defeating them works toward a more strongly based thought, a more spiritually imperious speech. Suppression is the training bars on which Freedom trains to gain its strength to overcome suppression. The very efficacy of a gag rule creates the power that defeats it. Secondly, the power that works by punitive means against independent thought and free speech, and succeeds, is thereby weakened—it is led to rely on its weakest weapon. Its weakness and ultimate doom are prophesied by its having such a weapon in its armory. Its use of that weapon dates its doom as imminent. When you see power and prejudice allied against independence of thought and freedom of speech, it is a sign of the times—a sign the evil coalition is near defeat. In this sense the seeming dominance of some influences in this country is to be welcomed. Just beyond them is a new time.

The Monks for Example

RECENT investigations into the causes of cancer have discredited the opinion that a vegetable diet is a preventive of this scourge, by actually demonstrating that the consumers of vegetables exclusively are no more immune from the disease than those who include a meat diet.

A trio of London specialists, with the coöperation of Cardinal Bourne, have studied the effects of systematic abstinence from flesh food on members of certain religious orders who followed a prescribed vegetable diet. The conclusion arrived at by the investigators is that *fatal cancer occurs in populations abstaining from flesh food* and that the contention that such populations are less liable to cancer finds no support in their work. They say that:

> No scientific value whatever attaches to assertions supported merely by the vague pseudo-statistical evidence which is customarily cited respecting the rôles of certain articles of common consumption in the genesis of cancer.

Food preservatives have long been blamed, among other agencies, as cancer producers, but the food eaten by those monks whose vital statistics were under examination is generally of a character which does not need the use of any preservative.

These researches into the causes of cancer are successful even though their immediate result seems negative. It is the progress through many negative facts that finally opens the way for discovery of the dominant positive fact which ends the search in victory.

Out of Focus

A GENTLEMAN who was in Mexico City when religious riots were supposed to be at their height returned to the United States and was eagerly questioned about them. He replied that there had been none. Surprised, his host produced files of New York and Boston newspapers showing that Mexico City, on the date in question, was the scene of frightful tumult between troops and people. The gentleman remained firm in his statement that he was frequently in all parts of the city, knew intimately the condition referred to, and that there was nothing even remotely resembling the situation which people of the United States were led to imagine from the reading of newspaper reports.

An American gentleman was in Europe and, of course, eager for American news. He sought the European newspapers eagerly, both those in foreign languages and those printed in English. He gathered from their columns that the American people had abandoned all other business to go out man shooting. His home happened to be Detroit, and in Paris he read day after day exciting stories which almost led him to believe that the entire population of the city was in battle with highwaymen and bank-robbers. On reaching home, he looked up the local newspapers of the time and was left wondering why such pains were taken to cable so much local news across the world. But he understood better than he had ever been able to do before the foreign idea that the Wild West begins at the borders of New York City.

Thousands of Americans in the Orient have wondered why respect for the white man is breaking down, but they cease to wonder after they have seen the movie films shown in the Orient. If this is America shown in the films, the tribes of the African forest are infinitely preferable. Of course it is not America, but it is all the America that huge sections of the earth ever see.

So that it seems we have to be on our guard against overzealous journalism just as we ask other nations to be on their guard against misrepresentative pictures. The newspaper is the true movie, the real giver of pictures to the mind of the multitude, and if those pictures are all out of focus, mistaken ideas are born, from which mistaken actions may flow.

Medicine or Evasion?

READING the reports of the United States Treasury for the year 1926, one is surprised to note the extent to which medicinal spirits aided to ward off epidemics in our larger cities. For example, in the states of New York and Illinois, about one-half of all the prescriptions used in the United States were written. Chicago and New York City were thus presumably saved from great loss of life through the Permit Cure for fatal maladies.

We can hardly blame the doctors or druggists alone for this. It cannot be assumed that they forced the 'medicine' down the throats of their patients. It is far more probable that the patients themselves were responsible for this consumption of spirits, and in more than one instance used this means to evade the prohibition law. And yet, someone wrote each prescription. Otherwise, the large number of prescriptions which were filled in the two states mentioned, as well as in the three next in line, Pennsylvania, California and Massachusetts, could not have been made.

The difficulties Uncle Sam has met with in trying to enforce the prohibition law might be lessened materially if a few side issues, such as medicinal permits, were more carefully controlled. The Treasury Department has enough to do without safeguarding the public health.

A Fall Upward

'WE ARE likely at any time to go tumbling straight back to fundamentals.'

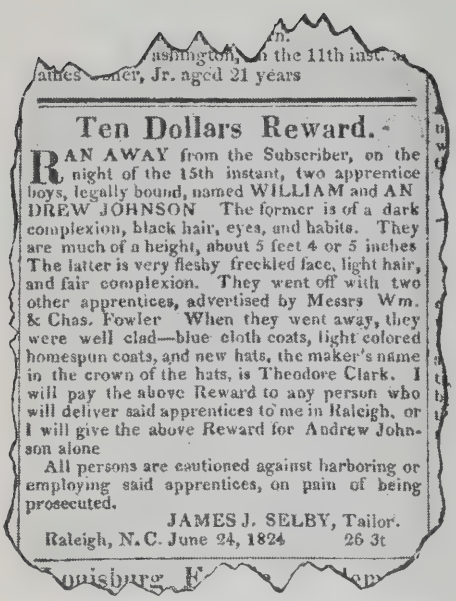
This is an arresting statement by Dr. Clarence Cook Little, President of the University of Michigan, a man whose academic relationships have not severed his vital connection with the growing life of his time. He was speaking to farmers. He thinks that the farmers are very close to the fundamentals. They have hardships, he says, but he more boldly asserts that he hopes they will never be entirely without hardships, because that is an indispensable condition of raising men. We might add to what Dr. Little said, that we still look to the farm for men. *Who's Who* is filled with men from the farm. The mass of college men today will find themselves bossed in the future by men from the 'back forty.'

But the statement that the rest of the world is 'likely at any time to go tumbling straight back to fundamentals' has a prophetic quality. There is a strange sense of expectation in the world today. Men who have tried to peer into the meaning and tendency of our times feel that they can see a new threshold looming up through the mists of the immediate future. Some great change is upon us. Another veil between our understanding and the reality of life is to be removed. Man is thrusting toward the core of things. He feels that his progress in humanity and justice has lagged behind his progress in knowledge. We have penetrated near the heart of the mystery of matter, we cause the ether to be the messenger of our voices, we master hitherto invincible foes of health, but in the daily affairs of men, in the establishment of economic freedom, we have progressed hardly at all; and all because a barrier of self-interest has prevented men from walking straight into the heart of the problem and working from that outward.

It is in that region of experience that change may be expected. Leaders and followers, managers and men are all feeling it. They are asking, How long can it go on? They are invaded by foreboding and fears. More men than are likely to be vocal on the subject will feel an answering movement of the mind to Dr. Little's statement—

'We are likely at any time to go tumbling straight back to fundamentals.'

When a Reward Was Offered for the Capture of A Future President of the United States



...ashington, on the 11th inst. a... James ...ler, Jr. aged 21 years

Ten Dollars Reward.

RAN AWAY from the Subscriber, on the night of the 15th instant, two apprentice boys, legally bound, named WILLIAM and ANDREW JOHNSON The former is of a dark complexion, black hair, eyes, and habits. They are much of a height, about 5 feet 4 or 5 inches The latter is very fleshy freckled face, light hair, and fair complexion. They went off with two other apprentices, advertised by Messrs Wm. & Chas. Fowler When they went away, they were well clad—blue cloth coats, light colored homespun coats, and new hats, the maker's name in the crown of the hats, is Theodore Clark. I will pay the above Reward to any person who will deliver said apprentices to me in Raleigh, or I will give the above Reward for Andrew Johnson alone

All persons are cautioned against harboring or employing said apprentices, on pain of being prosecuted.

JAMES J. SELBY, Tailor.
Raleigh, N. C. June 24, 1824 26 3t

...nisburg F... ...ier

Facsimile of the notice inserted in a newspaper when Andrew Johnson ran away.

By J. G. de ROULHAC HAMILTON

PART I

FIFTY years ago there passed from the American scene one of the most remarkable figures in the history of this country. Born in poverty and utter obscurity, denied every opportunity of early education, he rose by sheer ability and untiring determination, step by step, filling offices of greater and greater importance until finally he attained the highest of all—the Presidency of the United States.

His administration was one of bitter storm, and as a result he holds the additional and normally doubtful distinction of being the only President against whom articles of impeachment were brought—an indictment upon which he was acquitted by a margin of one vote, a margin, however, more narrow in appearance than in reality. Impeachment of high crimes and misdemeanors might be expected to carry with it disgrace, even if accompanied by acquittal, but such were the circumstances of this that it increased rather than lessened his later reputation. And as the years have passed, and political passions have cooled, Andrew Johnson has slowly but surely found a large measure of vindication.

Fortune, indeed, did not attend his birth. Born December 29, 1808, he was the son of Jacob Johnson of Raleigh, North Carolina, whose rise in life had been so little that tavern hostler, sexton, and porter of the state bank represented the extreme height of his worldly position. And yet, humble as this station was—far more humble than it would have been elsewhere than in a slave state—he made an impress upon his community. He was a captain of the city watch. He had friends in every walk of life, who liked him because of his stanch character, his devotion to whatever task he undertook, and his sunny, human friendliness. He never knew what it meant to have an enemy.

When the boy was born, the wife of the tavern keeper, so it is said upon somewhat doubtful evidence, suggested that he be named Andrew Jackson. The father disliked long names but accepted Andrew.

When Andrew was four years old his father died, as a result of overexertion in saving two men from drowning. His family was left in complete poverty, and the boy learned, all too soon, to work for a living. He received no education, and as soon as he was old enough to learn a trade he was bound out, apprenticed to James J. Selby, a tailor, to whom his older brother, William, was already bound. Here he began to learn the trade which he followed until public service left him no time for it. The boy was full of life, a harum-scarum youngster.

At seventeen, with a companion he 'chunked' the house of a lady who had objected to their association with her two pretty daughters, and was detected. Andrew saw in this a proper occasion to leave, and, with his brother, ran away. Setting out westward, he walked on the first day the twenty-eight miles which separated Raleigh from Chapel Hill, the seat of the state university. In the little village a kindly old couple gave him supper, bed, and breakfast, and the following day he resumed his journey. The very next time he saw Chapel Hill was forty-four years later when, as President of the United States, he attended commencement.

From Chapel Hill he went down into South Carolina, and, finding work at Laurens Court House, he remained there two years. Here according to current rumor he had a love affair which, hopeless from the beginning on account of the difference in his station and that of the lady in the case, served mightily to stimulate his ambition. In consequence he returned to make his peace with Mr. Selby, who had advertised a reward for his capture. He found that Mr. Selby had retired and left Raleigh. When Andy walked to Mr. Selby's new home twenty miles away, he readily got a release from the apprenticeship.

ANDY, as he was generally called, now determined to go to the West where a less rigid social and economic caste system would give him a chance to rise. Few men have ever set out to seek fortune and have won it with less equipment. Of education he had little. He could not write, but thanks to the kindness of William Hill, the secretary

Andrew took with him as he set off to the West his mother and his stepfather. A wagon drawn by a blind pony carried their few possessions.

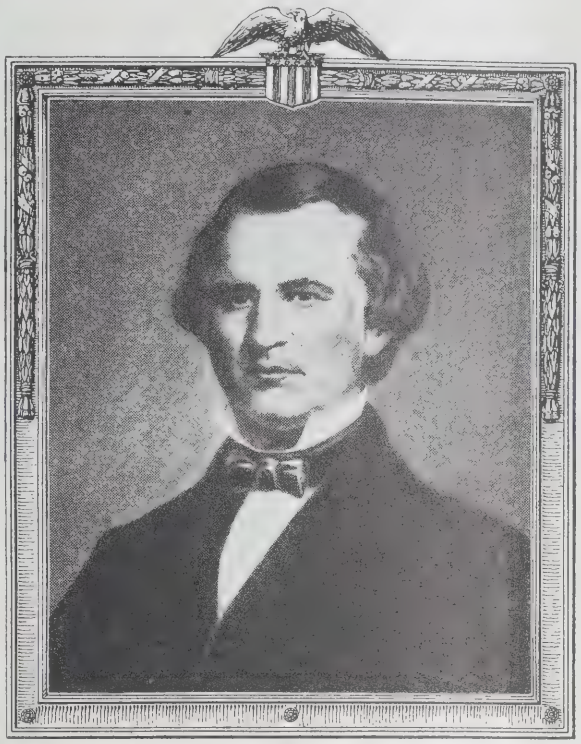
of state of North Carolina, and to his own ambition, he could read. Mr. Hill was in the habit of going to Mr. Selby's shop and reading to the men at work from *The American Speaker: A Selection of Popular Parliamentary and Forensic Eloquence.*

Andy was so carried away by what he heard that he determined to learn to read for himself. With the aid of some of his fellow-workmen he learned his letters, then progressed to simple reading, and finally proudly asked Mr. Hill to lend him the book. The latter, highly pleased, presented him with it, and here was formed Andrew Johnson's taste in literature and political speaking. As an offset to his lack of education, then, the young fellow had a passion for knowledge and an ambition to rise.

He took with him as he set off to the West his mother and his stepfather. A wagon drawn by a blind pony carried them, and their few possessions. As for Andrew himself, 'a tailor's kit, his thimbles, and his needles were probably the sum total of his possessions.' In September, 1826, the little party reached Greeneville, Tennessee, and here it was decided to stop. A little log cabin twelve feet square was rented for a shop. Andrew had found a home.

Andrew Johnson never forgot his lowly origin and rarely made a speech in which he did not allude to it, usually proudly and always somewhat defensively.

The new tailor shop was welcomed. Work came in and before long furnished a good living. Within a year he married Eliza McCardle, the daughter of a Scottish shoemaker, a woman of great beauty, fine native intellect, and splendid character, who proved to be for the rest of his life his greatest blessing. She had considerable education and she not only taught him to write, but directed his reading and studies generally. She would sit in his shop and read to him the history and biography for which he was mentally ravenous, and always she kept alive and stimulated the ambition which was to carry him so far forward. It is interesting to recall that their marriage ceremony was performed by Squire Mordecai Lincoln, a near relative of Abraham Lincoln.



While Johnson kept busy at his trade, his mind was busy in other directions. Hearing that there was a debating society at a school some miles away, he obtained permission to join it and attended the meetings regularly. Later he organized one in Greeneville. His shop by now was a center for political discussion among the plain, laboring men of the town. Johnson, sitting cross-legged on his bench and plying his needle, was the moving spirit of the group and in time he became its leader and oracle. And this group without his knowledge started him on the road to political fortune.

Prosperity came. He had to employ a number of assistants. He settled his mother and her husband on a farm in the country near Greeneville, and he bought a home. In 1831 he built the best house in Greeneville. Four children were born to him and he found infinite joy in smoothing their way and giving them educational advantages.

Prosperity did not serve to separate him from the friends he had made in poverty. From first to last he was the advocate and representative of his class and was always at home with the plain people. Most self-made men who have risen high politically in the United States have owed their advancement to the favor of the landed interests, to law, or to military glory.

Johnson had none of these to help him on. He is in this respect in striking contrast to Jackson and Lincoln, who also came from obscurity to the Presidency. Both of them left the class from which they had sprung.

His political training began soon. In 1828 he was, without being a candidate, chosen an alderman of the town, and in 1830, mayor, serving in the latter capacity for three years. From 1835 to 1839 he was a member of the lower house of the Tennessee legislature. In 1840 he 'stumped' a large part of the state, winning many friends and gaining considerable reputation as a speaker. In 1841 he was sent to the state senate and in 1843 to the national House of Representatives, where he remained for ten years. In 1843 he definitely gave up his tailor shop.

In 1853 his district was 'gerrymandered' to prevent his election to Congress. Instead of retiring from politics, he ran for governor, and in spite of the violent opposition of conservative and aristocratic interests, was elected. He was reëlected in 1855 for a second term.

These two campaigns gave him a taste of what political storms might be. He was savagely attacked by his opponents and in retaliation he turned upon them with such vigor and plain speaking that before long he was the aggressor and they were on the defensive. Presently they began to send challenges to duels (*Continued on page 24*)

The Future of the TANK

By GEORGE H. RAREY
Captain U. S. Infantry Tank Corps

PART I

French tanks bought by the American Army. They carried two men, machine guns and one-pounders, and weighed 15,000 pounds.

THE excellent record made by tanks during the World War was such as to insure for this weapon a remarkable development. Making its first appearance on the Western front during the Battle of the Somme, on September 15, 1916, the tank had to fight its way to official approval and support through many difficulties.

Tanks were brought forth as a result of a definite need and their arrival upon the Western front was so opportune that one is reminded of another armored weapon which made its appearance in an earlier war, the *Monitor*, with its revolving turrets and guns, the forerunner of our armored battleships of today, just as the crude but quite effective tanks produced by the British in 1916 were the forerunners of our future fleets of fast land cruisers. The advent of the *Monitor* headed a revolution in naval warfare and the tank bids fair to accomplish an almost equal change in land warfare.

—Press Illustrating Service.
Tank temporarily hung up in a trench on the British Western front in France.

Throughout the history of warfare all armies have endeavored to find or devise some means whereby they could 'strike without being struck.' From the days when the fighting man carried a shield, down to the present day, the object has been to strike at the enemy with some degree of safety to the attacker and thus secure as cheap a victory as possible. This idea of security in action has followed two general lines: to strike from a distance, and to get among the enemy, with some degree of safety to the attacking force. As a result of this idea, we find in history accounts of many types of war chariots, war carts, battle cars, land ships and battle tractors and we learn that many people have in the past had the 'tank idea.' However, the present tank is the first battle car that actually worked.

The main problem of the World War was how to make an advance against the most effective defensive methods ever used in warfare. Methods of defense were perfected during the early stages of the war until it had become impossible for the offense to overcome them without ghastly and almost prohibitive losses.

Germany introduced gas as a weapon designed to overcome the methods of defense, but partly due to the lack of confidence in gas as an offensive weapon, on the part of those who believed that masses of men would win and partly due to impatience on the part of the gas-weapon advocates, it was tried too soon, with the result that before Germany could make gas really effective, the Allies produced and used the new weapon, checkmating Germany at her own game.

The opposing armies again settled down to the struggle, each against the other's highly developed methods of defense—machine guns, barbed wire, great trench systems, artillery in great quantities, high-explosive shells, smoke shells, mortars and grenades, to all of which gas had now been added.

It was, however, the use of machine guns in great quantities together with the barbed-wire obstacles which presented the most serious problem to the Allies and caused them to seek a weapon capable of overcoming these devices.

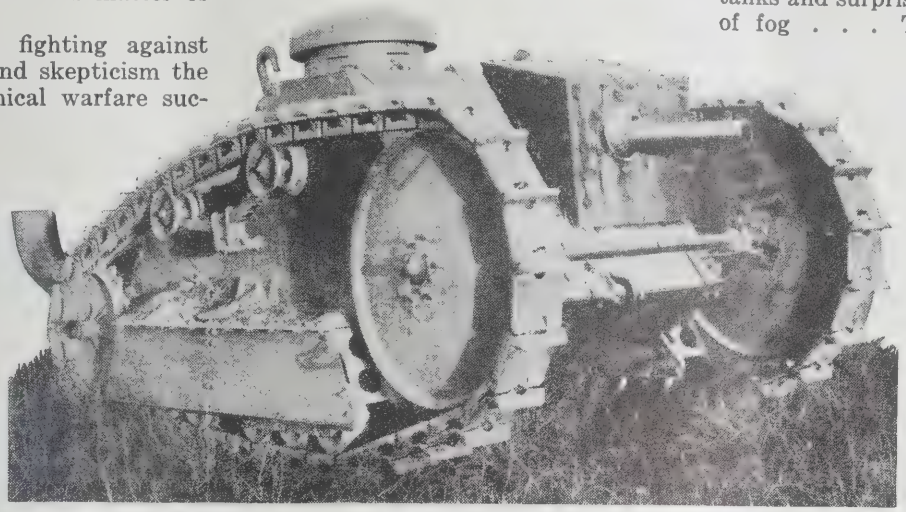
There were three solutions to this problem: the expenditure of thousands of lives and millions of dollars to make an advance; the use of great quantities of artillery and ammunition, over a long period of time, to blast away the enemy wire and defense system before an advance; or the use of armored vehicles capable of crushing the wire obstacles and machine-gun nests, and neutralizing pill boxes or blockhouses and other strong points.

That the first alternative was given

a fair trial, the acres of white crosses in France bear silent witness. That the continued use of the second alternative, on a scale equal to the usual practice on the Western front during the last two years of the war, would have seriously depleted the resources of the wealthiest nation, is evident.

That the third alternative was *the answer* to the problem is a matter of history.

After months of fighting against official indifference and skepticism the advocates of mechanical warfare succeeded in having a few of the first type of tanks built and shipped to France. From September 15, 1916, until the close of the war, tanks were used in action under all possible conditions, and, although severely handicapped during a considerable part of this time, on account of the ignorance of all concerned regarding the proper method of using the new weapon and owing to many mechanical defects, the war lasted long enough to enable the Tank Corps of the British, French, and American armies to experiment with their machines, and thus gain much valuable information concerning them during the acid test of service in battle.



—Keystone View.

American three-ton, or 'Baby' tanks, very speedy on the field of action.

Six or seven types of tanks were tested upon almost every conceivable kind of terrain, the muddy swamps of Flanders where their value was at a minimum; the rolling, chalky ground at Cambrai; the wooded Meuse-Argonne; and the desert wastes of Palestine.

The net result of the Allies' twenty-six months of tank experience was to prove to even the most skeptical that the tank was a first-class offensive weapon.

When properly used it was a great life-saver, in that it made possible the taking of enemy positions at a great reduction in casualties among the attacking troops.

When used to destroy enemy wire entanglements it performed the service quicker, easier and at far less cost than the old method of tearing down the wire by shell fire.

Due to its mobility, fire power, and protection, it was the best weapon to use against machine-gun nests.

With the aid of tanks in sufficient quantities, fighting in the open was again possible, while without them, no relief from the detested trench warfare was in sight.

When properly used, the tank was a real morale builder for the infantry who were fortunate enough to have tank support; while its effect upon enemy troops was such that thousands of them surrendered upon the approach of the tanks.

In his report upon the operations of the First Army during the Meuse-Argonne offensive, General Pershing said: 'The terrain just beyond no-man's-land was ill adapted to the employment of the limited number of tanks (189) at our disposal, particularly the small type we were compelled to use, and most of our infantry was without experience in coöperating with them. Nevertheless, the tanks rendered effective assistance during the early period of the battle, particularly on the 26th and 27th, but casualties, mechanical troubles, and the relief of French units reduced their number to eighteen by the end of the first ten days. *An adequate supply of tanks*, such as were being used by the French and British at this time, *would have materially quickened our advance* and *reduced the number of casualties suffered by our infantry in penetrating the thickets of machine-gun nests.*'

The writer has italicized certain portions of these statements for the purpose of emphasizing those parts which are most important *now*.

What was the opinion of the enemy?

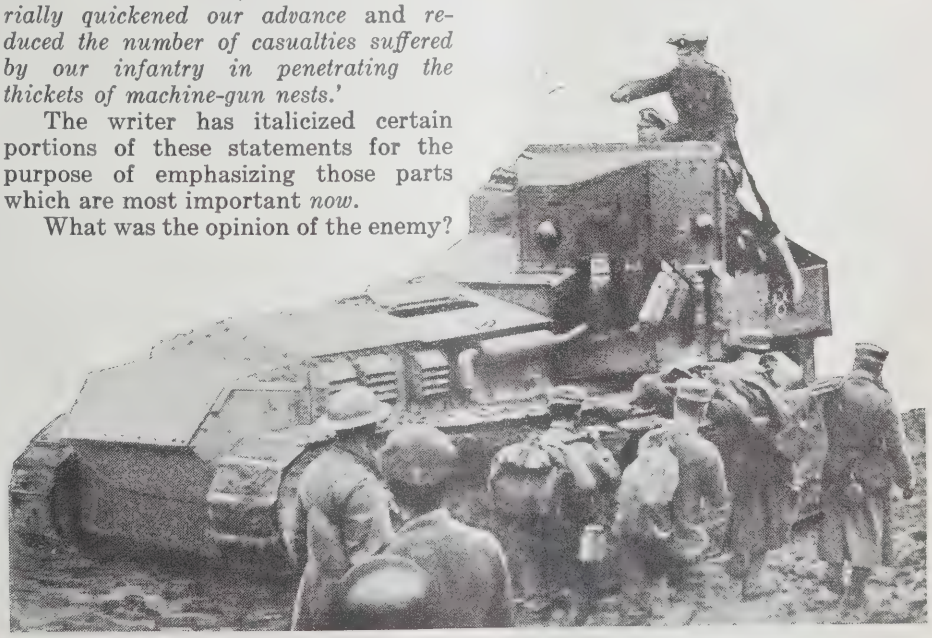
The views of the German Minister of War were expressed by General Wrisberg, in the Reichstag, as follows: 'The attack on August 8th between the Avre and Ancre was not unexpected by our leaders. When, nevertheless, the English succeeded in achieving a great success, the reasons are to be sought in the massed employment of tanks and surprise under the protection of fog . . . The American armies should not terrify us . . . More momentous for us is the question of tanks.'

General von Zwehl stated: 'I am of the opinion that it was not the genius of Marshal Foch that defeated us, but "General Tank," the new engine of war, in conjunction with the extensive American support.'

Of one thing we may be quite sure: the tank is a weapon we will have to deal with in a war with any of the leading powers. Whether the next war is to be one of position or of movement, tanks will be of great value to the army which has them *in sufficient quantities when they are needed.*

That the nations consider the tank an excellent weapon is shown by the great increase in speed of those built since the war. These modern tanks have low speeds, of course, for use when the machine supports an infantry advance; high speeds are provided for other contingencies.

(*To be continued in an early issue*)



British Medium Mark A tank, or 'Whippet,' has a speed of 8.3 miles an hour.

PART I

The Adventure of the

By HUGH WALPOLE

YOUNG CHIPPET and I had many funny times together. Out of many adventures that we had I have chosen this affair that I have called 'The Adventure of the Imaginative Child' because of the strange figure who is its center. I cannot hope to give any satisfactory explanation of John Borstal Clay. I am only stating the case as I saw it. There is, perhaps, no explanation of anybody in this strange and casual world. I sometimes think that the Potter simply throws odd pieces of material together and then lets come out of it what will. It takes more than Dr. Freud to explain John Borstal Clay.

One day in the middle of spring, when the trees were budding and the very streets humming their pleasure under the April sun, a Mr. Fortescue Bumpus paid me a call. I had had so many strange visitors within the last few weeks that it was rather comforting to see anybody so completely normal as Mr. Bumpus. He was one of those little men who wear their clothes like armor, who are so cleanly shaven, save for a little neat mustache, that their cheeks gleam like billiard balls, who are right and tight in their person, upon whose bodies there is no speck of dust, and upon whose souls there is no sign of any abnormal curiosities.

MR. BUMPUS, it was plain to see, was a man entirely without imagination, fifty-odd years or so, kind in the English fashion, making, one must suppose, a satisfactory income, having ten minutes' Muller exercise in his bedroom of a morning before the open window, abusing gently each day at breakfast the socialistic tendencies of the Labor Party, calling, in all probability, his wife 'mother,' and arranging what he was going to do with himself and his family on Bank Holiday months and months before the event. Mr. Bumpus, in fact, is what is known as the backbone of England. It was all the more deplorable, therefore, to see that he was in a state of very considerable distress. When something distresses a man of Mr. Bumpus' type, he is like a lost dog with a tin can tied to his tail. He has no idea where to go, to whom to speak—above all, he has no one in the world with whom he can be intimate. With his wife he has lived so long and so complacently that possible intimacy between them lies buried deep 'neath layers of domestic dust. The friends of his own sex are only on billiard, golf, or drinking terms, and his children he probably approaches in alternate gusts of anger and sentimentality, boxing their ears one day and giving them too many chocolates the other. He knows, deep, deep down, that the world is a rum place, but it is his natural tradition to set up around himself a kind of Crystal Palace hung with dark green blinds, and to sit inside it, and although he may feel the warmth of the sun beating upon the glass and sometimes hear torrents of rain like thunder on the roof, he cheats himself into believing that there is no world outside, or that, if there is, like Noah in his Ark, he has been forbidden to encounter it.

All this long explanation is necessary for my story.

Chippet was just then away, engaged upon some affair of his own. My friend Borden and I consoled Mr. Bumpus to the best of our abilities. He sat down, pulling his trousers a little above his knees, laying his plump hands upon them, and looking forward at us with a pathetic eagerness, rather as an infant bird in the nest opens its beak for an expected worm.

Illustrated by
AUSTIN EUGENE BRIGGS

'You're very young, gentlemen,' was the first thing he said.

'We are not so young as we look,' I replied smiling at him encouragingly. 'At any rate, tell us what we can do for you, Mr. Bumpus, and if it's beyond our youth, you can be sure of our discretion, and we will not, of course, charge you a penny.'

OH, THAT'S all right, that's all right,' he answered nervously, 'that's really quite all right. Lovely weather today, isn't it?'

'Spring,' said Borden very solemnly, 'is upon us. It is the period of the year when youth is at its best. We take your coming to us on such a spring-like day as the best of omens.'

'Yes, yes, quite so,' said Mr. Bumpus, gazing desperately around the room, suffering all the agonizing terror of one who must speak of intimate matters to a couple of strangers to whom he has really never been properly introduced.

'It was a Mrs. Fleming,' he began at last, 'who recommended me to ask your advice. She told me that a fe months ago you helped her in a seriou domestic difficulty. It is a domesti difficulty of my own about which have come to speak to you, but reall you are so young—' He broke off an ended with a rather foolish smile 'I might be your father, you see.'

I saw that this was the moment t exert our authority. 'Excuse me fo speaking plainly, Mr. Bumpus,' I re plied, 'physical age has nothing to d with this matter at all. We may b able to help you or we may not. Te us your trouble, and we will see wha we can do.'

'Well, it seems so foolish,' said M Bumpus, 'to come to anybody abou such a matter as this, but Mother i nearly distracted. She loves he children, gentlemen, with a devotion have never seen equaled elsewhere Mrs. Bumpus is one in a million.'

'Is it about your children that yo wish us to help you?' I asked.

'In a way, yes,' he answered nerv ously, and then, taking courage ap parently from Borden's muscular an thoroughly British appearance, h plunged straight in.

'Some three years ago a brother mine, who lived in South Africa, wa killed with his wife in a railway acc

IMAGINATIVE CHILD

Copyright, by HUGH WALPOLE

dent. He was my favorite brother, and left an only child. This was a boy, then nine years of age and now twelve. My brother, in his will, as though he had a premonition that something might happen to him, left the boy to us in case of any disaster, with a very handsome sum of money for his upbringing. Mrs. Bumpus and I were proud and delighted to assume solemn charge. The boy arrived just three years ago this very month, and became, of course, as one of our own. It is about this boy that I wish to consult you.'

'The boy is extraordinarily old for his age, and he knows much more about all of us than any boy has a right to know.'

He coughed, looked at us piteously as though he were begging us to tell him that no further information was needed. That, of course, we were unable to do, and we could only look at him with an intelligent and kindly interest.

'The boy's name,' he continued, 'is John Borstal Clay.' He repeated these words over again as a sort of solemn incantation. 'He was a bright little fellow, nice-looking, intelligent, and amusing. We sent him to Dulwich School.' He paused, then, leaning forward toward us, repeated with the greatest solemnity: 'That boy, gentlemen, is wrecking our beautiful home life.'

'Dear me,' Borden remarked, 'so young a boy and so wicked?'

'Not wicked,' said Mr. Bumpus hurriedly. 'I don't want to say a word against the child.'

'You must tell us the truth, Mr. Bumpus,' I said. 'We cannot possibly help you unless you tell us everything.'

'But it is just that,' said Mr. Bumpus, 'that it is so difficult to tell. The boy's not a wicked boy—at least, not in the accepted term of wickedness—he doesn't steal nor tell lies.' Then again, with the utmost solemnity: 'He is not a real boy, gentlemen, at all. Not like any other boy in the whole world. We are afraid of him—all of us—and when you've seen him you will know why.'

This was very interesting, and I saw Borden, who likes boys and thoroughly understands them, lean forward and watch Mr. Bumpus with renewed interest. 'Would you mind telling us,' he asked, 'about the rest of the family? How many children have you?'

'Three,' said Mr. Bumpus, 'Emmeline, Gertrude, and little Percival.'

'What ages are they?' asked Borden.

'Emmeline is thirteen and a half, Gertrude is twelve, and Percival eight.'

'And are they also in terror of your nephew?'

'They are indeed,' said Mr. Bumpus. 'And yet it is hard to say why they are. If it were simply a case of John's being unkind to them or ill-treating them, it would be comparatively simple. You see, gentlemen, I loved my brother

John was not present, but the three Bumpus children were all there. They presented a very happy, domestic picture.

dearly, and what Mrs. Bumpus and I wish, above all things is to be just.'

'If the boy is upsetting your family,' said Borden, 'why don't you send him to a boarding school?'

'We did, sir,' said Mr. Bumpus. 'He went to Rugby for a term, but we were almost more uncomfortable when he was away from us than we were when he was with us. What we want,' he cried, 'is for John's attention to be directed toward somebody else. We shall have no peace until he loses interest in us. That is where I want your help.'

'Loses interest in you?' asked Borden. 'That's a strange phrase to use about a small boy of twelve.'

'I know it is,' repeated Mr. Bumpus, almost in agony, 'but when you see the boy, you will understand what I mean. He is extraordinarily old for his age, and he knows much more about all of us than any boy has a right to know. He is not a wholesome boy.'

'Do you mean that he is a nasty-minded boy?' asked Borden. 'Does he tell your children nasty stories and put wrong ideas into their heads?'

'No, not in the accepted way,' said Mr. Bumpus, 'and yet he does tell them stories, too. But no, I can't explain what I mean. You must come and see him for yourself.'

'Then what you want us to do,' I summed up, 'is to turn this boy's attention from yourselves into some other channel?'

'That's it,' said Mr. Bumpus. 'Oh, if you only would, how happy and grateful we'd all be!'

The conversation ended in our making an agreement with Mr. Bumpus on our usual terms, namely, that if we were successful he should pay us a certain sum, and if we failed, only half that sum.

The very next day I took tea with the Bumpus family. They lived in West Kensington, and their house was as right and tight as little Mr. Bumpus himself. Mrs. Bumpus was a charming, stout, friendly woman, considerably older, I should imagine, than her husband, with hair turning gray, rosy cheeks, and a voice like a kettle on the hob.

John was not present when I arrived, but the three Bumpus children were all there. They were the quietest, demurest children you ever saw. Emmeline and Gertrude would be stout and rosy-faced like their mother. Little Percival was in a velvet Fauntleroy suit, and was doing something with a set of bricks in a corner of the drawing-room. They presented a very happy, domestic picture, all of them talking in low tones, Emmeline stitching away at a small piece of cambric, Gertrude, who wore spectacles, reading a book, the clock ticking, the windows open to let in the beautiful evening sun, Mrs. Bumpus being kind and smiling at Borden and myself as though she had known us for years.

WE HAD been there, I suppose, some half hour when John came in. He came in very quietly, closing the door behind him, shook hands with us, took his place near the tea-table in the properest manner possible. He was a short, thick-set boy with a strangely foreign appearance. This arose, I think, partly from his jet-black hair, his deep black eyes, fringed with heavy dark eyelashes, and a rather sallow complexion, in which there was, nevertheless, the color of excellent health. I noticed at once his hands, which were remarkably clean for a boy of his age, with well-kept nails and thin, beautiful fingers. He moved with admirable grace, not at all with the clumsy awkwardness of a boy of his age, and yet he was a quite natural boy, not effeminate, nor mannered, nor artificial. He said very little. Borden, after a time, began to talk to him, asked him questions about his school, whether he liked football, and so on, and to all this he replied politely, completely at his ease. I soon noticed, however, that the family were all strangely disturbed at his appearance. Percival seemed to be no longer happy with his bricks, and Emmeline and Gertrude glanced nervously toward the tea-table, and an air of constraint crept into the comfort and homeliness of the scene. After a while John got up and walked very quietly over to Percival, knelt down on the carpet, and began to help him to arrange his bricks. Once or twice Mr. Bumpus glanced at us to see whether we noticed anything peculiar. Conversation halted. We ourselves felt awkward and uncomfortable. We were about to get up and go, but suddenly a wail from Percival drew all our attention.

'I don't want them that way!' he cried. 'That's a nasty way. I was building a cathedral.'

'All right,' said John quietly. 'Let's build a cathedral, then.'

'But I want to build my own cathedral,' Percival wailed. 'I don't like your cathedrals.'

'Now, now, Percy darling,' said Mrs. Bumpus, getting up and going toward him, 'it's very kind of John to help you.'

'I don't want John to help me,' said Percival, getting up and suddenly bursting into a flood of tears.

'Well, then, I won't help you,' said John smiling.

THEN, seated as he was on the floor, he looked up at Mrs. Bumpus, and that glance was the first revelation I had of what might be disturbing the tranquillity of the Bumpus family. It was the oldest glance I have ever seen a child bestow upon another human being—a strange glance to see in that young and innocent face. It seemed to say: 'Well, and what are you going to do about it? I know you better than you know yourself, and I want to see, just for my own amusement, to what lengths of folly you are likely to go.'

There may have been, of course, some imagination on my part; after events, however, were to prove to me that I was not far wrong. Percival was led from the room. John got up and came across to us. Mr. Bumpus tried to cover the uneasy effect of this little incident by saying in an unnatural, jocular tone: 'Well, my boy, and how's the work been today?'

'All right, Uncle Henry, thank you,' said John quietly. He looked at him as though he were going to say something more, then gave Borden and myself the strangest glance of amused curiosity, and left the room. No further allusion to him was made during the rest of our visit.

WE HAVE in these days the habit of discussing in learned terms and all the latest German technique the psychology of children. By this parents are influenced, and become morbidly anxious about the ethical state of their little ones; friends are perpetually bored by discoveries made by anxious mothers of the new tendencies in their darlings' little souls; the only beings entirely uninfluenced by this modern movement are the children themselves. Children form the only portion of the earth's population entirely untouched by the development of so-called civilization. Children, like their elders, are cruel, malicious, mean, treacherous, tyrannous, greedy, remorseless, selfish, but, unlike their elders, they make no sort of pretense of pretending that these unpleasant emotions are anything but what they are. Ask a cherub of twelve and a half what during last term he did to another cherub aged nine and a half, and if he discovers that you are to be trusted, he will show you that the head-hunters of Tsavo are not in it with him for the frank indulgence of cheerful cruelty. But, more than that, small boys live so entirely in a world of their own that we cannot begin to realize what they are really doing and thinking unless we become small boys ourselves, and we do not become small boys by sitting neatly dressed in amiable drawing-rooms and talking in dulcet tones to charming old aunts, but rather by going out boldly into the boy world, stealing all we can see, eating everything we can lay hands upon, being as cruel as possible to everybody weaker than ourselves, and allowing ourselves to be torn into very small pieces rather than betray a fragment of the truth about some friend whose possession we would instantly lay hold upon had we a moment's opportunity. There are some men and a few women who are often praised for 'never growing up'; these remain among the nastiest and most dangerous of their kind. On the other hand, there are some boys who grow up at once and are a great deal older than their elders. It was at first this that I supposed had happened to John Borstal Clay. 'He's simply,' I told myself, 'been living with grown-up people and is old before his time. The Bumpuses, on the other hand, are younger than they've any right to be, simply because they allowed their imagination to die a natural death, and have developed such a strain of English prudery that they are quite incapable of seeing what's in front of their noses.'

FOR a week or two this explanation sufficed me. Borden and I, in the arrogance of our young hearts, agreed that it would be very easy to detach the youthful John's mind from the Bumpus family and to fix it upon something or someone else, even, if need be, upon ourselves. I suppose that there's no one in the world who dislikes boys of John's age more thoroughly than I do myself, but John was an exception. He had none of the noisy, greedy, unattractive habits of his kind. He did not interrupt his elders when they had just reached what they considered the earth-compelling portion of their narrative. He did not beg for food that would, he knew, be denied him unless he made a terrible noise. He was not uncleanly in ways that I need not more minutely define, and he watched life with a curiosity that was quite astonishing. It was this last quality in him that gradually absorbed my attention. Nothing seemed to escape him. I soon saw that there was no foolishness nor weakness in the Bumpus family that he had not observed, and from that I began to see why it was they were so anxious to be rid of him. We can support with comparative ease those friends of ours who realize only the weaknesses that we have not got, but so soon as anyone puts his finger upon even the tiniest of our real faults, we begin to dislike him and think that we had better have somebody kinder in his place.

John knew perfectly well that Emmeline was cultivating, as fast as she could, all the domestic virtues because she was lazy, and found that those same virtues brought in the quickest and most tangible rewards. She lived, so to speak, for aunts, uncles, cousins, and elderly friends. She ran messages, spoke in sweet tones, and loved to group herself at the feet of some short-sighted relative and lay her head against that relative's knee and look ecstatically comfortable. John knew that she was not comfortable, and if that particular relation did not speedily produce something in the way of a gift or an invitation, Emmeline grouped herself elsewhere.

Gertrude, on the other hand, was all for estheticism. What she wanted to be was strange and peculiar, so that people coming to tea said to Mrs. Bumpus: 'That's an original child you've got there; she should do something when she grows up.' So Gertrude was learning the piano in a quite excruciating fashion, was ready to recite *We Are Seven* and *The Wreck of the Hesperus* on the slightest invitation, and very often on no invitation at all, and loved to sit on a small stool in the very middle of the drawing-room floor, staring in front of her, gazing into nothing. Little Percival was the only one of the family who pursued his gentle way without artificiality, but in his case you could not but wish for a little affectation, his natural habits, manners, and customs being of the noisiest, most provocative kind. Mrs. Bumpus was a sweet woman, with the intelligence of a very kind sheep. She just managed to get through the duties of the day without any actual disaster. These duties left her but little time for the development of her brain; she liked novels and read, on an average, one new one a day. She had never the slightest idea of the names of the authors of these novels, and had been known to read the same book three days after an earlier perusal without the slightest notion that she had ever met it before. She was, however, a very good woman, being far too stupid to be anything else. Mr. Bumpus adored her, not so much because she was good or sweet or kind, but because she was so stupid that he had no fear of anyone thinking her cleverer than himself.

Emmeline loved to group herself near some shortsighted relative and look ecstatically comfortable. John knew that she was not.

Now, all these things John perfectly knew, and I soon perceived that he played with these qualities and defects, not apparently with any malicious intent, but only

'It really is most uncomfortable, feeling that a boy of his age is watching you all the time, and regards you rather like animals in the Zoo,' said Mr. Bumpus.

because he was so anxious to see what, in the circumstances, they would do. He would, for instance, ask Mrs. Bumpus very quietly where she thought Uruguay was. She would probably say hurriedly: 'Why, in Africa, dear.' He would say, 'Thank you,' very quietly, and then, days later, when relations and friends were gathered together, he would remark, still more quietly: 'Uruguay isn't in Africa, auntie—I looked it up in my atlas.' Mrs. Bumpus was always terribly upset at any exposure of non-intelligence, it being her theory, studiously developed through many years, that she knew just as much about anything as a good woman had any right to know. Mr. Bumpus also was distressed, and would look at her with surprise, saying: 'Why, surely, mother, you didn't say that Uruguay was in Africa, did you?' She would then be all in a flutter, and her eyes would fill with those large, warm tears that seemed to contain some composition of grease in them, so heavy and thick and slow were they.

With Emmeline, John had a glorious time, taking pleasure, but not a malicious pleasure, in betraying her to aunts and uncles and any others likely to be too easily captivated.

When Emmeline was nicely seated upon a cushion on the floor, her flaxen head resting against a bony knee, uttering in a soft dreamy voice, 'And now, auntie, please tell me what you were like as a little girl,' John would look at her with such a curious, inquisitive smile that the aunt, too, would wonder whether all were well, and instead of the natural impulse to burst into sentimental reminiscence there would come forth a rather snappy: 'Not now, child. After all, there can be very little about my youth that anyone would want to know.' Also, when John was alone with Emmeline, he would say softly: 'Emmy, Uncle Henry's coming tomorrow; he is good for a box of chocolates, but not more than that. I shouldn't bother about him.' And Emmeline, who cheated herself, as we all do, into believing that she invariably acted from the purest and most beautiful motives, would get one of those nasty little glimpses into reality which kind friends in a temper sometimes give us, which are, indeed, almost the only link with reality that we have.

I need not emphasize this further. It will now be seen by anybody who is interested in the Bumpuses why they wanted to get rid of John.

At the end of the first fortnight I decided that I must get to know John better, and I asked Mr. Bumpus if he would have any objection to John's coming to spend a night with me in my little house in Westminster. Mr. Bumpus was delighted. 'I do hope,' he explained, 'that you don't think that we wish to be unkind to the child; it's simply that—that—well, to put it frankly, that he upsets the tempers of my wife and the children.'

'Yes, I understand that,' I answered, 'but what is still a puzzle to me is that you tell me that he upsets you as much when he's away from you as when he's with you. That, I confess, is a mystery to me.'

'It's a mystery to me, too,' said Mr. Bumpus. 'I think it's a little this way—that we feel as though he always had us in his mind and was thinking the worst of us. Not exactly that he dislikes us, you know, but if I may put it personally, suppose I'm dressing in the morning, and lose my collar-stud and go down on my knees after it, and am, just for the moment, in the condition that—well, you know what a man's like when he loses a collar-stud.'

'I do,' I assured him.

'Well, I feel as though John had watched me, even though he's as far away as Rugby, and ten to one I get a letter from him the next day with something in it that seems to me to hint ever so slightly at that very incident. Now, you'll say that's absurd. I dare say I'm over-sensitive about John—I think we all are—but it would have astonished you to have seen the numbers of letters that John liked to write while he was at Rugby. Boys of his age don't like writing letters, you know, but he seemed to enjoy it, and every letter made one a little uncomfortable some way. Now, all we want is for him to fix his attention upon somebody else. It really is most uncomfortable, feeling that a boy of his age is watching you all the time, and regards you rather like animals in the Zoo. Mrs. Bumpus doesn't like it, and although she wouldn't say an unkind word about the boy, and, indeed, never says an unkind word about anybody, still, she isn't comfortable when he's in the house, nor, indeed, when he's out of it, and it's for her sake, more than my own, that I have asked your assistance.'

(To be concluded in an early issue.)

The Best Books Are the Cheapest

(Continued from page 6)

or editions so small that they sell for a dollar a volume or less, are the 'Little Books on Religion' (Macmillan), the Lambskin Library (Doubleday), the Lotus Library of Continental Masterpieces (Brentano's—these sell for a dollar and a quarter a volume), the Home University Library (Holt) and the 'Today and Tomorrow' series by Dutton. Besides these, in fiction, the Nelson Company makes a specialty of standard authors in cheap editions. Pocket editions of Dickens can be bought for a dollar and a quarter in single volumes.

I cannot emphasize too strongly the importance of reading in each branch of thought one or two of the source books, and this for the reason that once these source books have been read, they render superfluous a very large proportion of the books on that subject issued today which are so loudly proclaimed by the publishers as 'the latest thing.' It will be discovered that the writers of these books have obtained most of their ideas from these very source books.

As an instance, on the subject of art, if one reads the first two volumes of Ruskin's *Modern Painters*, which is published in Everyman's Library (Dutton), together with a short essay of Tolstoi's *What Is Art* he will learn from these masters more about art than if he read half a dozen late books, which may sell all the way from four dollars to ten dollars.

I am by no means depreciating the value of the late books; neither is it necessary for us to agree with either Ruskin or Tolstoi. But the fact is that these men were two of the world's greatest. Particularly is this true of Ruskin, with regard to his style. His English prose is unexampled in its simplicity and clarity. For this alone his books are worth reading.

I was deterred many years ago from reading Ruskin by the cynical observations of several friends who declared that all Ruskin was trying to do was to 'play up' Turner. That is, or may be true, but it does not detract from the value of his work.

Similarly, if you wish to know the importance of art in fiction, you must begin with Fielding, and because it is shorter I recommend the reading of his *Joseph Andrews*. Such books as Fielding's, together with Hawthorne's *Scarlet Letter*, Jane Austen's *Emma*, Thomas Hardy's *Jude*, and others, may seem rather slow and old-fashioned compared with the rapid delivery of today.

Be not deceived. Do not be overcome by the speed control. You will discover, if you care to go into it, that most of our modern literature is merely a rehash, jazzed up to suit modern palates.

The big writers depend almost entirely upon nouns and verbs to carry them through. When they use adjectives and adverbs, they use them unerringly and sparingly, taking their cue from the King James Version of the Bible. The modern, half-decadent writers, in striving for applause, try to get the crowd by striking combinations of bizarre words. That is the reason such a large proportion of modern 'epoch-making' books fall by the wayside.

The Way We Suppress Crime

(*Continued from page 4*)

breakers who are sought. The next day's bulletin tells of any cancellations. In this way no officer can plead ignorance of any cases. A work sheet of all crimes is maintained concurrently with information as to the disposition made of all such cases.

In 1925 Milwaukee had 139 fewer burglaries than in the previous year, while the record grew in other cities. In the same period there was $328,109 less loss through crime than in the previous year. Ninety-three per cent of all stolen autos were recovered, and sixty-five per cent of all general property.

It is to be expected that such an efficient police department as that of Milwaukee should have at its head a man of genuine executive ability, wide experience and a thorough knowledge of criminology and the handling of lawbreakers. Such a man is J. G. Laubenheimer, chief of the Milwaukee police department.

View of business section, Milwaukee, Wisconsin.

Here are some of his views:

'If crime thrives in any city, the police department is finally responsible. This is a most important fact for any crime-ridden city to realize. But no police department can function unless it is backed by a politically clean and well-governed city such as Milwaukee. Then if crime continues to exist the blame is upon the police department and it is certain that this branch of the city's system is not functioning properly.

'Milwaukee's enviable low record of crime is largely due to the fact that its police department seriously realizes its responsibility. As a department we feel that if crime exists within our limits it is the fault of the department. As individuals our officers feel that if lawbreaking grows in the districts under their control, the blame is personal. We have succeeded in building a genuine conscience into the department.

'This has been possible for the reason that Milwaukee's police department is divorced from politics. In many places the police department has always been considered as a political football; a handy favor-granting instrument for varying political parties in local power. Nothing is more certain than the fact that politics and police efficiency are absolutely incompatible.

'Our police headquarters is not a political clubhouse, but a business institution in which we endeavor to apply the same sound principles that must go into the making of an industry.'

'Although I believe that no cruelty should be practised on even a hardened criminal, I still feel that in most places wrongdoers are too kindly dealt with. And although the prisons are more comfortable than criminals deserve, still that is the place for them—and that is where they go promptly if they attempt to pause in Milwaukee. When any of our men encounter a well-known crook in the city he is brought at once to headquarters.

'It makes no difference whether he has "actually pulled a job" here. We assume from his presence that his intentions are doubtful. By means of a vagrancy law we are able to send him to the House of Correction for a sentence up to ninety days. And we tell him that when he gets out he is to get out of our city and stay out.

'We believe that no crook can be trusted. In this belief we vigorously impress upon the criminal class that Milwaukee is a good town—but only for honest people. Every man on our force is doing his utmost to keep this city clear of crime at all times. Our records show that we have succeeded better than have most cities, but we do not intend to stop. We have found that "eternal vigilance is the price of safety," and Milwaukeans want and shall have safety.'

Why the Anglo-Saxons *Are the* Descendants *of the* Lost Ten Tribes *of* Israel

By MARK JOHN LEVY

IT WAS on the high seas between Australia and San Francisco forty years ago last summer that I first met the late George O. Barnes, the well-known Kentucky evangelist. He believed that the Anglo-Saxon peoples are the descendants of the Lost Ten Tribes of Israel, and manifested warm friendship for me as a son of Levi whose ancestors had cleaved to the House of Judah. I had been converted mentally to the belief that Jesus is the Son of David, and the Messiah, but had been deterred from an open confession of faith because I had seen no evidence of spiritual power in the lives of Gentiles whom I had judged mistakenly to be Christians. Mr. Barnes, however, revealed a degree of love, joy and self-sacrifice in his ministry beyond anything seen among my own people, although I had previously associated with some of the most religious and philanthropic Jews in London, my native city.

A careful study of the New Testament soon convinced me that the Church had committed a great wrong against Judah since the Council of Nicea (A. D. 325) by teaching Jewish Christians that they must necessarily forsake the national and social customs of Israel to prove their faith in Him who came 'to confirm the promises made unto the fathers.' It became my purpose to counteract this error, which is the greatest stumblingblock to Jewish entrance into Christianity. Shortly after I returned to London, in 1890, where I organized the Hebrew Christian Patriotic Alliance, my attention was drawn to an article in the *Banner of Israel* wherein I was severely criticized because I would not acknowledge that the British are Judah's blood-brothers. The editor had not sought my opinion on the question and I had not given it serious consideration up to that time, but out of gratitude to Mr. Barnes I began studiously to read the evidence in its favor from the ethnological, philological, archeological and scriptural standpoints. My inquiry into the facts convinced me that the Identity of the Anglo-Saxons with the Lost Ten Tribes of Israel was established.

Scripture narrates that the Ten Tribes were taken captive to Assyria by Shalmaneser (721 B. C.) one hundred and thirty-four years before Judah was taken captive to Babylon by Nebuchadnezzar (587 B. C.) and that they never returned as a representative body to Palestine. Led by Dan, the northernmost tribe, they gradually wandered from Media, by way of the Caucasus Mountains, to the western part of Europe—Dan as a waymark stamping his name (*Judges* 18:29) on that continent; Dar-*dan*-elles, *Don*, *Dan*ube, *Dan*aric Alps, Scand*in*avia, *Den*mark, Lon*don*, and so forth, and so forth. Consonants only are arbitrary in the Hebrew language.

First from Saxony and later from Normandy, the Ten Tribes crossed to Great Britain, where they have been unconsciously fulfilling a remarkable series of prophecies concerning Ephraim and Manasseh foretold by Jacob when he blessed the two sons of Joseph, and declared that Ephraim should be 'a nation and a company of nations,' namely, Great Britain, and her self-governing colonies; and Manasseh should be 'a great people,' namely the United States. (*Gen.* 48:19) The unwisdom of applying these and other prophecies to the Jews, as representing the whole twelve-tribed house of Israel, has resulted in great spiritual confusion, and is responsible for much of the present-day so-called higher criticism of the Bible.

The Jews acknowledge that they represent only two tribes and a remnant of all tribes (*Jer.* 3:18; *Isa.* 11:10-13); and a careful reading of the fifteenth to the seventeenth verses of the thirty-seventh chapter of *Ezekiel* proves conclusively that, whereas some of all the tribes are included among the Jews, without the possibility of identification except in the case of Levi, the bulk of the Ten Tribes are still separated from Judah, and have become Gentilized nationally. But the unveiling of the prophetic word during the past century by those who have patiently searched sacred and secular histories has caused hundreds of thousands of Anglo-Saxon Christians to rejoice in the knowledge of their being naturally participants in an anciently pronounced destiny: 'Moreover, thou son of man, take one stick and write upon it, for Judah and for the children of Israel his companions; and take another stick, and write upon it, for Joseph, the stick of Ephraim, and for all the house of Israel his companions; and join them one to another in one stick.' This prophecy is being fulfilled before our eyes as Great Britain and Judah are reoccupying Palestine previous to the battle of Armageddon (*Rev.* 16:16), referred to in the thirty-eighth chapter of *Ezekiel* and other Scriptures.

Herein we have two groups of nations pictured as fighting against each other: Gog, namely, Russia, and Gomer, namely, Germany, and their allies, against the merchants of Tarshish and the young lions thereof, namely, Great Britain and her self-governing colonies ('the young lions,' v. 13), the United States, and the Scandinavian nations, and a part of Germany probably in the last great war of the

Christian dispensation, immediately preceding the Golden Age, when the swords will be beaten into plowshares, the deserts will blossom as the rose, and the lions and lambs will feed together. (*Isa.* 2:4; 11:6-8; 35:1-10)

Great Britain has possession already of the Sinaitic Peninsula and Palestine, and practically controls all the Promised Land from the Nile to the Euphrates. Her names, too, reveal in part the identity: B'rith is the Hebrew word for covenant; Ish is the Hebrew word for man. Prefix *Saxon*, the ancient *Saace*, with 'I' and we have *Isaacson*. The Court of St. James, from which British ambassadors are accredited to foreign countries, reads in Hebrew *Court of St. Jacob*. The symbols on the British Royal Standard are exclusively Israelitish, namely: the lion of Judah, the unicorn (wild ox: *Deut.* 33:17) of Ephraim, and the harp of David; and her national colors, 'red,' white' and 'blue' with 'gold' occasionally, were four of the five prominent colors in the ancient temple worship. The national colors of the United States are identical with those of Great Britain.

OUR standard is adorned with the 'eagle' of Dan; and the 'man' of Reuben is discovered in 'John Bull' of England and 'Uncle Sam' of the United States. The lion, eagle, ox and man were the four faces of the Cherubim in the Holy of Holies and the symbols on the four main standards of Israel, when our fathers marched through the wilderness under discipline and victoriously across the Jordan. (*Ex.* 25:18; *Num.* 2:3, 10, 18, 25; *Ezek.* 1:10)

Moreover, two of the significant numerical symbols of Israel are stamped on the birth-history of the United States; the *thirteen* tribes (Joseph, which in Hebrew means *added*, having two tribes: *Josh.* 14:4) corresponding with our original thirteen states. It was the Sixty-fifth Congress which self-sacrificingly declared war on Germany. The Armistice was signed in the one hundred and forty-third (11x13) year of our independency. 'Eleven' is the numerical symbol of incompleteness and warning in Scripture; and the four 'elevens' relating to the *hour*, the *day*, the *month*, and the *year* (11 a. m., on the eleventh of November which is the eleventh month), associated with the signing of the Armistice by the United States, indicates that the late war was left unfinished; and our part will not be completed until we face, in alliance with Christian nations, the armies of the Antichrist at the battle of Armageddon (Mount of Slaughter) in Palestine. We discover, too, a significant scripture referring to 'an hour, and a day, and a month, and a year' (*Rev.* 9:15), when men repent not of their evil deeds, just previous to the great battle, in spite of God's more judgments on the earth. (vv. 16-21)

Furthermore, 'thirteen,' a symbol of blessing when linked with humility and self-sacrifice, was definitely associated on several significant occasions with President Wilson, our Commander-in-Chief of the late war, and most noticeably when the thirteen votes of California gave him victory in his last presidential election. 'Old Glory' recalls the baptizing of the red, white and blue' with the Shakinah when the glory of God filled the Tabernacle in the wilderness; and the pyramid on the reverse of our national seal is another link to our identity with Manasseh, the thirteenth tribe of Israel, whose mother was an Egyptian woman. The symbolism of our seal is Hebraic in other details.

The significant fact, too, that practically every great event of the war coincided with red-letter days in Israel's history is another link in the chain of evidence proving the identity, running parallel as it does with the focusing of so many lines of prophecy into one brilliant ray of fulfillment. The war was commenced by the Emperor of Germany on the anniversary of the destruction of Jerusalem, August 1, 1914; on the fourth anniversary of this day, lunar time, the allied armies began to beat back the Germans at the second battle of the Marne; on Palm Sunday, 1917, the American Jews organized their Congress to petition the Gentile powers to grant them a safely protected homeland in Palestine; on Good Friday, 1917, President Wilson declared war on Germany. Solar and lunar time coincided on this day, Passover Day, falling on Good Friday.

On the Jewish Feast of Lights ('Dedication': *John* 10:22), 1917, General Allenby took Jerusalem. This day was probably Christ's birthday (Chevlev 25—December 25). He is the 'Light of the World' and was circumcised on the eighth day, January first, the last day of the Feast of Lights when solar time and lunar time coincide. On the Feast of Tabernacles, 1918, General Allenby took the upper part of Palestine, Nazareth surrendering on the anniversary of the last day of the feast when Christ cried in the temple, 'If any man thirst let him come unto me, and drink.' (*John* 7:37)

Truly, it is not by accident that the great events of the late war occurred on these red-letter days and that the great Anglo-Saxon nations exclusively possess the symbols and colors bestowed by Almighty God on Israel for holy worship and militant service; nor was the sign of the cross accidentally made over the heads of Ephraim and Manasseh when our father Jacob crossed his hands when blessing them in Egypt for prophetical light on our present-day destiny and duty. (*Gen.* 48:13, 14) The ten-tribed house of Israel is mentioned before Judah in Jeremiah's great prophecy, 'Behold, the days come, saith the Lord, that I will make (Hebrew; cut, implying the shedding of blood) a new covenant with the house of Israel and with the house of Judah.' (*Jer.* 31:31)

Careful reading, too, shows that the first part of this chapter refers exclusively to 'Ephraim my first-born' (v. 9); and we are commanded in verse seven to 'sing with gladness for Jacob among the chief of the nations.' This cannot refer to Judah in her despised exile; nor can the following prophecies, which the ten-tribed house of Israel, represented by their Anglo-Saxon descendants, are evidently fulfilling: 'Let them give glory to the Lord, and declare his praise in the islands' (*Isa.* 42:12); 'the isles shall wait for His law' (*Isa.* 42:4); 'hear the word of the Lord, O ye nations, and declare it in the isles afar off, and say, He that scattered Israel will gather him, and keep him, as a shepherd doth his flock' (*Jer.* 31:10); and similar texts, as 'Let thy seed possess the gate of those which hate them.' (*Gen.* 24:60)

Great Britain and the United States possess the 'gate' of practically every enemy, namely, Gibraltar, Panama, Malta, Aden, Singapore, Australia, New Zealand, Cape of Good Hope, West Indies, Philippines, Samoa, Hawaiian Islands, and Porto Rico; and Constantinople is now virtually under the control of the great Anglo-Saxon maritime-nations. Their own gates have been open hitherto to the oppressed of all lands, as is implied in the millennial prophecy. (*Isa.* 60:11)

Israel was forbidden to take 'usury' from brethren (*Ex.* 22:25; *Deut.* 23:19) and was to 'lend unto many nations but thou shalt not borrow.' (*Deut.* 15:6) The Anglo-Saxons borrow of one another; lend to all nations, and borrow from none. The seed of Abraham was to become a vast multitude, after they had become Gentilized (*Gen.* 22:17; *Hos.* 1:10), and the 'stranger' who joined Israel was to be as the 'homeborn.' (*Ex.* 12:49) They were to 'push the people together to the ends of the earth' (*Deut.* 33:17), a prophecy that cannot possibly apply to Judah, either now or after her restoration to Palestine. They were to be in the 'midst of many people as a dew from the Lord' (*Mic.* 5:7)—exclusively true of the 'missionary remnant' of the Ten Tribes.

They were to be superabundantly blessed in cattle, fish, corn, fruit, and in mines of gold, silver, tin, coal, precious stones, oil wells, and so forth (*Gen.* 49:22-26; *Deut.* 33:13-16), blessings possessed by the Anglo-Saxons in a tenfold degree above other nations. And they were to be a Sabbath-keeping people (*Ezek.* 20:12), a prophecy fulfilled primarily by orthodox Jews and orthodox Anglo-Saxon Christians. And sad to relate, the pronounced vice of Ephraim is drunkenness (*Isa.* 28:1); and a difficulty in 'h' (*Judg.* 12:6) still clings to his posterity.

No League of Nations, no World Court, no International Abritration Treaty, no peace plan, however wise from a purely human standpoint, can successfully devise or authoritatively enforce a program for world peace unless based on the prophetical Scriptures in the clear light of their inclusive command to holy living in national and international life. 'The wisdom that is from above is first pure, then peaceable.' (*Jas.* 3:17) There can be no peace without purity, and there can be no purity without the cleansing blood of a spotless sin-offering.

Every noun in the Hebrew language is derived from a verb-root. The verb-root for peace is 'to be complete,' 'to be safe.' The supreme obstacle to international peace is the lack of assurance of complete safety between nation and nation—and chiefly where international boundaries meet. Men should learn through the Scriptural revelation of 'safety' as related to 'peace' why we have enmity between brother and brother, city and city, nation and nation. What is true of individuals is equally true of nations, and the United States cannot intelligently co-

öperate with the divine plan to establish world peace without a knowledge of her place in the divine purpose as anciently enunciated. This truth is the golden key that unlocks the door of prophecy to a clear understanding of our national duty in the present-day world perplexity and peril.

Therefóre, it is evident to the author of this paper that without prophetical light it is impossible to formulate intelligently a practical plan for World Peace, and that no Bible study is more important for right understanding of the present-day world conditions than that which proclaims the identity of the Lost Ten Tribes of Israel with the great Anglo-Saxons of Great Britain and the United States; and, in his judgment, it demands a continuous unity of action on their part similar to that which brought the late war to an end that has not brought peace, because nations which dethroned their earthly kings did not enthrone the heavenly king.

The European nations are so weakened by the Great War that a confederation will finally result for mutual protection under a supreme ruler, the Antichrist of Scripture (*Dan.* 7:8; 2 *Thess.* 2:3-8; *Rev.* 18:1-8, 19:19-20), who at first will favor Judah but later will turn against them and gather his armies against Jerusalem after they refuse him blasphemous worship, when he places his image in the newly erected temple there and commands all men to worship him. (Will this come out of Russia—or whence?)

Chilled Drama

(*Continued from page 7*)

on high stilts, a stunt both difficult and dangerous. He did acrobatic feats of various kinds and beat all competitors skating backward and dodging. Then he became a figure skater. Few men who engage in speed skating ever become successful at figure skating, due to difference in strokes. The long stroke has no place in figure skating and the speed skater, so thoroughly trained in the long stroke, finds it next to impossible to change his style permanently.

Harley Davidson, while never as good as Baptise either in speed or figure skating, was just as versatile. In the days of high wheels Davidson was a crack bicycle rider. Then he became a star roller skater. Later he turned to steel skates. After several seasons of speed skating he became a figure skater. He originated a number of figures that still bear his name.

Speed skating does not require special gifts. Any boy of sound physique should be able to skate fast. Francis Allen was, like Davidson, a bicycle rider. In 1923 he decided to learn to skate. Two years later he appeared in competition. He won the Chicago city title, then the Illinois state title, then the Tri-State title. He won the United States championship at Lake Placid and the international title at Saranac Lake.

Allen is probably the most awkward speed skater of all time. He bears no semblance of form or rhythm. His is the most unorthodox style imaginable. When he takes a turn you marvel how he manages to keep his feet; you cannot understand how he prevents his legs from becoming tangled. But with all his awkwardness and lack of form Allen came from behind both at Lake Placid and Saranac Lake and passed the best skaters that the season produced.

Reward for Future President's Capture

(*Continued from page 13*)

that their outraged feelings might be salved. To their horror, Johnson declined in every case to 'give the satisfaction customary among gentlemen,' not because he was afraid, but because he thought dueling was a foolish and wicked relic of barbarism. As a matter of fact, fear was left out of his entire make-up and he could say with entire truth, 'These two eyes never looked upon any being in the shape of mortal man that this heart of mine feared.'

UPON one occasion he was warned that if he spoke at a scheduled meeting he would be killed. At the appointed time he took his place upon the stand and laying a pistol upon the desk said, 'I understand the first business before the meeting is shooting me. I move the meeting proceed to business.' Nothing happened and nobody moved. Johnson replaced the pistol, remarked with a smile, 'I have evidently been misinformed,' and proceeded with his speech.

In his second campaign Tennessee was full of Know Nothing activity and sentiment and his opponent was a Know Nothing. Johnson made Know Nothingism the issue. He was a Protestant and not prejudiced in favor of the foreign-born, but he did not think religion should be a political issue, holding that to make it one was an offense against the most sacred of American principles. Also he detested the very idea of secret political societies. Intense as he was, Johnson was essentially tolerant and Know Nothingism meant to him political and religious intolerance. When the smoke of the campaign cleared away, Know Nothingism was no longer an issue in Tennessee. It was dead.

At the conclusion of his second term as governor, Johnson was elected to the United States Senate. By this time his character was fully formed and he had reached full mental stature. He had mature convictions upon public questions, based upon thoughtful consideration. Normally a Democrat, he never wore the yoke of a party, declining always to surrender his right of individual conviction and decision to party considerations.

IN TENNESSEE he was a power. As a public speaker he was wonderfully effective and he swept his audiences. Thanks to the carefully prepared newspaper stories and false reports of his speeches during the stormy days of his Presidency, the American people then and since have been given an utterly false impression of him as a speaker. Far from being a buffoon who could not speak grammatically or make a point in an argument, he was the master of an unstudied but trenchant eloquence.

He had a superb voice, low and sympathetic, which carried without effort on his part and without being raised. He spoke calmly but with emphasis, assurance, and authority. His manner was quiet and easy and, as a rule, dignified. But he was a born fighter and never hesitated to engage in verbal tilts of a personal character with his opponents or auditors in which he was tremendously aggressive. He had, in his career before he became President, many political but scarcely any personal enmities.

Johnson never forgot his lowly origin and rarely made a speech in which he did not allude to it, usually proudly and always somewhat defensively. This is characteristic:

'Adam, the father of the race, was a tailor by trade, for he sewed fig-leaves together for aprons. Tubal Cain was an artificer in brass and iron; Joseph the husband of Mary, the mother of Jesus, was a carpenter by trade, and the probability is strong that our Saviour Himself followed the same. The Apostle Paul was a tentmaker; Socrates, the distinguished Grecian philosopher, was a sculptor, but abandoned the fashioning and polishing of the stone for the purpose of cultivating and instructing the human mind. Archimedes, by the exercise of his skill in mechanics, made the enemy declare, when they attacked Syracuse, that he was a modern Jove hurling his thunderbolts upon them. King Crispin was a shoemaker, as was Roger Sherman, who helped to form the Constitution of the United States, and so was Daniel Sheffy of Virginia. General Greene, of Revolutionary fame, was a tinker, while General Morgan, his compatriot, was a blacksmith.'

IN APPEARANCE he was distinctly fine looking. He was of medium height, with broad shoulders and a compact figure which indicated great physical strength. He was erect and walked with an elastic step. His head was finely shaped, with an impressive forehead. He was dark-haired, dark-skinned, and dark-eyed, with almost

an Indian-like appearance. His eyes were small and deep-set, but keen and luminous. His expression was normally grave and at times severe, but his intimates were familiar with a rare, slow smile of considerable sweetness.

He was careful and neat in dress, and it is said that until the war he always made his own clothes. He wore regularly a black broadcloth coat and vest, black doeskin trousers and a silk hat, and regarded them as the proper garb of a statesman. While he was governor, so the story goes, he made a suit of clothes and sent it to another state official whom he had known years before as a blacksmith. The latter at once made a shovel and pair of tongs and sent them to the governor 'to keep alive the fires of early friendship.'

In Congress, particularly after he reached the Senate, Johnson was an important and

powerful figure, though scarcely a leader of first rank. His independence of party control alone would have prevented that. He was, in strangely prophetic spirit, a strong defender of the veto power of the President. He was the author of the Homestead Bill which he introduced first in 1846. The South was bitterly opposed and it was defeated. In the Senate he proposed it again and had the satisfaction of seeing it pass both Houses and the chagrin of seeing it vetoed by President Buchanan. The Republican Party made it one of its pledges in 1860, and it finally became law.

A STATES' Rights Democrat, a slaveholder, with no illusions in regard to the negroes and with something of the dislike of them characteristic of the class from which he was sprung, Johnson was never able to accept the doctrine of secession, not because of his dislike of secessionists, but because of his passion for the Union and the Constitution which to him always typified that Union. The Constitution provided no means of secession and therefore there existed in his opinion no right of secession. And so, during the dark days when Senator after Senator announced the secession of his state, and bade farewell to his colleagues, Johnson stood firm against all pressure and, alone of the Southern Senators, kept his seat, realizing fully the possibility, if not the probability, of thereby condemning himself to perpetual exile from the home of his choice and of his love. His feeling is best expressed in his own words. Speaking on February 16, 1861, he said:

'I have been told, and I have heard it repeated, that this Union is gone. It has been said in this chamber that it is in the cold sweat of death; that in fact it is really dead, and merely lying in state waiting for the funeral obsequies to be performed. If this be so, and the war that has been made upon me in consequence of advocating the Constitution and the Union is to result in my overthrow and in my destruction, and that flag—that glorious flag, the emblem of the Union, which was borne by Washington through a seven-year struggle—is interred, I want no more honorable winding-sheet than that brave old flag, and no more glorious grave than to be interred in the tomb of the Union.'

A contemporary thus explains Johnson's political faith:

TO HIM the creed of creeds was the famous synopsis of principles in the first inaugural address of Thomas Jefferson. To him the greatest toast ever drunk was Jackson's "The Union! It must be preserved." To him the most solemn prayer ever lifted up was Webster's peroration in his reply to Hayne. And to him the greatest blasphemy ever uttered was the saying, "There is a law higher than the Constitution." '

While he remained in the Senate he supported President Lincoln in every move he made for the preservation of the Union, and the two men were drawn into a close sympathy destined to have important results later. In their view of the nature of the Union and the purpose of the war they were in full accord, and the Johnson Resolution declaring the purpose of the war, which passed the Senate, embodied the views of Lincoln as well as those of Johnson. It was:

'That this war is not waged on our part in any spirit of oppression, nor for any purpose of subjugation, nor purpose of overthrowing or interfering with the rights or established institutions of those states, but to defend and maintain the supremacy of the Constitution and to preserve the Union with all the dignity, equality, and rights of the several states unimpaired.'

In 1862 Lincoln appointed him military governor of Tennessee, with the rank of brigadier general, charged with the task of restoring in the state a civil government loyal to the United States. The difficulties in the case were tremendous but Johnson met them with courage, ability, and tireless energy, and was in the end successful. Hated already by the secessionist element, this new Union activity vastly increased their hostility. As he became a real factor in securing Union success the feeling against him was very strong. But he gained strength and slowly organized Union sympathizers until he had the nucleus of a Union population in Nashville itself.

Two years later, through the efforts of Lincoln, Johnson was selected as his running mate in the campaign of 1864. His reasons for selecting Johnson are fairly clear. Apart from the fact that Johnson had become before the war a sort of idol of the mass of the people, particularly in the West, who saw in his rise promise for themselves and their children and in him a never-failing advocate and friend, his stand for the Union made him a unique figure in the United States. Both of these made him exceptionally strong as a vote-getter.

BUT there were even more important reasons. The choice of Johnson was dictated by a desire to show the outside world by the nomination of a Southerner that the seceded states were still part of the Union, and a desire to express to the country, by the choice of a Democrat, the reality of the name Union Party which the Republican Party now assumed. There was probably still another reason. Lincoln's whole soul was absorbed in his plan of reconstruction and Johnson was whole-heartedly in agreement with his policy.

Triumphantly elected, Johnson came to Washington for the inauguration. His inaugural address was delivered with stammering tongue. All the later stories of his drunkenness originated here and had no other basis. The explanation was entirely satisfactory, but few people ever heard it. Johnson suffered from an acute affection of the stomach and had a severe attack during the night preceding the inauguration. He was so weak when morning came that the attending physician gave him a drink of brandy to enable him to attend the ceremonies. In his weakened condition it went to his head and ever since he has, in spite of his very temperate habits, been painted as an habitual drunkard. There is no evidence to prove that he was ever intoxicated at any other time.

A few weeks later, in the early morning of April 15, he became President of the United States.

Questions might be raised as to his suitability for the office under existing conditions. There was room for doubt if his was the temper that was necessary for the task before him. But of his mental quality, his honesty, his patriotism, and his courage, there was no room for doubt. He was, every inch of him, a man.

(*To be continued in an early issue*)

The Strengthening *of* American Traditions

Through the revival of the Old American Dances

THE methods of the world-famous Ford School of Dancing at Dearborn are made available to everyone in the unique manual of these fine Old American Dances, entitled:

'Good Morning'

Compiled by Mr. and Mrs. Henry Ford.

This book gives complete information and instruction on each of these dances, style and deportment, and also explains how to arrange and conduct a successful Old American dancing party.

Printed in clear type and bound in flat-opening form

Price

75c

Piano Music (also suitable for violin) for 14 Old American Dances, 50c.

Orchestrations of 12 parts (including saxophone) can be supplied for 20 Old American Dances, at 25c for each dance.

Trade discount to schools, dancing instructors, music stores and orchestra leaders.

THE DEARBORN PUBLISHING COMPANY
Dearborn, Michigan

Has Our Country a Father?

(*Continued from page 8*)

I undertake no defense of Parson Weems. The story of the cherry tree and little hatchet, which appeared in his sixth and all subsequent editions, and the story that his father, in order to teach George that events have causes and that the great first cause is God, planted cabbage seed in a bed so arranged that the little plants should spell the name GEORGE WASHINGTON, are told in pompous language such as Parson Weems thought appropriate in a book about so great a man, but they are not inherently improbable.

IT IS said that Weems got the cabbage-seed story out of another book, and adapted it to his own use; perhaps Mr. Washington got it out of the same book, and thought it would be a good lesson for his own son. But even if Parson Weems invented the story, that would be a minor matter. Biographers do more inventing than their readers suppose, and Parson Weems was not the first or last offender in that regard. But so far as I can learn there is no proof that the incident is not substantially true.

As for the little hatchet story, this, at least, is to be said, that George Washington was remembered by those who knew him in youth as a truthful boy. Mr. Weems said he got the story from an aged and distant relative who was a frequent visitor at the Washington home. So far as I am aware, no one now living is prepared to prove that he did not so obtain it, and my own impression is that he tells the truth in this detail at least.

As for the conversation between George and his father:

'I can't tell a lie, pa; you know I can't tell a lie. I did cut it with my little hatchet!'

'Run to my arms, you dearest boy; run to my arms! Glad am I that you killed my tree,' and so on; that need not cause us more than a passing smile. Of course the boy and his father did not talk in that stilted style. But if the incident ever got into grand opera, it would be told in some such bombastic manner, and musical experts would not be troubled, any more than they are at the present preposterous absurdities imposed by the mutual limitaticns of singing and acting.

The heroine in real life dies with voice so weak as to be quite inaudible, but on the stage she dies on high C fortissimo. No heroine ever died on high C, but a heroine must so die in grand opera. The original readers of the little hatchet story were not deceived into supposing that George and his father said those actual words; that was the proper way for a father and son to talk in a book in the year 1805.

But, sifted down to its essential elements, 'an aged lady who was a distant relative and when a girl spent much time in the family' told Parson Weems that George Washington when a lad injured a choice young tree belonging to his father, and when the injury was discovered did not lie but acknowledged that the fault was his, and his father did not punish him for the hacking of the tree, but commended him for telling the truth. That is a good story and not an improbable one.

With all its faults, and they were many, Weems' *Life of Washington* made a profound impression on the minds of American youth. The character displayed may have been too good to be true, but not too good to be admired and emulated. And I maintain that it is not good sportsmanship in modern biographers to kick-off with a cheap fling at Parson Weems.

'No life of George Washington,' says William Roscoe Thayer, on page two of his biography, hardly waiting to record the birth of his hero and the names of his parents, 'no life of George Washington should fail to warn the reader at the start that the biographer labors under the disadvantage of having to counteract the errors and absurdities which the Reverend Mason L. Weems made current in the *Life* he published the year after Washington died. No one, not even Washington himself, could live down the reputation of a goody-goody prig with which that officious Scotch divine smothered him. The cherry-tree story has had few rivals in publicity and has probably done more than anything else to implant an instinctive contempt of its hero in the hearts of four generations of readers.'

And no life of Washington now appearing omits the duty which Thayer enjoins. Henry Cabot Lodge thrice vanquished Parson Weems and thrice he slew the slain, and we shall not mention the biographies of 1926.

I recall my own boyhood, and know that I was unlike Washington. I could tell a lie, and now and then I did. When caught in mischief, my first impulse was to lie, and more than once I escaped punishment by doing it. Nevertheless, I was habitually a truthful boy, and I remember an incident which I have never related in which I had an experience with my father.

I had free access to the money drawer in my father's little store and office, and while I was expected to ask permission to take money, or to give account of it afterward, the taking of a cent for a stick of candy was not considered a theft, although even that would not have been approved. Some larger boys wanted money to buy powder, and at their urgent request I took a dime, an old shinplaster dime, and we bought the powder. We made some experiments with noise and flash, and our powder was gone. I took another dime and bought more.

A FEW days later we repeated the process, and we found our work the more interesting because it was dangerous. The merchant from whom we bought the powder, a quarter pound for each dime, told my father he would do well to see what his boy was doing with so much powder, and father investigated and we were caught in the act. The other boys promptly disclaimed all responsibility. I had stolen the money and had bought the powder. I had to admit it. I would have lied if there had been any way out.

I was sent to my room and locked in, a prisoner, and at supper time I was furnished with a slice of unbuttered bread and a glass of water, the proper fare for a thief.

That was, as far as I recall, the longest afternoon and evening of my life. After I had partaken of my supper and found that it choked me, my father came to me and cross-questioned me. Was this the first time I had ever stolen? I assured him it was. He counseled me to be frank with him, but I stuck to the lie.

None of the other boys were standing by me; my only refuge was that of my own falsehoods. And the falsehood worked. The other boys, fearful of what might come to them, when questioned separately, agreed that we had never played with powder before and that I had never before stolen any money in whose guilty benefits they had shared. My father, I think, did not believe me when he left me, but after talking with the other boys again, he accepted the story. He gave me no word of forgiveness that night. I lay down in my guilt, and if I slept it was not because my conscience was clear but because I was a boy and tired out.

NEXT morning I went down to breakfast, and there was no mention of the event. After breakfast my father called me aside and reminded me that I had always been trusted, but now he must insist on a strict accounting for every penny. And this I accepted as just.

So far as any fear of further punishment was concerned, I was out of the woods. And I was most unhappy. I do not know how long I carried my guilty secret. I only remember that one morning as father was building the fire in his store, before breakfast, I went to him and told him all.

I am not foolish enough to try to put our conversation into type. It might read as badly as that of Parson Weems, but this I know, that from that minute my father trusted me completely and that I never lied to him again.

I had a wise father, who could be stern and was stern in condemnation of wrongdoing, and who used the whip with some severity. But when I went to him on that chilly morning, and told him that I had stolen money before the time of which he knew, we were in each other's arms and both in tears, and it was the first time I ever saw my father cry.

I do not therefore make any cheap jokes about the cherry tree. Shorn of its stilted language, the incident seems to me very similar to the one I am relating. But I doubt if George said he could not tell a lie.

I have been reading two recent books about George Washington, and each of them has some merit. But each of them takes great delight in setting forth the fact, as alleged, that George Washington swore at Monmouth, and that he wrote a love letter to Mrs. Sally Fairfax while he was engaged to marry Martha Custis. I should like to say a word about each of these.

As for his swearing at Monmouth, he may have done it; I do not know. He was depending upon General Charles Lee to make an advance, and he came up at the moment when that movement should have been making a victory complete, and he found that much lauded general, whom half the army believed superior to Washington, in cowardly retreat. Brave men were dying, and others were facing death that day—my

great-grandfather among them—and their sacrifice would have been successful if Lee had done his duty. But Lee failed, and Washington was angry.

I have been told that he was furiously angry, and I hope that is true. It is alleged that he expressed his opinion of General Lee in terms not suitable for use in Sunday school. The story is alleged to have come down to us on the authority of General Lafayette, in 1824, and he is declared to have said that was the only time he ever heard Washington swear. But the man who told this story said Lafayette told it to him when Lafayette was visiting in this man's home, and it appears that Lafayette never visited that man in his home.

LEE did complain, at his court-martial, of the language of Washington, and Washington in reply said his language was such as he deemed suitable to the occasion.

I am not sure myself just what language might have been deemed suitable for an occasion of that character, and if Washington felt sure that he knew what words Lee deserved, I have much confidence in the judgment of George Washington. I will not say he did not swear; if he did he had no little provocation.

Comes now the Sally Fairfax letter, hidden from historians till comparatively recently. For nearly a hundred and twenty years after its writing it was unknown, and it has become public property just in time to delight a number of critics. 'George Washington at the time of his marriage to Martha Custis loved another woman, and she was the wife of his friend!' So we are informed. And the letter looks a little as though that was the case. Certainly it was an ardent letter for a man about to marry, and writing to a married woman. It is no part of my business to explain it.

Judging of it on its face value I should say that if Washington had not been engaged to marry the rich but commonplace Martha, and Sally had been free, he might have preferred Sally, and Sally must have known it when she read that letter. Probably other young men, pausing on the brink of so momentous a choice as that of one woman out of the whole community of womankind, have had some searchings of heart as to whether, under some conditions, he might have preferred someone else. But George Washington did not elope with Sally Fairfax. She lived and died the trusted wife of her wedded husband, and visited Mount Vernon when Martha had measles, and neither Martha Washington nor William Fairfax appears to have been jealous.

THE letter, which I wish Washington had not written, or wish had been somewhat differently phrased, was written September 25, 1758, and was published in the New York *Herald* March 30, 1877. If Washington loved Sally Fairfax as much as this letter appears to indicate, and she loved him enough to preserve and cherish the letter, they both must have behaved with no little self-restraint to keep their affection from the gossip-mongers and slanderers of their own day. For these persons were numerous and active.

But now, after all our research and muckraking, where is George Washington the hero? There was such a man. No commonplace man incarnated the spirit of the new republic, and kept it alive through the seven years of war and the more dangerous years that followed. Only a great man could have done that, and our boys and girls need to know about that great man.

What recent life of Washington makes him seem truly great? Which of them is capable of kindling in the spirits of American boys and girls that thrilling admiration which some of us learned to cherish for Washington?

I am no opponent of historical criticism. In another and a kindred field I am doing and am yet to do my share of it. I have had to dispel not a few myths concerning Abraham Lincoln. But the Lincoln I have discovered under the fierce light of historical investigation is a greater, nobler Lincoln than the Lincoln of the myth.

Abraham Lincoln in his boyhood read with avidity Weems' *Life of Washington*, and it did him lasting good. The story of the cherry tree never seemed to him to indicate that Washington was a prig. That inference was reserved for more subtle minds in later years. What life of Washington that our boys and girls are reading now is capable of producing on modern American youth the effect which Weems' *Life of Washington* produced upon Abraham Lincoln?

If there is no such book, there ought to be one. Our boys and girls need a Washington who is no joke, and especially who is not to be accounted a prig because he faced punishment rather than tell an untruth. They need a Washington who is both human and a hero. I want our boys and girls to know a Washington who was great enough and good enough to have been the father of his country. There was such a Washington. He was, in my judgment, the real Washington, human, but a hero.

Economy—the Poor Man's Mint

(*Continued from page 2*)

cessaries today. And so from time to time the installment situation in such 'transition' lines, of what may be termed semi-luxuries, must undergo reorganization, conforming to their changing status from that type of goods to the class of staple requirements.

Installment selling and buying, like anything else, is not to be condemned wholesale. Some things which on account of the large sum involved in their purchase would ordinarily be impossible of acquirement by people of average or relatively small means, except by intensive saving over a period of years too long to be practicable, properly belong to the field of monthly payment financing.

Of these the buying or building of a *home* is the chief and best example. A family must pay rent somewhere and pay all the time, therefore its payments on the installment purchase of a home are in the nature of payments of rent which would have to be paid, to a greater or lesser extent, anyway. This is not in the same category as buying luxuries or things which can be done without. Rent, or a home, cannot be done without; whether or not you want to buy a home you must pay rent or the equivalent to someone, and that continuously. Buying a home simply shifts the expense to one's own advantage usually. The mortgage on real estate is one of the most ancient forms of business dealing; it is derived from the very immovableness of the land and buildings generally, and the continuity therein of basic values.

Domestic unhappiness often results where one or more members of a family are harassed by relentless debts brought constantly and sometimes insultingly to their attention by the creditor concerns which were glad, doubtless, originally to push the sale. One judge of a divorce court recently attributed by far the largest percentage of the cases handled through his court to this one source—to 'installment buying,' as he terms it.

THE banks generally have not taken a definite stand on the question; some have announced views for or against installment selling. But practically all of them have blown cold by fits and starts when the measuring possibilities of 'too much installment' have loomed.

There is a way whereby banks might participate and benefit themselves—and others—by utilizing the current fashion of selling things on the easy-term plan. For this class of business the banks need not require their customers to come to them; they would on the contrary send out solicitors, high-pressure men and women sales people, to sell savings accounts to persons in offices, stores, manufacturing plants and in the homes; to sell them accounts of say $100 or $500, or more, on the popular installment plan, to be paid for weekly or monthly in 'easy payments.'

The banks must not in these cases depend on their customers to come around to the 'store,' as it were, to make payments, but must employ collectors to go around and collect them on the dot when due, and use such vigorous means as may be possible to keep the 'debtor' lined up, to make him 'toe the mark' with regularity. Suppose the collection cost to amount to upward of one per cent, using salaried and bonded collectors, it is merely to be understood with the 'buyer' of the savings account that this cost is deducted from the amount of the interest due him on his savings account. Whereas if he pays at the bank window he will get the full amount of interest on such payments.

The advantage of selling savings accounts is that *the banks would really be selling something which would be worth the full sum, and more,* of the installments paid in. Such installment purchases would be very worth while, would not deteriorate with time or depreciate, but on the contrary by the usual system of interest charges would become steadily more valuable. The apparent public craving to 'buy' something on the installment plan would be gratified, and it might test out the question at any rate of whether the confirmed installment buyer is interested in buying something truly worth the regular payments of money he is asked to make in this case.

DEBT is the worst poverty,' it has been said; a man in debt and insolvent is in a sorrier plight than he who is moneyless but without debts. Franklin never ceased to preach the joys of being debt-free. 'Rather go to bed supperless,' he said, 'than to rise in debt.' Another has strikingly said that 'debt is like any other trap, easy enough to get into but hard enough to get out of.'

Does the installment plan represent the very *best* that American business men can devise?

CHATS WITH OFFICE CALLERS

Will Rogers dropped into The Office the other day, same old Will, wearing the same old brown suit in which he interviewed all the rulers of Europe. Will may be making money, but there is no theatrical flashiness about him, none of the lingo of the Hollywood crowd. The reason for this is, of course, that he is not a theatrical man. He is simply Will Rogers. Typing his 'Self-Appointed Ambassador' stuff on the train—he uses one finger of each hand to run his typewriter—sitting in private and talking offhand about anything at all, or doing his two-hour stunt on the stage, he is precisely the same in voice, thought, speech, gesture—simply and only Will Rogers. Somebody who knows how to do it should classify Will with our times as the ancient satirists were classified in theirs. I saw the other day a book review in which John Jay Chapman says that Peter Finley Dunne (you know—the Dooley man) was the modern prototype of Lucian. Well, I think Will Rogers will stack as high if not higher. Neither Dunne-Dooley nor Rogers is a clown. Take Ring Lardner, for example, or some other of the Sunday weekly humorists; they are forever clowning. But Will Rogers is serious. Did you ever see him tackle a subject for comment that was not serious? And did you ever feel that he had failed to get at the very heart and nub of the matter and split it open with a laugh? The answer is twice in the negative. The fact is, Will Rogers is a philosopher; so much of a philosopher that he has left the mechanics of philosophy far behind and has graduated into the higher region of humor. The so-called philosophers of our universities are not philosophers—they are merely students of systems of philosophy. If they were real philosophers in operation they would be tackling life instead of textbooks. Will Rogers tackles life, because he can. Humor is the highest gift; it is without alloy; Rogers has it. The editorial last week, or whenever it was, in this paper, that suggested making Will Rogers Secretary of State for Pan-American Affairs is no joke. We need a serious-minded man like him in public affairs.

ɾ ɾ ɾ

'Smuggling seems to be an ineradicable trait in human nature,' said ***the Former Customs Inspector.*** 'It was my business to study it for years, and it still keeps going strong, for I see that a half-million dollars was paid to the Collector of the Port of New York alone, in 1926, in fines, seizures and forfeitures. You'd think that poor folk would be the ones most likely to try the game, to add to their income, but it's just the other way about. Smuggling is a weakness of wealthy people.

'On the summer tourist ships, that offer low rates to school-teachers, college students and other people of moderate means, you'll rarely uncover an attempt to smuggle contraband. On the contrary, this class of travelers declares everything, no matter how insignificant it may be. But it's when the crack liners come into port that the customs men confiscate the pearl necklaces, the fur coats, the French perfumery, the diamonds and costly shawls that wealthy persons, and mostly women at that, are trying to get into the country duty free. Most of these people have no true reason for trying to take such risks. They simply can't resist the temptation; probably they get some sort of thrill out of the game.

'Often women are caught because they can't resist bragging to their friends about what they're going to do. Sometimes these friends aren't quite so friendly as they appear, and secretly tip off the customs men. It's a usual thing, and this I've often witnessed myself, that in trying to smuggle in an expensive fur coat, the smuggler boldly wears it, and when she's caught, she makes the plea either that she supposed wearing apparel was exempt, or that some friend of hers hadn't paid the duty and she thought therefore she didn't have to. In a case of this kind, the Government not only seizes the article, but if the owner wants it back, she has to pay the current American price for it, plus a 100 per cent fine. In other words, she has to pay exactly twice as much for the smuggled article as she would have paid in a New York store. Of course the big money to smugglers is in jewels and precious stones. The duty on set stones is at the rate of $800 on a piece valued at $1,000, while if they are unset it is not so high, being at the rate of about $200 to the $1,000 purchase. So where the real jewel smuggler is successful, the professional, I mean, he is in the way of making considerable profit.'

ɾ ɾ ɾ

'There are all sorts of opinions about advertising,' said ***the Advertising Man*** who had dropped into The Office, 'and the only answer is—look at advertising. When men made things by hand, they could sell by hand; mass production has made mass selling a necessity. Word-of-mouth advertising is excellent, but it is the last phase—the result of successful advertising of another kind, and not a substitute for it.

'The romance of our work is endless. I remember a New England manufacturer who has now a national reputation—has had, for years. [He told the name, but obviously it cannot be printed.] One of our boys stopped off in his little town to see him, but it was no go; he had thrown so many advertising men out of his office that he thought he had at last found the only unbeatable system. Our man got out, all right, but he didn't quit. He asked to see the plant. It was shown him. "But," said he, "I don't see where you pack your goods." "Oh," said the manager, "we don't pack them here; we send them in bulk to the people of the village; they pack them." I should explain that the product was a semi-medicinal candy edible. Our man got the names of twelve families that packed in the village, and set out to visit them. He found sickness and dirt, coughing and spitting, and every kind of unsanitary condition surrounding the handling and packing of those candy medicinal things that were going into customers' mouths wherever the product was sold. He took a package from each home and went down and weighed them on the apothecary's scales of the village drug store. He found that every one was overweight. There was no system in the packing.

'So he went back to the manufacturer, who told him more angrily than ever before that he did not believe in advertising. Then our man described what he had found in the homes of the packers. It was at the time that *Collier's* and other magazines were making their great drive for purity in products. "You would believe in advertising if *Collier's* should discover the conditions under which your goods were packed, wouldn't you? Ten lines telling the truth about you would close you down forever." The man agreed that it would look bad. "Well, that's advertising," said our man, "but it is not the kind you want. After what I have seen, our company would not handle your advertising if you wanted it. But I will tell you something else. If I can save you enough money to put in decent packing machinery, will you spend that amount in advertising?"

'The man agreed but he could not see how the money could be saved. "I'll tell you," said our man, "there are one or two drops too many in every hand-packed package. Save the overweight and it does the business." Again the manufacturer would not believe, but again the hard facts were shown him. And he put in the machinery.

'The result is that you and everybody in this country know that man's product. His total business when our man first saw him was five tons a day. Now it is twenty-five tons a day in his nearest big market alone—not to speak of the rest of the country.'

ɾ ɾ ɾ

'I went to one of these tolerance meetings in my home city on the invitation of the Jewish rabbi,' said ***a Minister from the Middle West*** who had dropped off between trains. 'The rabbi asked me what I intended to speak about. I told him that I had been thinking of giving an address on "Henry Ford, the Friend of the Jews." He was quite surprised, and I told him that I knew some things that I thought would make for greater tolerance if they could be understood, for there was no stronger neutralizer of intolerance than the truth.

'My rabbi friend did not take kindly to the suggestion—I put it that way to be well within the facts. He wanted tolerance, but apparently not too much. When I got up to speak, I jocularly called attention to the lack of tolerance in that Tolerance Meeting. Here I was, ready to deliver myself of statements that would make for Tolerance in one of our most fretted questions but I was prohibited by the chairman.'

'Exactly,' said I, 'it is always those who holler loudest for tolerance who are most set against giving it. The history of tolerance is that it is always and everywhere extended to the intolerant, but never assimilated by them. Tolerance is a condition of mind they wish to create in others' minds, but not in their own—like European pacifists who wish to disarm the United States but not themselves. However, no need to worry about that. The people who are wise enough to be tolerant are also intelligent enough to keep their eyes peeled.'

CAN YOU TELL ME?

QUESTION: Why is the letter 'w' called 'double u' when in form it is a 'double v'?

ANSWER: The form 'w' is what is called in French 'double vay' or 'double ve,' but in sound it is for us what its English name denotes, that of 'double u.' 'U' and 'v' were formerly used interchangeably.

QUESTION: Why do the British figure one hundred twelve pounds to the hundredweight while the symbol they use, 'cwt.,' indicates hundreds only?

ANSWER: In England a hundredweight is equal to eight stone, a stone being fourteen pounds. A ton is equal to one hundred sixty stone and a bushel to four stone. Likewise the British avoirdupois or commercial weight considers twenty-eight pounds a quarter, and four quarters a hundredweight, although in reality, one hundred twelve pounds.

QUESTION: What are the five countries having the largest air and naval forces in the world?

ANSWER: Great Britain, United States, Japan, France and Italy.

QUESTION: When did the present immigration law become effective? What are the European quotas?

ANSWER: July 1, 1924. The annual quota from each country until July 1, 1927, is 2 per cent of the number of persons born in that country who were residents of continental United States as shown by the 1890 census; but the minimum quota is 100.

QUESTION: Was the territory acquired by the United States in the Louisiana Purchase ever claimed by England?

ANSWER: France held explorer's title to the entire Mississippi Valley, including the land in the Louisiana Purchase. This, however, was ceded to Spain in 1762 (England refusing it, preferring the Floridas), but was retroceded to France in 1800, from whom the United States got it in 1803.

QUESTION: Where does Eastern and Central Time begin?

ANSWER: The United States adopted Standard Time in 1883. The meridians of 75°, 90°, 105° and 120° west from Greenwich are the time meridians of Eastern, Central, Mountain and Pacific Standard Time respectively.

QUESTION: How did the word 'dad' originate?

ANSWER: Of the actual origin there is no evidence, but the forms dada, tata, meaning father, originating in infantile or childish speech, occur independently in many languages. It has been assumed that our word is taken from Welsh tad, mutated dad, but this is very doubtful; the Welsh is itself merely a word of the same class which has displaced the original Celtic word for 'father.'

QUESTION: Which party is the strongest and how many members are there of each in Congress?

ANSWER: The 69th Congress: 42 Democrats, 53 Republicans, and 1 member of the Farmer Labor Party in the Senate; 248 Republicans, 182 Democrats, 1 Independent, 2 Socialists and 2 Farmer-Labor members in the House of Representatives.

An unofficial list of the 70th Congress which will convene in December of this year gives 48 Republicans, 47 Democrats and 1 Farmer-Labor in the Senate; 237 Republicans, 194 Democrats, 1 Socialist and 2 Farmer-Labor members with 1 vacancy in the House.

QUESTION: How old does a person have to be to join the Navy with his parents' consent?

ANSWER: He must be eighteen years of age.

QUESTION: Where can information be procured concerning employment with government surveyors?

ANSWER: An inquiry addressed to the Board of Civil Service Examiners for Engineering, Department at Large, Chicago, Illinois, or to the Board of Civil Service Examiners for Engineering, Department at Large, Rock Island, Illinois, should bring the information desired. Or a letter may be addressed to the Civil Service Commission, Washington, D. C.

In this department we shall do our best to answer questions concerning Government and kindred matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

QUESTION: Could you tell me how many soldiers the United States maintains in Alaska?

ANSWER: At the end of June, 1924, there were 392 soldiers stationed in Alaska.

QUESTION: How are appointments to the United States Naval Academy at Annapolis made?

ANSWER: The students of the Naval Academy are styled midshipmen. Three midshipmen are allowed for each Senator, Representative and Delegate in Congress, and fifteen appointed each year by the President from the United States at large. The selection of candidates, by competitive examination or otherwise, for nomination for vacancies in the quota of Senators, Representatives and Delegates in Congress is entirely in the hands of each Senator, Representative and Delegate in Congress having a vacancy; and all applications for appointment or inquiries relative to competitive examinations should be addressed accordingly. Two examinations for admission are held each year, the first on the third Wednesday in February, the second on the third Wednesday in April.

QUESTION: Why is Philadelphia called 'The City of Brotherly Love' and at what period of its history was this name first applied to it?

ANSWER: The word means 'brotherly love' or 'loving the brethren,' derived from a Greek word of that meaning. It was first so designated by William Penn.

QUESTION: What is the drop of Niagara Falls and how far is it across?

ANSWER: The Horseshoe Falls have a total width of 2,950 feet measured along the curve, or 1,230 across the chord. The American Falls are 1,060 feet wide. The drop is 164 feet.

QUESTION: How many people are working for the United States Government?

ANSWER: At the end of the nation's fiscal year, June 30, 1926, there were 560,705 civil service employes on the federal payroll.

QUESTION: What state does each star on our flag represent.

ANSWER: On October 26, 1912, the executive order of President William H. Taft was made concerning the specific location of the stars and their definite representations; they were to be arranged in six rows of eight stars each, the stars to symbolize the states in the order of the states' ratification of the United States Constitution.

I READ IN THE PAPERS

At Antioch College students may some day obtain degrees without attending classes. Arthur E. Morgan, president, is planning a system of autonomous courses under which regular classroom work would be dispensed with. Classrooms would be altered into small libraries where references on particular subjects would be available, and professors would schedule office hours during which students would confer with them and exchange ideas. The student would accept the entire responsibility for the arrangement of hours of study, and the completion of the necessary labor would be placed on him. It is believed this will instill a sense of responsibility instead of the feeling of compulsion which now prevails in all colleges. In the end this will prove its value provided the students will coöperate. Next semester a small number of students will apply for the special course. If it proves successful, others will be admitted.

Antioch College Plans Novel Course

Statisticians have figured the time lost in every other business operation. Now they might figure the time wasted in figuring statistics.—Chicago *Daily News*.

ɤ ɤ ɤ

Bankers have been interested in Mexico before the present fracas. Some sixty years ago Mexico was prostrated with internal strife. Napoleon III of France had long cherished the idea of a Central America under his control. The Monroe Doctrine was in force but the Union was weakened and in the throes of the Civil War. He pictured an interoceanic canal across the Isthmus of Tehuantepec. The time to strike was auspicious. But he had no legitimate excuse to act. So he turned about to find one. A Swiss banker named Jecker came forward, stating he had a claim against Mexico. By royal decree he was turned from a Swiss to a Frenchman. Then Napoleon assumed Jecker's alleged claim and announced that Archduke Maximilian of Austria, brother of the emperor of Austria, would be put on the throne of Mexico as king. Maximilian sailed with his wife Carlotta, a daughter of the king of Belgium. But the Mexican people revolted and Maximilian decided to abdicate. Not so Carlotta who 'had drunk deep of the joys of power and tasted the glories of a golden crown.' Maximilian remained on the throne while Carlotta hastened to Napoleon for succor and assistance in the form of military force. But Napoleon was not anxious to oppose the Monroe Doctrine too strongly. Who knows what a united north and south might do to back that doctrine? Carlotta then appealed to Pope Pius, but her entreaties fell on deaf ears. It was then that Carlotta's reason snapped and she became a raving maniac and was taken back to her father in Belgium. That was sixty years ago. Carlotta died but recently. Maximilian without her was helpless. Abdication, flight, capture and the Hill of the Bells at sunrise. That was his just desert. The story of Maximilian, Carlotta and Jecker is just another chapter in the unfinished and unending book of conquest. There is no evidence that Jecker, the banker, risked his neck. He is believed to have remained in safety on the Continent.

Mexico and the Banker's Claim

ɤ ɤ ɤ

The Federal Bureau of Entomology is preparing a list of every known economic pest on the North American Continent. A place should be reserved for the idler who has a half-hour to spend and who spends it with some one who hasn't.—Seattle *Times*.

ɤ ɤ ɤ

It is quite the thing to play golf with your grandmother at St. Andrews, Scotland, where almost everyone plays golf, and there is no age limit. On all holidays and half-holidays you may see the butcher or baker going out with his clubs and quite boldly shouting 'Fore' to the aristocrat or millionaire who has also come along to take part in the game.

When the Lion and the Lamb Golf Together

There is also at St. Andrews a children's golf club and course, and little tots go out to play with their nurses. All the nurses—St. Andrews girls—can, of course, play golf, and it is generally the child with the best nurse-coach that wins. A match, granddaughters versus grandmothers, is a possibility.

Visitors can play the famous 'old course' for fifty cents, on the New and Eden courses for twenty-five cents, while for a fourth course, called the Jubilee, the green fee is six cents. Residents may play on the 'old course' free, and this probably accounts for their all-round proficiency.

ɤ ɤ ɤ

A contemporary points out that cabbage contains the ingredients of gun cotton, yet no motorist ever takes the trouble to ascertain whether his pedestrian happens to be a vegetarian.—*Punch*.

ɤ ɤ ɤ

'Tra-a-a-i-n n-u-mm-b-e-e-r ninety-six on track seven now ready. A-a-al a-board for Borax Flat, Cottonwood Canyon, Funeral Mountains, Hearse Hill, Dead Man's Well and all points south in Death Valley. A-a-l Aboard!'

All Aboard for Death Valley

For an enterprising railroad is penetrating that most gruesome of America's unexplored regions—Death Valley in California. There the best-behaved thermometers froth at the mouth and blow up with a bang. Old-timers such as Death Valley Scotty and Dad Fairbanks aver that even the rattlesnakes fear sunstroke. The shimmering veil of mystery that has hung over a land of horror is about to be raised so the pop-eyed tourist from the East may look at nature in its wildest form. Accommodations are being prepared on the edge of the valley for travelers who care to visit it over the new rail and bus routes. The mighty Panamint Range frowns down from the west. Here the dying prospector saw the false mirage; saw the green, verdant valleys of another land with sparkling brooks and singing birds; ocean liners warping into port, and cool, glacier-fed streams dashing down the mountainside. Eagerly he would hasten toward them only to have them dissolve into thin air and soon in weakness he would be crawling. Perhaps he found a well but the bones of other men and animals lying about warned him of its poisonous waters. But no more will there be the drama of men caught in the desert and expiring on the baking and unheeding expanse, for the trip may soon be made in comfort and safety.

All any citizen of the United States could possibly desire is as much protection by his Government at home as he gets in Nicaragua. —Detroit *News*.

ɤ ɤ ɤ

Furnaces roar in the department of Yonne, France. The sky reflects the glow of the open hearth as it eats the ore to make steel. The ore is slag residue left by the Romans in the early centuries after Christ. Near Troyes there are huge slag deposits with an iron content of more than sixty per cent. This slag contains more than twice as much iron as ordinary Lorraine ore. Italy has experimented with similar slag and in exchange for this exceptionally high grade of slag Luxembourg producers are sending their steel scrap to Italian mills. Charcoal iron made by the Romans did very well for that day but they could not get the intense heat in the furnaces that is possible today and simply cast the slag aside.

Slag of Ancient Romans Made Into Iron

ɤ ɤ ɤ

A trusty convict at Sing Sing carelessly left a window open in the potato cellar in the main building. Snow drifted in and caused a fuse to blow out. This shut off the lights on the wall and most of the buildings of the prison for two hours. It also started a fire in the electrical apparatus at three o'clock in the morning. Extra keepers were rushed to guard the walls in pitch darkness. There was a great heap of coal inside the wall which would have made ascent easy for any who had attempted to escape over the frozen river to liberty. But not only did the 275 who have sleeping quarters in the building where the fire occurred make no attempt to get away, but they coöperated with other inmates in the prison fire department and helped to preserve order and subdue the fire. The final check-up revealed every one of the 1,600 prisoners.

Convicts Display Loyalty to Their Prison

THE THIRD SENTENCE in the annual report of President Butler of Columbia University contains 1,743 words, 125 commas and 32 semicolons.

THE BUREAU of STANDARDS in Washington has devised a paper that is said to be able to withstand the wear and tear of folding twice as long as the paper now used in United States currency.

OF THE TWENTY-TWO million dolls made in the United States during 1926, only about one million were blonds.

MEMBERS OF A RELIGIOUS sect in Siberia reside underground from the age of forty till death. The cave dwellers call themselves 'Subterranean Dwellers.'

PATENTS FOR A MICROPHONE built by a German inventor, Emilo Berliner, were filed in the United States nearly fifty years ago, two weeks before Edison announced his invention of the carbon transmitter.

ACCORDING TO SIR W. ARBUTHNOT Lane, noted British surgeon, fair-haired persons are more able to fight against disease than dark-haired ones.

THE ARC WELDER IS supplanting the noisy riveter in the erection of modern steel buildings.

ALMOST ALL OF THE WORLD'S supply of camphor, an important ingredient in the manufacture of modern explosives for high-power guns, comes from Formosa.

MANY MODERN WORDS and figures of speech are based upon the devouring of food. The word 'nag' originally meant to gnaw or nibble; 'fret' meant to eat or devour; 'remorse' meant to bite, and 'worry' to strangle.

THE PETREL, WHICH obtains its food by seeming to run on the surface of the sea, is named for Saint Peter, who, through faith, tried to walk on the Sea of Galilee.

THE EARLIEST MEASUREMENTS were based on parts of the human body. The 'inch' developed from the length of the thumb joint, the 'hand' was the four inches across the human hand and the 'span,' nine inches, was the space from the end of the thumb to the end of the little finger.

EACH INDIAN ON THE tribal roll of the Osage Indians was allowed $2,300 with which to do his Christmas shopping.

ANTS ARE FOUND TO MOVE at a much faster speed in warm weather than in cold.

WITHIN FOURTEEN MILES OF London, the Kentish village of Downe has neither gas nor electricity, no main drainage, no doctor, no movie, and no omnibus, or street car.

STEAM SPRAY IS NOW being used by paper-hangers to remove old wall paper.

BOYS PLAYED MARBLES EVEN in the early days of the Indian mound builders.

THE ARGENTINE CAPITOL at Buenos Aires, rising impressively above an extensive plaza, was constructed, with true Latin-American magnificence, in three months, with an expenditure of five millions.

PUPILS ATTENDING rural schools in Oxfordshire, England, are provided with bicycles by the school board.

THE FIRST WALL PAPER factory was established at Albany, New York, in 1790.

THE INSTITUTO BOUTANTAN in São Paulo, Brazil, is one of the most remarkable of the world's establishments. Here are housed thousands of snakes for the purpose of determining antidotes to their venom.

FAKE INDUSTRIAL AND CORRESPONDENCE schools take $35,000,000 annually from the public according to the Federal Trade Commission.

THERE ARE STATED TO BE 3,000,000 human beings still held in slavery.

WIDOWS ARE MORE SOUGHT after as wives than spinsters by the men of Ulster, both bachelors and widowers.

WOMEN WITH RED HAIR USUALLY keep their fair complexions unblemished to a more advanced age than those with darker hair.

ONLY ONE PERPETUAL pension is now being paid by the British Government. This is the annual sum of $25,000 to the holder of the Nelson earldom.

THE WORLD'S GREATEST disasters by fire were: London, 1666; Moscow, 1812; Chicago and Paris, both 1871; Boston, 1872; Baltimore, 1904; San Francisco, 1906; and Salonica, 1917.

THE PROPRIETOR OF AN INN at Dikovina, in the Trans-Baikal territory of Siberia, provided her customers with 'whale steaks' from a mysterious source of supply, which on investigation proved to be the carcass of a mammoth preserved by the arctic cold for nearly 20,000 years.

A GERMAN SHIP LOADED with beans collided with another vessel on the Yangtze River. The loaded ship sprang a leak and the beans swelled, bulging the decks and opening the seams. A salvage raft came to the rescue but the boat was almost a total loss.

THE LATEST EVOLUTION in the line of fancy singing birds is a pure white canary, not an albino.

THE TENANT OF THE Foulis estates in Scotland, in accordance with an old feudal agreement, is supposed to pay for his lands with a bucketful of snow.

EVERY CITIZEN OF MONTPELLIER, France, claims that he is entitled to call himself baron. In 1537 the Baron de Caravette, who lived in Montpellier, bequeathed his title and estates to the city. Hence, it is argued, every child born in the city may adopt the title.

SIXTY-TWO PER CENT OF Canadian families own their own homes.

AFTER SEVERAL YEARS of experiment a young French mechanic has invented a bicycle which can be transformed into a small monoplane and fly to a height of 150 feet.

NO FORMER BRITISH CABINET Minister now draws any pension.

A FIBER ROPE THAT IS unsinkable has been produced in Holland. The rope includes a core of 'foam rubber' that has a specific gravity only one-fourth as great as that of cork.

A CLAUSE IN THE Detroit laundryman's union contract gives permission to the employer to launder his own shirt provided 'he does not employ any other shirt ironer and is not assisted by any other person or persons.'

PRINCIPAL CROPS GROWN in the United States during 1926 reached a total farm value of only $7,802,114,000 as compared with $8,949,321,000 in 1925.

BOBBED HAIR IS BANNED in the Chinese Province of Chihli by order of the military governor.

STARTING AS A MAIDSERVANT, Miss Sillanpaa is now Assistant Minister of Industry in the new Socialist Cabinet of Finland.

AT THE DEPTH OF A mile the ocean bed is well illuminated by the luminous organs of the fish living there, according to one scientist.

TWENTY-EIGHT DISTINCT mountain ranges can be seen on the journey across Montana, Idaho, Washington and Oregon.

REYKJAVIK, CAPITAL of Iceland, will be heated by hot water from nearby hot springs, if plans of the prime minister materialize.

MORE FURS ARE WORN in the United States than in any other country in the world.

MUKERJI, A STUDENT AT the King Edward Medical School, Indore, India, is said to have run 100 yards in nine seconds, and 220 yards in twenty seconds. This would make him the fastest human being on earth.

NOTES - COMMENTS - CRITICISMS

MR. FORD'S Page this week discusses capital punishment.

ɤ ɤ ɤ

The cover design of this number is by W. A. Dwiggins. It is one of the most striking yet reproduced, representing construction and destruction, order and chaos, building up and tearing down.

ɤ ɤ ɤ

Do people buy things they do not want or have no immediate use for? This thought is developed in an article by Henry Laket who devotes special attention to the installment plan business. (p. 1)

ɤ ɤ ɤ

Daniel W. Hoan, mayor of Milwaukee, tells us how crime was suppressed in that city. The elimination of banditry and lawlessness is the objective of other big cities. Milwaukee's plan has worked well. (p. 3)

ɤ ɤ ɤ

Are the best books those that serve as library ornaments or those that are really read? Thomas L. Masson asserts that the best books are the cheapest books. (p. 5)

ɤ ɤ ɤ

Skating is the most popular winter sport and one of the oldest, but there is an immense distance between skating as it is practised now and as it was a century ago when the Pickwickians reveled on the ice at Dingley Dell. H. G. Salsinger chats about some of the modern marvels of the frozen speedway. (p. 7)

ɤ ɤ ɤ

William E. Barton thinks that there was a George Washington great enough and good enough to be the father of his country. But that Washington seems to have been lost sight of. (p. 8)

ɤ ɤ ɤ

Like King Robert the Bruce, a future President of the United States once was a fugitive with a reward offered for his capture. J. G. de Roulhac Hamilton relates this incident in the first of a series of articles of rare interest. (p. 12)

ɤ ɤ ɤ

Centuries ago the crafty Greeks moved on Troy in a wooden horse, captured, and sacked the city. The World War saw the wooden horse reborn—in the tank. It is difficult to exaggerate the rôle played by this new weapon in the Allies' final victory. But possibly more interesting is the rôle the tank will play in the future. (p. 14)

ɤ ɤ ɤ

Some believe it will be a veritable dreadnought of the land, moving with all the stateliness and power of a battleship at sea. Others vision the tank as the cavalry unit of the future, darting about with speed and protection never possible to a horse. Here is an authoritative article, written by an army officer whose experience and training fit him particularly for the task. (p. 14)

ɤ ɤ ɤ

Another of Hugh Walpole's delightful short stories appears in this issue. It is one of his best and is sure to have a wide appeal. (p. 16)

ɤ ɤ ɤ

Many believe that America's greatness is because the American people are the descendants of the Lost Ten Tribes of Israel; that the line of continuity is Israelites, Anglo-Saxons, Americans. With this as his theme an illuminating story is told by Mark John Levy. (p. 22)

It is very interesting and especially refreshing to have news come to your subscribers by such recognized spokesmen as Bishop George E. Miller, of the Protestant church, and Bishop Pascual Diaz, of the Roman Catholic church in Mexico, in your issue of the 15th of January. Judging by my own hunger for the facts in the controversy, your fairness by putting the two articles side by side for a waiting public's choice fills a long-felt desire.

For some reason or other our daily papers leave this very interesting question severely alone, or else color it to the point where one feels like he is reading propaganda. You have done the job creditably and you are deserving of the public thanks if you succeed in arousing an indifferent or misled public to a true sense of justice in the matter.

RUSH P. CRAWFORD.

The Adams Publishing Co.,
Hull, Texas.

May I commend your editorials in general and your 'Boobs and the Ballot' editorial in particular?

Certainly you have rightly evaluated the situation, placing the whole hopeless mess where it belongs, on the shoulders of the 'boob citizen.'

He is in every local meeting. He will hear the proposition discussed, pro and con, then sit like a dumbell when a vote is taken.

Truly 'Boobery cannot be abolished, nor intelligence increased, by law.'

THE DEARBORN INDEPENDENT appeals to me as being the best edited journal in America.

S. W. ADAMS.

23 Tenney Building,
Madison, Wisconsin.

As to the origin of the name Wisconsin—

The French explorers came up Green Bay and into the mouth of the Fox River, where a few miles up they encountered rapids, and from there on rapids, and again rapids repeatedly. They called the locality *On-s-quon*—descent, meaning where it descends, or where one descends. Speak these words rapidly, giving the vowels their French values. Let Indians slur them and English-speaking nonscholarly men interpret and you would soon easily and naturally evolve Ouiskonsan and Wisconsin.

Have seen many conflicting versions of the origin of Wisconsin name. This seems to be the only rational and probable one. It is not original with me; I found it in an old magazine forty years ago.

ALLAN D. CONOVER.

'OUT O' LUCK'

A Touch of Southern Hospitality *in Doorways*

Colonial Architecture *Still Holds Its Influence, as* Modern Homes *Will Evidence.*

Right—
An entrance that suggests the romantic hospitality of the Colonial period. With beautiful simplicity the entablature, with frieze and cornice, extends a genuine invitation.

Beautiful in its restraint yet friendly withal is the story of this doorway. O'erhung and o'er-draped with vines the embracing and peaceful atmosphere of home is suggested.

Below—
The skill of our Colonial architects needs no other champion than its doors. For embellishment and chaste effect they are unsurpassed. The lovely fanlight over this doorway is particularly noticeable and augments the attractiveness of the entrance.

Below—
This doorway is strong enough to hold its place as a dominant architectural feature. It is a modern adaptation carrying the best tradition of the Colonial. Its gleaming whiteness is especially characteristic.

The MOON—*A Vast* Desert *Without* Water, *Without* Air, *Without* Life

By
PROFESSOR F. R. MOULTON
As Told to J. V. NASH

THE moon, as the heavenly body nearest the earth, has from time immemorial been an object of curiosity and wonder to man. Much about he moon was learned by the peoles of antiquity without the aid of elescopes. The ancient Greeks, in articular, possessed a great deal of nformation as to its apparent movement and phases, but they never scertained its actual distance from ne earth, its size, nor the real characer of its orbit.

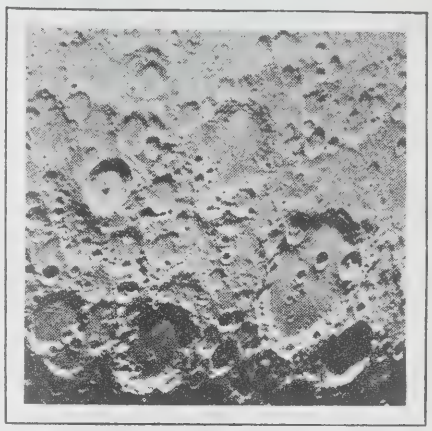
At a very early date the moon beame the basis for man's first calendar. 'he important division of time which e still call a *month* akes its name from he moon. The oon's frequent and riking changes in ppearance, repeated t periodic intervals, rst led to its use in easuring time. mong the Egypans, the divinity of ne moon, Thoth, was ne god of measure, the reckoning of me, and of wisdom nd science generally.

In Greece, Thoth as identified with ermes, the heavenly essenger and the od of commerce, inention, and athletics. The Hebrews, common with other ncient peoples, used ne month, which is ne period in which ne moon passes rough its phases, om new moon to ew moon. We still etermine by the oon the occurrence Easter.

Many primitive races regarded the moon, like the sun, as a living person; and the moon deity, generally a goddess, occupied a prominent place in their mythologies.

The marks on the face of the moon, which are clearly visible to the naked eye on a bright night, have given rise to many extravagant fancies and speculations. Our ancestors in the long ago believed that there was an actual 'man in the moon.' Widely separated tribes, from the Eskimos of the Far North to the aborigines of the South Seas, have their legends about the man in the moon.

The Malays, for instance, believe that the marks on the moon represent a banyan tree under which a hunchback is sitting, plaiting a fishing line. When the job is finished he will fish up everything on the earth; but fortunately for us a rat is constantly gnawing away the line so that it is never completed.

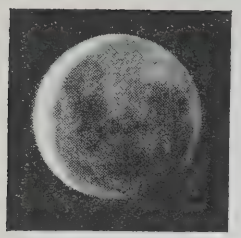


The great crater Clavius, with smaller craters on its rim and in its interior.

An eclipse of the moon, like one of the sun, was always regarded with greatest consternation by primitive peoples. Almost universally they believed that the phenomenon was caused by a monster attempting to devour the beautiful orb.

Then, too, in all ages the moon has been held responsible for innumerable terrestrial phenomena. Endless superstitions have grown up respecting its effects upon human affairs. The word *lunatic* testifies to this early belief in the influence of the moon upon the human mind, as it means literally 'one who is moon-struck.' It will not be questioned, however, that the full moon, glowing with its soft and tender radiance on summer nights, has had an important influence upon countless thousands of

The appearance of the full moon as disclosed through a large telescope.



A slender sunlit crescent embracing the earth-lit night portion of the moon.

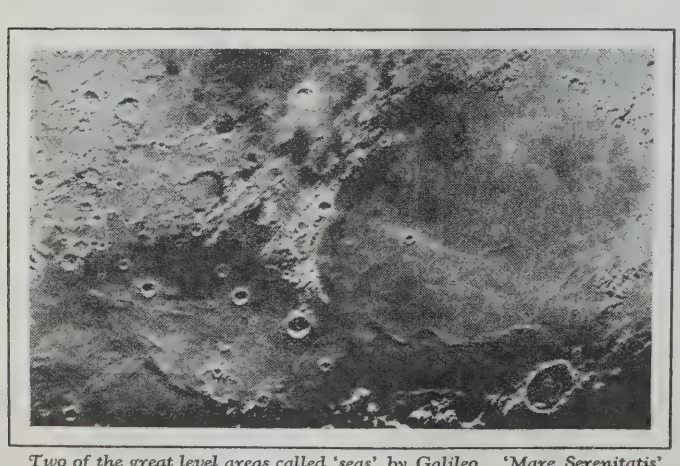
human romances, and has been perhaps the world's greatest matchmaker. Tennyson speaks of her as 'the planet of love.'

Turning now from fancy and fiction to scientific fact, what do we find that modern science, with its methods of precision that have revolutionized the world, says about the moon? First, a few figures. The mean distance from the center of the earth to the center of the moon is now known to be 238,862 miles, the circumference of its orbit is 1,500,818 miles, and its diameter is 2,160 miles, or a little more than one-quarter that of the earth. The period which the moon takes to pass through its phases, which are of course determined by its position with respect to the sun, is 29 days, 12 hours, 44 minutes, and 2.8 seconds.

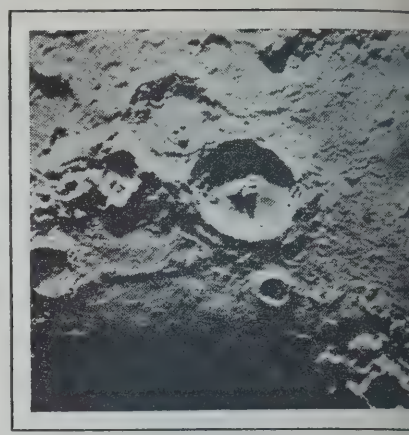
As a matter of fact, astronomers have measured the distance to the moon with as great a percentage of accuracy as they have the distance from Chicago to Detroit. They have determined the period of the moon's revolution around the earth to within 1/1,000 of one second of time. They have measured the diameter of the moon with an error not exceeding one mile. Its motions are known so accurately that a telescope could be set today so that our successors a thousand years from now, looking through it, in a given year, month, day, hour, minute, and second, could see any part of the moon which we might decide upon at the present time.

These statements are verified by the fact that we predict the occurrence of eclipses with unerring accuracy, and navigators use observations of the moon to locate their positions at sea in the night. Not only this, but the mass of the moon has been determined, and the effects it has upon the earth have been measured. When a man stands at night out beneath the moon, he is subject to the attraction of the earth below and of the moon above. Rough conjectures might lead one to suppose that the attraction of the moon is comparable to that of the earth. The fact is, however, that the moon pulls him upward with a force only 1/288,000 of that by which the earth draws him downward. Consequently, it is evident that the moon by its attraction exerts no appreciable direct effect upon us. It is true, of course, that the tide ebbs and flows in endless surges, whose periods are about thirteen hours, as a consequence of the effects of the moon, but what we see on the seashore when the tide comes in and goes out again is the accumulated results of the moon's feeble forces acting on the millions of square miles of the ocean's great surface. The tides in the Great Lakes, for example, are inappreciable, although these bodies of water are of so great extent that one is several hours out of sight of land while sailing across the

Reflected light on the moon at the period when it is eight and one-half days 'old.'



Two of the great level areas called 'seas' by Galileo. 'Mare Serenitatis' and 'Mare Tranquillitatis' are their names.



The great lunar crater Theophilus, sixty-fou miles in diameter and 19,000 feet deep. Th peak in the center towers 11,000 feet abov the plain from which it rises.

It is interesting to note, this connection, that the hi rigidity of the earth was det mined by my colleague, Profess Michelson, from measuring t slight deformations the earth u dergoes as a consequence of t moon's attraction. These marv ous experiments prove that t earth, through and through, is rigid as steel and that it is elast like steel.

But admitting, as we do, the forgoing considerations, it nevertheless the confident opini of scientists that the moon h inappreciable effects on ordina human affairs by its direct attra tion.

A more widespread opinion that the moon's light and possib heat are important climatic facto and that they influence the grow of crops. When one looks up the cloudless sky at night in t full moon, one is impressed with i great brilliance and is likely think that its light is really co parable to that of the sun.

As a matter of scientific fact, ho ever, sunlight is 600,000 times brilliant as full moonlight with t moon at a corresponding altitud Perhaps a more illuminating statemen is that the earth receives as much lig and heat from the sun in thirtee seconds as it receives from the moo in the course of a whole year. passing cloud in daylight has great effects on the temperature of a give place than the direct moonlight ha The amount of light given off by th moon varies, of course, with its phase Over the period of an entire month, th average amount of light and heat comin from the moon to the earth does no exceed 1/2,500,000 that from the su

Consequently, from the very natu of the case it seems highly probab that the moon has no appreciab effect upon the weather. This co clusion is confirmed by weather record extending over (Continued on page

A Mexican Speaks to Americans

By JULIO ZETINA

THE DEARBORN INDEPENDENT asked the President of the Rotary Club of Mexico City to address a letter to American Rotarians on the relations of the two countries. Here is the reply of Mr. Zetina.

[TRANSLATION.]

THE DEARBORN INDEPENDENT has requested of me, as president of the Rotary Club of Mexico City, a statement addressed to the Rotarians of the United States regarding the present condition of the relations between our respective countries.

Undoubtedly for me the easiest and surest course would be to decline to say anything on a matter which I have no particular capacity for judging except from the necessarily limited point of view of the business man entirely removed from the political field. But although Julio Zetina as an individual might decline to make a statement, as president of the Rotary Club, whose high mission is founded on the ideals of service, he feels himself inevitably bound to lend his aid, no matter how insignificant it may be, to the satisfactory settlement of a dispute which is seriously threatening the friendly relations that should exist between two neighboring peoples.

Naturally the only source of information that I have on which to base my opinion regarding the matter is that given by the newspapers and, for obvious reasons, such information is not always correct nor in every way complete.

THE origin of this entire dispute appears to be the decision of the Mexican Government to put in effect certain laws emanating from our present Federal Constitution and the determination on the part of the American Government to prevent the interests of its nationals existing in Mexico from suffering loss and damage by reason of the enforcement of said laws.

Looking at the matter in this light, it is evident that both governments are confining themselves strictly to the carrying out of their respective duties; the former by enforcing its laws and the latter by protecting its citizens.

However, the matter has now arrived at such a stage that only one solution would appear possible, that is to say that one of the two governments radically alter its policy—either the Mexican Government must withdraw from its purpose to put its laws in practice or the American Government forgo the protection of its nationals. Neither of these solutions is acceptable at first sight and therefore if, as it is to be hoped and as I believe certain, a friendly settlement is arrived at, both governments must give way in part.

People are not lacking, both in Mexico and the United States, who claim that any surrender could be made only at the expense of national honor of the party making the concession; nevertheless I am of the opinion that national honor can be maintained and at the same time a satisfactory settlement can be made if only a small amount of good will may be exercised.

If the Mexican laws to which the United States objects are confiscatory and therefore contrary to the principles of international law, surely our Supreme Court, in deciding the cases of violation of constitutional guaranties, which will undoubtedly be brought by the interests affected, will so declare and thus put an end to the difficulty.

If, on the other hand, the laws are just and the interests that claim to be damaged thereby are only endeavoring to have them repealed or modified out of mere caprice or excessive ambition, undoubtedly the American Government will so acknowledge and withdraw its support from such interests.

Our great statesman, Benito Juárez, said on a certain occasion: 'Respect for the rights of others means peace'; and it is evident that our respective governments, if inspired by the great truth expressed by those words, will find a way to conserve the just rights of each and at the same time refrain from violating those of the other.

In the meantime, Rotarians of the United States, you have at hand an excellent opportunity to make good as regards the Sixth Purpose of our organization: 'The promotion of international understanding, good will and peace through association of the business and professional men of the world united by the Rotarian principle of service.'

For this purpose it will be sufficient if in the two thousand communities where your clubs are established you become ardent boosters for Mexico; that you use every endeavor to create a better knowledge of this nation among the American people; that you make public the fact that Mexico is not such a country as it is painted by a certain malevolent portion of the American press—a land of thievery and murder—but a young country with the defects of youth and inexperience; and that the people are just as respectful of foreign rights, just as honest and just as hard working as any other civilized nation in the world.

BY this means of publicity, of undeniable effect, since it will be put forth in more than two thousand cities by more than one hundred thousand business and professional men selected from the flower of the American nation, you will be able to direct public opinion in favor of Mexico, since the promotion of better understanding means the attainment of true and sincere friendship.

On our side we Mexican Rotarians will endeavor to carry on a campaign of publicity for the purpose of having the American nation understood as it really is, and we shall undoubtedly succeed in removing that lack of confidence created among our people by the policy of threats which unfortunately several governments of the United States have thought it advisable to use against Mexico on different occasions.

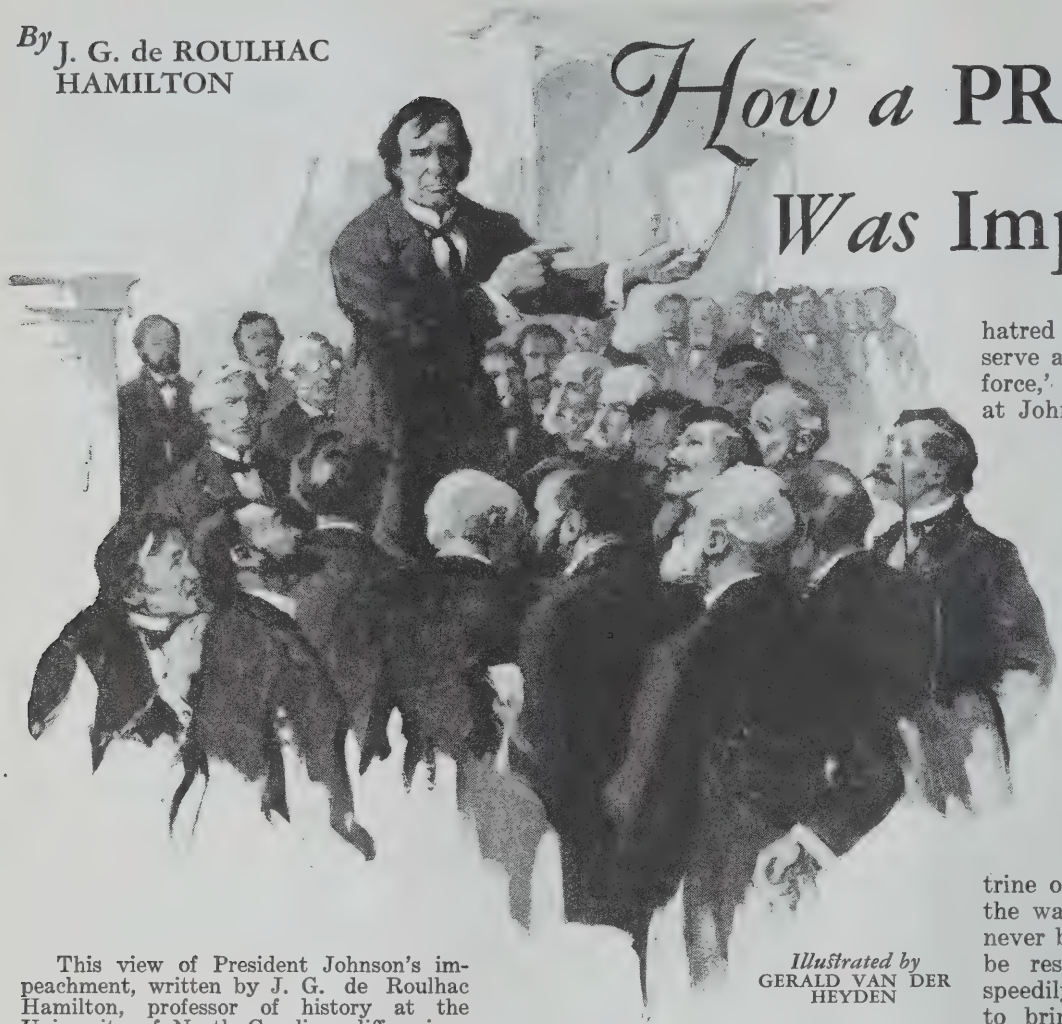
As true international fraternity can exist only when based upon absolute confidence, by attacking this lack of confidence we are fighting against enmity and for good will.

Let us work then untiringly on this great enterprise for international fraternity and be sure that our respective governments will follow along the path marked out for them by the opinion of the people who granted them their confidence through their votes when raising them to power.

Mexico City, January 17, 1927.

By J. G. de ROULHAC HAMILTON

How a PRESIDENT Was Impeached



Illustrated by GERALD VAN DER HEYDEN

Thaddeus Stevens making the speech which closed the House debate on impeachment, March 2, 1868. The speaker's remarks were a bitter denunciation of the President.

This view of President Johnson's impeachment, written by J. G. de Roulhac Hamilton, professor of history at the University of North Carolina, differs in a number of major points from others which have been heretofore published. It presents a unique and possibly partisan view of one of the strangest public men in the nation's history. Another character summation of President Johnson is that given by the late John Ford Rhodes, eminent historian, whose death occurred recently:

'When his personal animosity was aroused, he would not accept the disinterested advice of those best qualified to give it. He utterly failed to see things as they were. And he acted as if he had the country at his back, though in fact he had no support whatever. The Democrats had little respect for Johnson although they were willing to use him as a means to injure their party antagonist. The Southern people were coming to look upon him as an impotent friend . . . True enough, as after events have shown, Johnson stood for some correct principles, but he had the knack of doing even right things in the wrong way, so that all his salutary action came to naught and the Southern people might well have exclaimed, Defend us from such a friend.'

—Editor's Note.

ANDREW JOHNSON as President sought to carry out Lincoln's policy for the restoration of the seceded states to their place in the Union. By so doing he won the implacable personal and political hatred of the radical leaders in Congress who had hated Lincoln no less, and for this he was impeached, narrowly escaping removal from office.

It can scarcely be said, however, that he was the scapegoat for his great predecessor. Johnson, it is true, carried out Lincoln's policy; but he did so only because he was convinced that it was the right one. It was his own policy as much as it was Lincoln's. Had Lincoln lived, he would have met the same bitter radical opposition and hatred, and he might possibly have lost the fight as did Johnson. But against such a conclusion must be placed the power of Lincoln over the minds of the mass of Americans. It is difficult to believe that any such conspiracy as was formed against Johnson could have been carried against Lincoln to such a conclusion as impeachment.

While Johnson came to the presidency superbly equipped for the position as far as experience, character, and sheer ability were concerned, he nevertheless labored under a number of heavy handicaps. Temperamentally he was no politician and could never gain his ends by the skilful indirection which was so large an asset to his predecessor. So violent had he been against secessionists, and so intense had been his determination that punishment should be meted out to them, that the radical leaders in Congress, who had opposed Lincoln with bitter hatred for his determination to p serve a 'Union of hearts as well as force,' made no secret of their delig at Johnson's accession. 'Johnson, have faith in you,' said 'Blu Ben' Wade, later his bit enemy. 'By the gods, th will be no trouble now running the Government.'

But Johnson was a lifelo Democrat and a Southern and hence, in spite of his Uni war record, an object of s picion. From the standpoint Thaddeus Stevens he was 'alien' from 'conquered te tory,' and hence not lega President. His intense c victions, his boldness in ma taining them, and his compl sympathy with Lincoln's d trine on which the North had fou the war—that the seceded states h never been out of the Union and m be restored to their full rights speedily as possible; all these were s to bring him into conflict with group of radicals in Congress who w bent on regaining the power lost Congress to the President during war and on imposing hard terms on South. These motives lay behi congressional reconstruction, and soon as Johnson became an obsta to their fulfillment, his removal w determined upon by the radical leade

During the summer of 1865 Jol son put into operation the policy reconstruction outlined by Linco with but few changes or modificatio The South met the terms and reorganization of the state gove ments went on rapidly and smooth In the North the policy met, app ently, with hearty approval. Eve state convention, Republican or Den cratic, in the autumn of 1865, with exception of Pennsylvania and Mas chusetts, where Stevens and Sum were in full control, voiced this sen ment and in the excepted cases Jol son was not condemned.

Morton and Andrew, the governors of Indiana and Mas chusetts, gave the President th hearty support, as did, among othe Henry Ward Beecher. Among th who wrote him pledging support w Hannibal Hamlin, General John Dix, General George H. Thomas, E. Washburn, Lyman Trumbull, Goverr Curtin, Simon Cameron, Reverdy Jol

on, B. Gratz Brown, Senators Dixon, Cowan and Doolittle, Jeremiah S. Black, George Bancroft, Francis Lieber nd General W. T. Sherman. The ress approved.

The New York *Evening Post* said, The President is already proving himelf by his successive acts one of the ost discreet, clear-sighted, upright, nd capable statesmen of the age,' and he *Nation* commented on the fact that is policy had 'the miraculous property f appearing to satisfy all parts and arties of the country.' Later the same aper declared the President's plan o be 'the highest example of humanity, elf-restraint, and sagacity ever witessed—something to which the hisory of no other country offers any pproach.' Finally, the larger number f governors' messages in December nd January gave the policy hearty pproval.

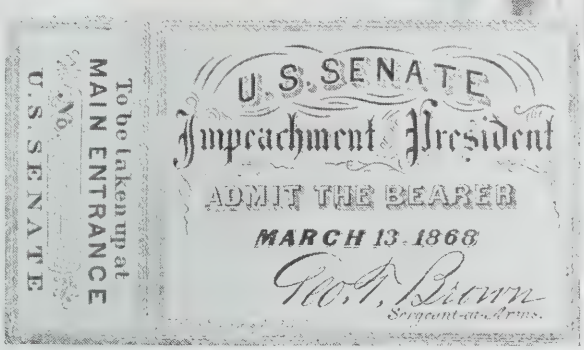
If it is asked why this era of good eeling did not continue, the answer is imple. The radical leaders were deermined to carry out their policy. he archenemies of the resident and his policy, s well as of peace and econciliation, were Thadeus Stevens and Charles umner, who, working from ifferent points of view nd with different motives, eached almost identical onclusions of practice, if ot of theory, and formed coalition upon which sts the responsibility for hat we call reconstruc-on.

Stevens, the abler and ore influential of the two, as a practical politician who looked t every question from the angle of arty expediency. Calculating, selfish, nscrupulous, and imbued with an ndying hatred for the South, he ought to inflict upon it harsh punishent. Lacking any repulsion in reject to the negro, he advocated entire quality and practised it. Sumner, n the other hand, was a theorist of the y, idealistic, impractical sort, who ade a fetish of human rights and quality and ended by worshiping an naginary being which he called the egro, for whose actual embodiment, y the way, he entertained an inactive and almost unconquerable ysical disgust. Lacking sensibilities any sort, he was incapable of passion, , indeed, of any real emotions. He ved in abstractions and to secure hat he theoretically regarded as stice was willing to inflict almost any ncrete wrong. This unusual pair ere the leaders in framing and directg Congressional reconstruction.

WHEN Congress met, Johnson's first essage, written in its final form, as e now know, by George Bancroft, was well received by the country, but it had no effect on Congress, which declined to recognize the reorganized governments or to admit the Senators and Representatives from the Southern States. A joint committee on reconstruction was formed, ostensibly to investigate conditions in the South but really to formulate a policy of reconstruction. On the floors of the two houses they began to abuse and slander the President, making it clear that he must yield or come to an open breach with the majority. Little did they know Johnson if they expected him to yield. While bitterly disappointed, he behaved with admirable patience and dignity during the greater part of the following winter. A great many Republicans favored his policy and a more politic and tactful man might have won them over. Lincoln could have done so. But downright and direct Johnson could not, and meanwhile radical leaders loudly cracked the party whip and enlarged upon the danger to the country—and to the party—if Johnson won, and in time this had its effect.

In January the President vetoed the Freedman's Bureau Bill and won in Congress. But in March his veto of the Civil Rights Bill was unsuccessful and in the meantime, in a speech at the White House, he had bitterly attacked the radicals in Congress, who he said, specifying Stevens and Sumner by name, were 'as much opposed to the fundamental principles of the Government' and 'as much laboring to prevent and destroy them' as the men who had fought against the Union in the war. When the President took the offensive, his enemies in Congress came out into the open and the breach was complete. Radical leaders from now on incessantly worked for his impeachment and removal from office.

Ladies and gentlemen presenting their tickets for the impeachment trial at the entrance to the Senate chamber.



Thus far the radicals had no policy save that of opposition to the President, but during the spring they passed the 14th Amendment which became one of the issues of the Congressional elections of 1866, the real issue being, of course, Congress versus the President. It was the most heated contest for the control of Congress in American history, with four national conventions, the President on the stump, and the radicals working night and day to convince the country that Johnson was plotting to turn the Government over to 'the rebels' and destroy all the gains of the war. They were afraid of the country and had not dared thus far to expose their plans to the public view. The President, on the contrary, was very confident that the people were with him and had little fear of the result.

DURING the campaign the President made his famous 'swing around the circle.' Invited to Chicago for the dedication of the Douglas monument, he accepted, and accompanied by a considerable party, which included Seward, Welles and Randall, of his Cabinet, General Grant, and Admiral Farragut, he (*Continued on page 25*)

OUR ILLEGAL SPENDERS

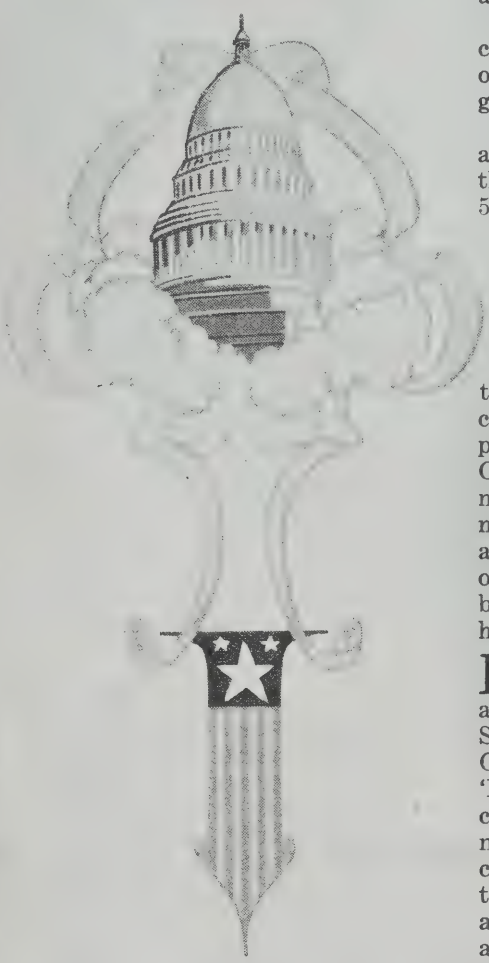
Deficiency Appropriations Not Authorized *by* Law

By MARIAN BRUCE CLARK

HUNDREDS of millions of dollars are illegally expended by administrative officials who depend upon so-called deficiency appropriations to make it right. The abnormal increase in the annual Federal budget may be traced to the generally accepted practice of expending public money first and collecting through Congress afterward. This practice involves grave deception of the public, because the total 'deficiency' appropriations passed during the first session of the 69th Congress reached approximately a half-billion dollars. This is just $500,000,000 more than the public was originally led to expect that the government would cost. This system of 'deficiency appropriations' tends to impair public respect and weaken control of the legislative branch of the Government.

THE Constitution of the United States (Article XIV, Section 4) provides that 'the validity of the public debt of the United States authorized by law . . . shall not be questioned.' Yet, three deficiency bills representing not deficiency but expansion requirements and aggregating the huge sum of $487,851,377.41 were passed as riders to the regular act for 1927 to supply funds for activities admittedly *not* '*authorized by law.*' These demands emanated from virtually every department in the Government, including the Executive Offices, and furnish accurate evidence that such expenditures represent, not legal continuation but illegal, in the sense of unauthorized, expansion of government activities. The regular Appropriation Act for 1927 has been increased by eleven per cent of the original requests by the loose business methods of these aptly characterized 'illegal spenders,' whose disregard of the ancient prerogative 'through official channels' costs the Government hundreds of millions of dollars each year.

The Controller General in attacking the present disbursing system has recommended to Congress that disbursing officers be placed under the direct supervision of the General Accounting Office in his department, thus effectively removing them from the influence of departmental heads. He points out that a centralized spending system would not only reduce the huge total of illegal payments which



under the present method are constantly being made by more than 1,000 disbursing officers through the United States, but would result in a large saving in salaries by reducing the number of these officials to about fifty. More than $300,000,000 in illegal payments is now outstanding in the General Accounting Office for which, in all probability, the Government will never be reimbursed, and $3,000,000 in public funds has been illegally paid out during the past year.

While some departments are more consistent offenders than others, it may be pointed out that the major delinquents continually head the list of the 'illegal spenders' year in and year out. For instance, at the first session of the 69th Congress, these occurred:

The Veterans' Bureau requested a deficiency appropriation of $116,250,000 in addition to its regular allowance of $579,215,000.

The Post Office Department came next with a deficiency demand of $103,217,177 added to its original grant of $842,322,910.

The Department of Agriculture asked and received $28,070,626 more than its legal allowance of $127,924,573.

The Department of the Interior, $7,601,000 supplemental to its legal appropriation of $226,332,918.

The list might be indefinitely extended since virtually all departments have become addicts to the deficiency habit, not one of which can claim legal justification except, perhaps, the Post Office. The Controller General openly recommends that Congress refuse the numerous demands of the 'spending agencies' and the sole supervision of their expenditure of public moneys be placed under the jurisdiction of his office as provided by law.

IN DENOUNCING the deficiency appropriation habit, Senator Reed Smoot, chairman of the Finance Committee of the Senate, states: 'In relation to the growing evils of certain departments of our Government, as well as certain states, of continually spending more money than allowed by law thus creating a deficiency, it should never be allowed—except in extreme emergency. I have protested against it hundreds of times on the floor of the Senate, and while the budget has eliminated a great part of it, it still exists.'

While the regular Appropriation Act is heralded each year by front-page announcements in the press of the country, the strategy employed by those departments designated as 'illegal spenders' provides for no headlines, no hearings, and none but perfunctory debate during the last hours of an already overburdened Congress. It is thus that the public is kept in ignorance of the actual and true cost of government. The menace of this (*Continued on page 27*)

New IDOLS for the Gallery

The Slashing Game

By H. G. SALSINGER

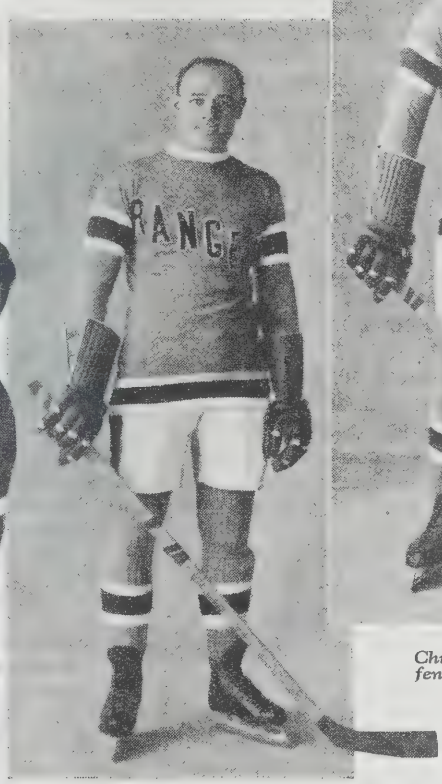
Happy Holmes, the crack goal keeper of the Detroit Cougars.

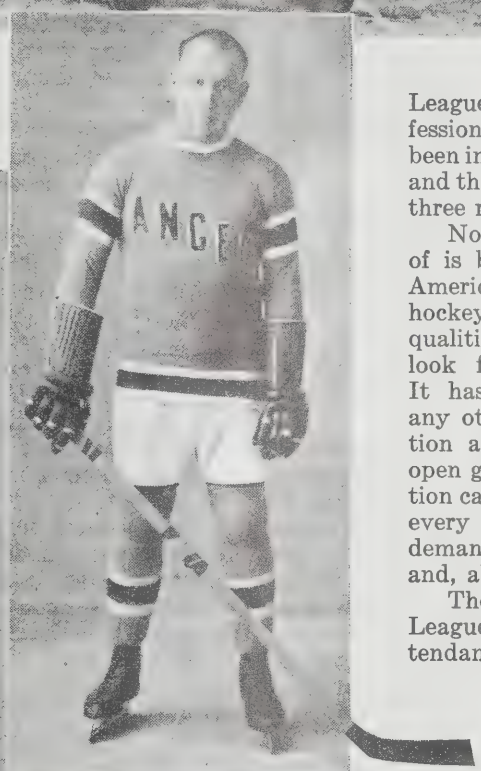
WHEN the game first started they called it shinny on the ice, but a wide span of sport progress separates what nce was shinny on the ice and what is e hockey today.

Ice hockey as known to Canadians nd Americans, and field hockey as layed in England, both grew out of ie old and altogether familiar shinny on ie ice, and the North American game as developed into the fastest all competitive sports.

The United States has rrendered to the lure of ice ckey. It has been played this country a quarter of century, but in a modest ay until a few years ago when the Yankees suddenly became aware of what Canadian sportsmen had appreciated decades ago. Today the Northern States are turning to ice hockey. The number of teams have more than doubled in twelve months. The National Hockey League, the leading professional organization, has been increased to ten teams and there is talk of two and three rival circuits.

elson Stewart. He is obably the best center in in hockey. He plays or Montreal Maroons.





Ching Johnson and Taffey Abel, the defense combination of the New York Rangers. Their combined weight is 428 pounds.

No game that we know of is better suited to the American sports taste than hockey. It carries all the qualities that Americans look for in competition. It has more speed than any other game, more action and color. It is an open game where competition can be followed closely every second of play. It demands courage and skill and, above all, team play.

The National Hockey League is breaking all attendance records this season. Americans are meeting new brilliants in the sports firmament. A new crop of sports idols has come into the American scheme of things with the sudden grip on popularity that hockey secured.

Among the athletes that have caught the American fancy are Nelson Stewart, Punch Broadbent and Babe Siebert of the Montreal Maroons; Howie Morenz and Auriel Joliat of Les Canadiens; King Clancy, Si Denneny, Frank Nighbor and Alec Connell of Ottawa; Happy Day, Bill Carson and John Roach of Toronto; Sprague Cleghorn, Eddie Shore, Carson Cooper and Eddie Oliver of Boston; Ching Johnson, Taffey Abel, Bill Cook and Frank Boucher of New York Rangers; Billy Burch, Red and Shorty Green and Norman Himes (*Continued on page 24*)

I Heard It *With* My Own Ears

Some Ghosts *of* Sound *That* Haunt *the* Average Man

By DONALD A. LAIRD

Illustrated by RUTH THURBER

HAVE you ever been awakened in the middle of the night to hear footsteps downstairs? You have never been able to find anyone prowling around the house, yet from time to time these footsteps are plainly heard.

Can it be ghosts?

Can it be ghosts?

A few days ago I asked an athlete in one of my classes to sit on a small platform at the front of the class. He was blindfolded. I snapped my fingers about three feet in front of his nose. With his forefinger he pointed to the direction he judged the sound to come from. He pointed straight behind him!

When I snapped three feet from his right or left ear he always had it right. But when the sound came from straight in front or straight behind half the time he did not know where it was from.

You and I would have been wrong just as many times. In spite of the confidence we have in our ability to tell whether a sound is in front or back we are able to do so with no greater accuracy than pure chance. To be sure, if we hear a clatter of hoofs and do not *see* horses in front we judge them to be back of us. Blindfolded we would be dead wrong half the time. Many things we think we hear, we are really seeing.

A noted criminal lawyer who knew this was attorney for the defendant in a murder case some time ago. The evidence was circumstantial. One witness testified to having heard two shots from a store across the street from his home.

The defense attorney had the witness close his eyes. Then the attorney snapped his fingers behind the witness' head. The witness said the sound was directly in front.

'Gentlemen of the jury,' the attorney said dramatically, 'are we to believe this witness when we have just seen that he is utterly unable to tell whether a sound is in front of him or not? Would you take a human life on testimony from such an unreliable witness!'

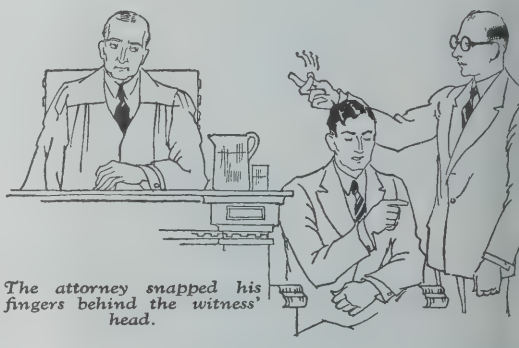
He completely discredited the witness, although probably no juryman could have done better in locating the sound.

The ear can sense direction only indirectly. It has not the ability of the eye in this respect. When a sound is slightly louder in our left ear we judge it to be toward our left. If very loud in the left ear and correspondingly faint in the right we estimate it, unconsciously of course, to be straight off our left.

But a sound in front is of equal intensity in both ears. It sounds the same as a noise from behind—unless we can see ahead of us the thing that is making the sound.

One of your ears is probably less keen than the other. This makes t sounds directly in front of you sligh louder in one ear. As a result they heard to be off-center toward the kee ear. A startling demonstration of t can be made at home. If someone o thirty is blindfolded in a room wh there is a telephone, and whirls arou so as to lose his bearings, when phone is rung—an alarm clock may substituted—he will consistently one to three feet to the right or l of the bell. If the bell is judged m to the left than it really is, then left ear is keener—the right is getti deaf. Since most people above thi have one ear growing deaf practica all sounds are heard as being in wrong place.

During the war once every weeks I had to help test the ear balan of sailors in training to find 120 w



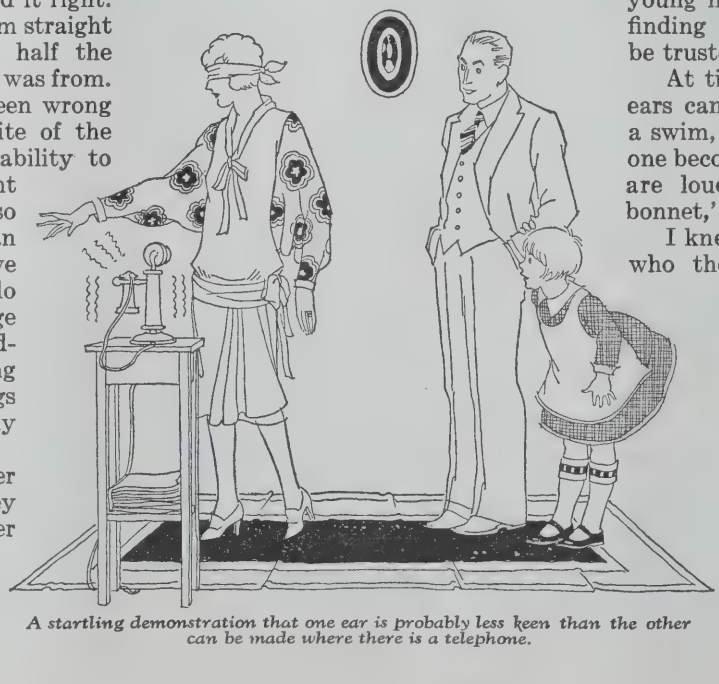
The attorney snapped his fingers behind the witness' head.

perfect balance to be sent to the su marine listeners' training school New London. Often several thousa young men had to be examined befo finding a quota with ears that cou be trusted to guard life.

At times pulsations of blood in t ears can be heard. Buzzings, as aft a swim, are also heard sometimes. one becomes older these internal racke are louder. It is not 'bees in t bonnet,' but is right in the ear itself!

I knew a superstitious old Scotsma who thought these voices inside h head were elves and fairie Another, a young ma thought the buzzings we caused by enemies trying to g his thoughts under control wireless buzzings. He w slightly unbalanced.

London residents during t war were thrown into a Ze pelin panic from time to tim by a sensitive person notici the buzzing in his ears a running through a corrid crying 'air raid!'



A startling demonstration that one ear is probably less keen than the other can be made where there is a telephone.

MR. FORD'S PAGE

OF THE DEARBORN INDEPENDENT

AS THE seaman knows that his ship cannot escape the parasites of the deep, but will need overhauling at times to rid it of obstructive and destructive barnacles, so should captains of business know that the ship of industry suffers likewise and also needs a timely overhauling. And this should be done before the need for it presses hard, because then it is often too late. Business, however, is not interested in the science of itself; it cannot be halted to take stock or to examine itself at a moment when all the parts are functioning—the slightest clink of coin calls it away. Hence most of our business studies by practical business men are made during times of stoppage or breakage, neither of which is profitable and both of which are preventable. Business is not yet scientific; in its self-regarding moments it is not even efficient.

Foresight is better than hindsight, but even hindsight is better than blindness, and if it could be said that American business was profiting by its past mistakes, the case would not be so serious; but it cannot be said. Clink the coin, stir the market, and American business is away hotfoot on the same mistaken principles as before.

This, of course, is not true of all the elements which go to make up business, but only of the profit-conscious elements. The chemists of the shop laboratory profit by mistakes and continue to learn from normal conditions. The managers who lay out the course of the work make constant use of foresight in the service of greater efficiency. The designers, the engineers who work continuously for a betterment of the product—all these are exempt from the general criticism. They are raised above the common errors by their devotion to a certain ideal of service. To them a business is a channel of service; to the others a business is a shovel or a scoop for the intake of dollars. A shovel or a scoop is an excellent thing, whose inherent usefulness cannot be changed by base misuse; and so business is a noble thing though men regard and use it as nothing but an implement to rake in the muck of money.

Business for its own sake is not a sufficient philosophy and too susceptible of abuse to be safe. Certainly it does not assist its devotee to interpret the graph of business as it rises and falls and rises again. For if business is primarily the supply of human need, then when human need is supplied, the purpose of business is for the time fulfilled. When everyone has clothespins enough, there is not likely to be very great excitement in the clothespin market until some future washing day.

THE normal course of business has breathing spells. They are turned to good or ill account according as we recognize or interpret them. They are necessary to the health of business, to its recuperation from excessive effort and to its preparation for better future service. To ignore these periods by large doses of 'dope' which produce a false stimulation in business is to invite the very ills which wisdom would avoid. The periods of business are not normally Prosperity and Panic; the so-called 'cycles' of business are not 'boom' and 'crash'; these are the cycles of business error. Normal periods of business are like breathing, inspiration and respiration, or like waking and sleeping—protective of continuity.

But this no longer satisfies; the believer in business for business' sake insists that clothespins shall lead the market every day and in every way, and not only the market of today but a tremendously greater market of tomorrow, with a round world singing praises to clothespins all the time. The symbol of progress must become a clothespin! We must paint on the skies the merits of our clothespin! All politics, science, religion and art must turn on the clothespin as on a pivot! Of course, it is sheer foolishness to pour gasoline on the market, to make it flare up, after the clothespin want is for the moment supplied.

If, however, there is somewhere a famine of that useful article; if somewhere families are in distress for lack of it, and business is slackened for want of it, and supply cannot be made for want of proper distribution, or business will not move for lack of equitable prices, then it constitutes a direct challenge to the masters of clothespins. It is part of their business—the biggest part—to give service. As long as there is service to be given, the limits of no business are reached. As long as there is service to be improved, the possibilities of expansion are present.

Two normal periods of rest in business are, first, when the supply is sufficient for the time, and, second, when the progress of the concern represents the utmost vision of its managers up to the moment. These breathing periods come naturally, and should not be described as 'panics.' A man is not in a panic because he slows up for an afternoon. American business has as little scientific knowledge about panics as it has about prosperity, and if it had more scientific knowledge about prosperity, there would be need of less experience with panics. But this much should be clear, even to professional economists, that a breathing spell portends nothing ominous, is indeed a normal, wholesome thing, and not to be destroyed by the injection of false stimulants into the situation.

That is what happened ten months to a year ago in American business—not recognizing the normal easement which came, the managers began to treat business with 'dope.' Business seemed to 'pick up,' became a little wilder in the eye; its motions were attributed to increasing strength instead of unnatural and harmful stimulus. The very statistics of the period will have to be revised, because we cannot reckon as normal respiration and pulse the figures which 'dope' puts on the business chart.

United States in China

IT DOES not appear that American diplomacy toward China differs from that of other nations. It rather appears to be a copy of that of other nations. And this is not necessarily an adverse view of it. Yet since our State Department seldom attempts to instruct the public in foreign affairs—and when it does, seems singularly unfortunate—the notion seems somehow to have gone abroad among the people that American policy with reference to China was vastly more generous and civilized than that of other nations. It was even stated that President Coolidge would not send troops to China, yet next day Marines were on the way.

Perhaps no other country has ever shared so general a friendship on the part of all the world, as has China. Among civilized nations she has had no enemies. The riches and knowledge and service of civilization have been laid at her feet. Western learning has been freely shared with her sons. The Chinese have been well received in every country whither they have gone. They have never migrated in such numbers as to become a 'problem,' and on their higher levels they show kinship with other peoples on their respective higher levels.

But within her own borders China has always been the victim of unrest. The unity which should mark a nation under a central government has not obtained in China; the various parts of the nation have oftener behaved to one another like enemy nations. The sources of trouble have been internal. To say that China's trouble is due to foreign influence is like saying that American difficulties are due to Chinese influence, since there are perhaps fewer foreigners in China than there are Chinese in the United States and Canada. Where foreign industry has been at work, doubtless it has fallen far below the best standards of American industry, but so have the Chinese 'towns' of New York and San Francisco; the point being that in neither case has the matter been adequate to cause a revolution.

If China has not completely ruled her own domain, it is simply because she has not, and therefore it remained for someone else to do. If now she wishes to rule her own domain, she may, but if she undertakes it, the rest of the world will see that she performs it. The whole question hangs on the doubt whether China knows what she wants and whether she can swing it when she gets it. In the meantime, no manner of justification can be found for violence toward foreigners, and this she must be made to understand. It marks a barbarous people. If China wants to enter the modern world, she must obey its rules. If she wants to get out of all contact with the modern world, she should be permitted to try; she will be the first to offer to come back again. After all, what the rest of the world is experiencing is the effervescence of Western learning and Western ideals in Chinese minds.

Use Straight Reason

IT IS possible to become so exasperated over local crime conditions as to propose and work for capital punishment. But it is not possible, in cool moments, to admit the argument that it is a deterrent of crime. It is only a means of satisfying the temporary irritation of the public by turning its mind away from the real problem. No argument favoring capital punishment will pass the test of logic or fact. If the current journalistic argument is right, why not apply it this way: The police of London are unarmed; London is the largest city in the world and has the lowest crime rate; therefore, let the police of New York, Detroit and Chicago be unarmed. Except that this argument is superior to the newspaper ones, for it *is* a fact that unarmed police and a low crime rate exist in London, whereas it is *not* a fact that states which have capital punishment have the lowest crime rate. New York and Illinois have the highest. Therefore, capital punishment is not a deterrent of crime. And yet, serious writers are found who will encourage the people along a wrong line of thinking, and not present the entire matter as intellectual honesty requires.

What's the Poor Farmer to Do?

THE 'annual' *Agricultural Outlook* issued by the United States Department of Agriculture states that the 'maximum income to cotton growers next season would likely result if production were eleven million bales or a little less.' If therefore an acreage is planted that normally would yield eleven million bales, and precautions are taken to exterminate the boll weevil and other predatory insects, the result might be a fourteen-million-bale crop. Prices then would drop and the farmer would be penalized for his success against the pests. Either way, boll weevil or big crop, he loses. But the United States report does not assume any war against the weevil; he is to be assumed; which leads to the conclusion that the boll weevil is the real savior of the cotton growers, and the monument erected in its honor was not so far wrong after all.

The report continues with reference to corn. 'With no positive indications of increased demand for the 1927 crop, and with the probable acreage increases in the South, an average yield would result in another year of low corn prices unless acreage in the corn belt is reduced from 10 to 20 per cent.' We must conclude from this that only disaster would result if any considerable substitu-

tions were made of corn for cotton. Rice acreage reduction 'appears advisable.' Onion and bean acreage 'should be reduced.' 'Guard against overplanting,' is the admonition to the potato growers. Cantaloupe acreage 'should be cut,' watermelon acreage 'should be reduced.' The tobacco growers are urged to 'guard against overproduction.' *Now just what is the poor farmer to do?*

An organized government campaign to reduce food production is an artificial and dangerous thing, because, as in this instance, it is always empty of the counsel and wisdom which secures to the people the fruits of the earth. Reducing food production is the wrong angle of attack. Reducing arbitrary profit production by those who do not raise food, but speculate in it, is a more promising approach.

C. C.'s Common Sense

NICHOLAS MURRAY BUTLER turns from sage to prophet and foretells the nation that Coolidge will not again be a presidential candidate. He bases his prognostication on what he calls Coolidge's common sense. This is too thin a basis for so important a claim. Not that Mr. Coolidge does not possess common sense, but each man's supply of that indefinite quality functions differently. Men of equal and surpassing common sense are found on both sides of great issues. Washington had common sense in refusing a third term; Roosevelt with equal common sense attempted to get a third term. In matters like these it all depends on whether the common sense of the 118,000,000 Americans tallies with that of the aspiring candidate. Sometimes it does, sometimes it does not.

Mr. Coolidge has shown that he can view the same question in several lights. Once he determined that local authorities would be used as Federal forces in enforcing prohibition, a position from which he noiselessly removed himself almost as soon as he had taken it. No doubt a kind of common sense could be found in either attitude. Again, he followed the dictates of what must have been his common sense in working for American adherence to the World Court; his common sense apparently has since led him to drop the Court. He also favored, as a common-sense measure, a tax rebate to the people; but Mr. Mellon has succeeded in having him accept the opposite common-sense view of that matter.

So that Nicholas Murray Butler, in predicting that Calvin Coolidge will not be a candidate, may by accident be proved to be a good guesser, but the facts make him a poor analyst.

Wanted—Honest 'Wets'

THERE is one way to get rid of Prohibition, and only one way—amend the Constitution, by removing from it the Eighteenth Amendment.

The fact that the nation has never removed an amendment which it once deliberately put in (the Eighteenth being the most heavily supported of any amendment ever made) does not alter for a moment the fact that if anyone wants to be rid of Prohibition the way thereto lies through the Constitution.

Electing a wet President will not do it.
Electing a wet Congress will not do it.
Electing a wet Governor will not do it.
Electing a wet Mayor will not do it.
Electing a wet Dog Catcher will not do it.

No one who can be elected has anything whatever to do with Prohibition, except to take a solemn oath to uphold the Constitution of the United States which contains the Eighteenth Amendment.

So what is the use of politicians, whether candidates for President or for alderman, trying to mislead the people?

What is the use of States holding elections as if 'wet' and 'dry' were still an open question?

Is there not some one politician, preferably a wet one—is there not some newspaper, preferably a wet one—that will plainly tell the people that the only way to get rid of Prohibition is to change the Constitution, and that the way to change the Constitution is to have Congress submit an amendment to the States for their ratification?

We believe the question could be definitely settled if this were made known. It is an extremely simple bit of honesty which many wet political tricksters may soon regret they have not used.

We believe also that the dry element in the country would be agreeable to an early vote of the States as to whether an amendment nullifying the Eighteenth should be submitted.

Ladies' Department—State Prison

THE South Dakota Prison, Sioux Falls, issues a little publication. One skims it through, from the 'Walled City Briefs,' through the prison-made philosophy, to the jokes, checked at times by an item such as this: 'Additional Books. H290a Teachings of Patriots and Statesmen on Slavery. H892 King Albert's Book. H131a Memorial Addresses on Life of Garfield, by James G. Blaine.'

Think of that for a month's addition to a library! Plainly offcasts from a garret. But it gives an uneasy glimpse of prison life which many a more pretentious exposé could not achieve.

And then we arrive at 'Notes From the Ladies' Department,' decorated at the top of the page by two girlish heads.

> 'Our family has increased during the month. We welcomed Beth, our new arrival, into the overalls and socks brigade, as she came in time to rescue us from being entirely flooded by these delicate garments.'

Heaven knows the reason for the arrival, but after all the publicity and shame, it was Beth being welcomed by the group.

Thus in 'The Ladies' Department' of the State Prison the drama of life flows on, not unlike it does on the Avenue, except that on the Avenue the day of release, though often looked for is seldom seen afar as a fixed calendar day.

The spring peeper rarely encounters freezing temperatures among roots at sources of springs.

When 'Wee Tim'rous Beasties Take Their Winter Sleep

By S. F. AARON

Illustrated by THE AUTHOR

During freezing periods, snakes often hide beneath stones, escaping contact with ice but experiencing the lowest temperatures.

MANY living things, both vertebrates and invertebrates, are active only during warm weather in the temperate zones. In what manner most of them spend the winter months has very generally been overlooked. Though the fact of hibernation is commonly known, its specific and peculiar processes seem to have received little study.

Why some warm-blooded creatures choose to sleep throughout the cold periods and others remain active, why some hibernate for longer stages, going into winter quarters and emerging in the spring earlier than others, is not very fully understood—at least further than that some can utilize food in greater quantities and others require it oftener. This may depend upon the functional peculiarities of the animals or the nutritive value of the varied foods and it would seem to have an essential relationship to the fact that strictly carnivorous animals do not hibernate.

Though quite too hypothetical there may be some connection with the relative heat units and energizing qualities of flesh and the slower processes of digestion and assimilation of those animals that make a night of the entire winter and that fatten on a vegetable diet.

It might be inferred that an animal depending wholly upon meat could not store up enough body fuel to enable it to do without food for a considerable period. The winter sleepers are mostly herbivorous, or largely so, as the woodchuck, hoary marmot, the so-called prairie dog, the chipmunk, the western striped squirrel, and even the bear. The exceptions are principally negative; there are strictly herbivorous animals that do not hibernate, as the rabbit, the beaver, the pika or little chief hare, the porcupine, and nearly all mice. But with regard to the wintertime activity of the flesh eaters there is only one exception, the skunk, and it by no means hibernates in the stricter sense of the word, never indulging in a long and continuous sleep. On milder midwinter nights following a thaw, skunks may be seen wandering about even in the deeper snow.

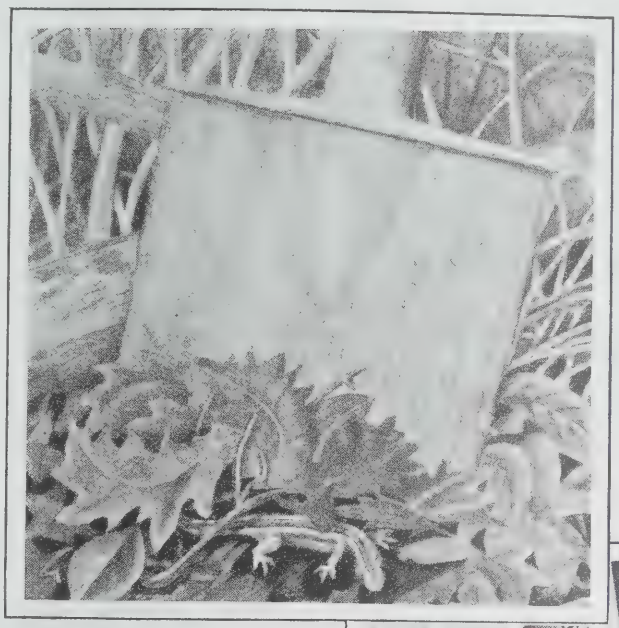
There is some difference in the intensity of the winter sleep among warm-blooded animals. The woodchuck, prairie dog and other marmots, and the striped squirrel lapse into a condition of lethargy akin to tot insensibility from which they are som times wakened with difficulty. It interesting to surmise what happe when a bloodthirsty enemy, eve though much smaller, takes the notio to attack a semi-comatose victim, a for instance, the weasel on entering th burrow of the woodchuck. Does th memory of how valiant the latter ma be in summer deter the killer, or ma not the marmo regain its sens under the pain attack, and quic ly enough to d fend itself?

The chipmun and striped squi rel might exper ence something the same with th shrew, which ha little fear of an thing and an i satiable thirst f blood. The bea is one of the lighte sleepers, is easil aroused at almos any time, and i some cases whe food is scarce for other reaso not so apparent does not hibernat at all, and the are not a few authentic cases on recor of bruin's prowling about during th coldest weather. The writer, campin with a trapper in the Pennsylvani mountains nearly all of one January average temperature, found the track of a medium-sized bear in the light sno every morning within less than fift yards of our pole shack, but, althoug tracked to a swamp and waited fo bruin was not once even glimpsed The skunk might be the soundes sleeper of all; few, if any, enemie would care to risk tackling it even whe dead.

It is probable that the majority bats, both species and individual migrate as do birds from norther localities where the cold is prolonge It is known that the red and hoar bats make long northern and souther flights, but it is also known that certai species hibernate, retreating to cav

and old cellars beyond the reach of severe cold and storms, hanging up in rock fissures, small and deep holes and cracks in trees, in church steeples, crannies of dwellings and barns and behind long-closed shutters where only the stored warmth of their tiny bodies protects them from the cold. In such hiding places they are practically safe from enemies, for only reptiles too small to harm the sleepers can enter these narrow places, and even should the temperature permit snakes to be active they would not attempt to climb where the wings of the small mammals can take them.

No birds hibernate, though not many generations ago reasonably intelligent people believed certain swallows and the chimney swifts buried themselves in the mud of rivers and in the sands of the seashore, thus accounting for their sudden departure. Even in this day of scientific elucidation the same notion is held by many ignorant and stubborn folk. It is the more inexcusable because of the fact that these birds are among the few passerine species that migrate almost solely by day, their comings and goings and the partial progress of their flights being not difficult to witness.



Nearly extreme cold reaches the woodland salamander a few incher below the surface of the leaf carpet.

Like the shrews, moles and certain mice, the body temperature of birds is too high and the digestive operation too rapid to permit them to do without food for lengthy periods, and in almost all cases seeds and insects are so readily procured throughout the winter as to allow and compel continued activity. Moreover, the storage of fat sufficient for hibernation might make flying difficult, though this argument weakens when the bats are also considered. In every case nature chooses the course of least resistance, and migrating to areas of ready food supply, even to the mid-winter woods of the Northern States, may have been originally a narrow choice.

Among the so-called cold-blooded vertebrates—the reptiles, batrachians and fish—hibernation is the rule. The exceptions are eels, salmon, certain catfish and perch that migrate to the sea, lakes or deeper rivers. All the reptilian class hide away and become inert in places chosen more for their inaccessibility to enemies than as affording protection from cold; thus we may find snakes of many kinds, northern lizards, as the skink and swift, turtles and such batrachians as the toads and highland salamanders, hibernating beneath stones, fallen tree trunks, rotting stumps, masses of leaves and in loosened woodland silt where frost readily reaches them. A usual winter concealment of the common garter snake is beneath a flat stone within a few inches of the ground surface that may be frozen to a depth of more than two feet.

Many species of semiaquatic salamanders, frogs and turtles seek winter quarters in spring swamps and near the spring heads of streams where the normal temperature of the flowing water prevents them from freezing; they burrow beneath marsh-grass clumps, into depths of sand washes and under the roots of water-loving trees.

Without an exception the invertebrates, including the great subkingdom of arthropods, the mollusks, the true worms and all the lower forms of animal life, in every form of their development, simply experience a suspension of animation from the effect of cold. Compelled to hibernate, they do so under specially developed conditions or in generally well-chosen hiding places, the purpose being almost solely to escape their enemies and the crushing effects of ice.

Invariably during the developmental stages or prior to the completion of the natural propagating functions of insects when mature, the lowest temperatures have only the effect of producing and sustaining a comatose condition from which they readily revive when subjected to temperatures of 34 to 45 degrees Fahrenheit. With eggs, larvae or pupae, though becoming stiff and apparently frozen, there is always a return to normal activity, no matter how low the thermometer may register.

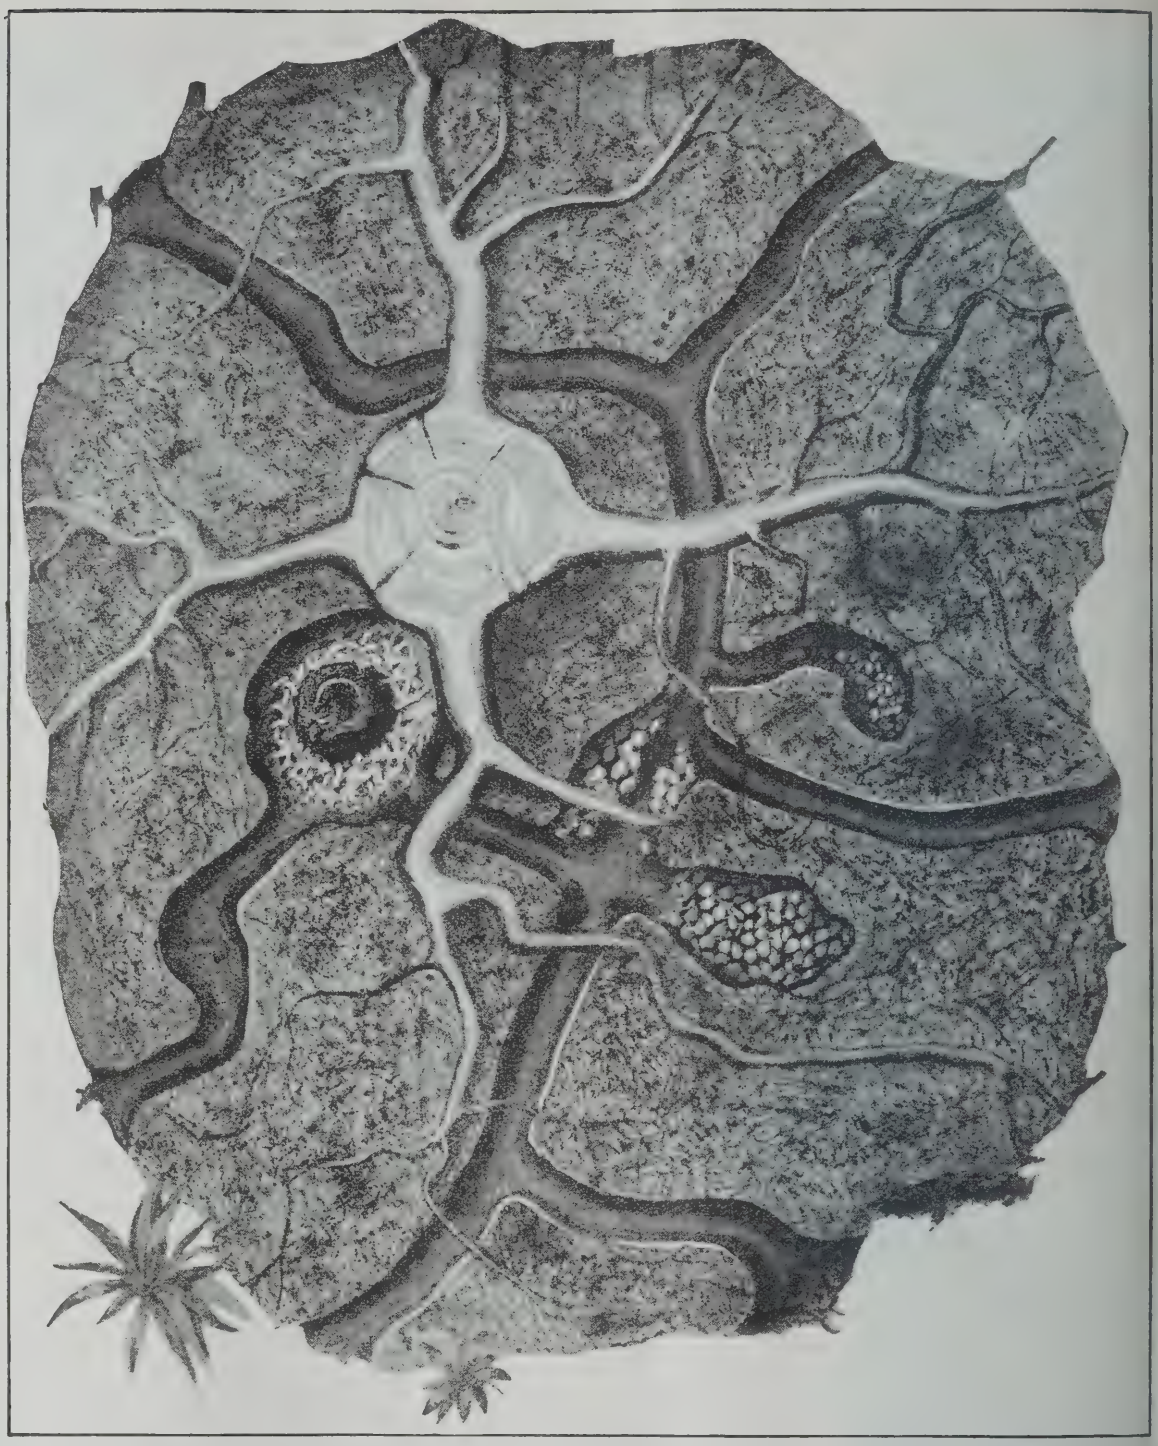
If this survival and revival were not possible there would be no insects nor their allies, the spiders, crustaceans and centipedes; any ordinary winter would end them. As precisely as nature has developed innumerable characteristics in colors, contours and habits for the protection of species, there has come about a constituent condition

Section of fallen tree limb with borings of long-horned beetle larvae, one having plugged itself in where it spends the winter inactively. Ants and wasps commonly use these discarded borings for nests.

in the chemical make-up that prevents the blighting effects of frost.

But not all insects revive, either by artificial heat or when come the warmer days of spring. In an ant burrow, split open with an ax and disclosing several hundred black and apparent corpses, it will be observed that only about fifty per cent of the inhabitants come to life; those that are dead have lived their allotted lives, their deaths possibly hastened by the cold. Had the weather remained warm they would have died anyway very soon and been carried away by their fellows.

This holds good with most adult insects. Out of hundreds of individuals and scores of species collected by the writer in midwinter and brought into the house, far more than half of them quickly revived. Of scores also of larvae and pupae brought in all have revived. Of many hundreds of insect and spider eggs brought from the outdoors in winter, or when discovered in the autumn, exposed to the cold for a time, all have eventually hatched in the spring.



Excavations beneath the roots of a stump, disclosing a chipmunk curled among soft grasses in winter sleep. Close at hand are a latrine, storage chambers containing nuts, grain and seeds, and a dump for shells, stems, and so forth.

Environmental conditions affect these natural revivals. Of larvae, chestnut worms which cut their way out and burrow into the earth, there to transform into beetles, wood-boring beetle grubs split harmlessly from their snug cells, the white maggot-like young of mud dauber wasps and certain caterpillars of moths that incase themselves in the pupal cocoons before becoming *chrysalides* all revived, but only a limited number of times when alternately exposed to cold and warmth. It may also be observed that in warm weather, when these insects are thus disturbed, they commonly die.

Again, when many adult insects are removed from their natural retreats and repeatedly frozen and thawed out, if it can be so called, they succumb in time; it is, however, quite likely that placing them in limited artificial quarters influences this, as it will in warm weather also. It suffices, though, that we can readily find in hidden recesses scores of insects that are alive in the late days of winter and early spring. During winter thaws, with the thermometer at about 34 degrees Fahrenheit, many insects will be found crawling, or even flying about, these largely becoming the prey of winter birds and the shrews.

Perhaps most hardy among the arthropods are the spiders, at least when not fully grown. The temperature may stand as low as 29 degrees Fahrenheit and these little fellows suspended in the webs in places where they are not found by hungry enemies are by no means inactive. At such times I have dropped them on the snow and watched them crawl several feet until reaching the first object offering shelter.

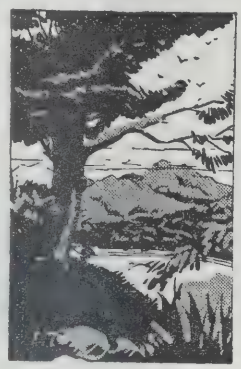
They will revive after alternate freezings and thawings any number of times and artificial conditions affect them not at all.

The HOW of SNOW-BLINDNESS

By F. J. CLIFFORD

THE Cascade Range lay winter-clothed. Ten to fifteen feet of snow gleamed blue-white on the broad flanks and craggy tops. William Robinson, watchman at the Bonita mines, stopped at the divide to rest his pounding heart and breathe deeply of the thin air. It was a hard climb from the mines to where he stood. He was making his monthly trip for mail at Mazama thirty miles away.

The sun showed signs of breaking through the light clouds. Automatically, the watchman reached in his pack sack for the smoked glasses that all trained mountain men carry. They were not there. And they were not in his pockets. Then he remembered. He had worn them a few days previously while shoveling the snow from the mine buildings and had thoughtlessly laid them on the cabin window sill.



Undecided, he glanced from the hazy sun to the weary distance back to the mine cabin. Far down the mountainside was the first patch of timber. Could he reach it before harm came to his eyes? He decided he could, for where there was wood there was protection.

He regretted his decision, however, before the distance was half covered. The clouds opened and drifted down to the horizon, leaving the sun a blazing ball above. It was late February and the sun, climbing higher and reflecting its light on the frozen snow which had taken on none of the smudginess of springtime, made it doubly dangerous for unprotected eyes.

Realizing this, the traveler tried peering through narrow slits between his fingers. His reward was a tumble over a snow-hid cliff. Dazed considerably, he crawled out from the deep snow, made tight his snowshoes, and hurried on. Grimly, he noted smarting pains quivering about his eyelids. He stopped and tried to discover some piece of black cloth lining to substitute for glasses but could find nothing.

At last the grateful shadows of the wood were reached. He paused a moment to rest his smarting eyes. Then hurriedly preparing kindling from dry black-pine branches, he reached for his waterproof match safe. It was not in his right pants pocket where he always carried it—nor was it anywhere on his person. Then he remembered the tumble over the cliff. That was where he lost it, for he recalled filling it with matches when leaving the mine cabin.

The absolute certainty of it was crushing. He peered out between the tree trunks at the shimmering whiteness—stark whiteness that stabs like a million tiny knives. As the sun rose higher it would be more intense. There was no other choice. He—had—to—go—on.

A roaring sensation pounded in the back of his eyes. Water streamed from them until he could scarcely see. He longed to rest them under shadowy trees. But a grisly thing drove him on. It was the thought of Dead Horse Point. There—*he had to have eyes to see.*

In summertime the trail at that place is dangerous enough. Pack horses have lost their footing there or have become frightened and tumbled hundreds of feet to death below. It earned the name. With snow now covering the beetling cliff to a glassy, steep evenness, the traveler must approach it at one spot only. Above or below might be fatal.

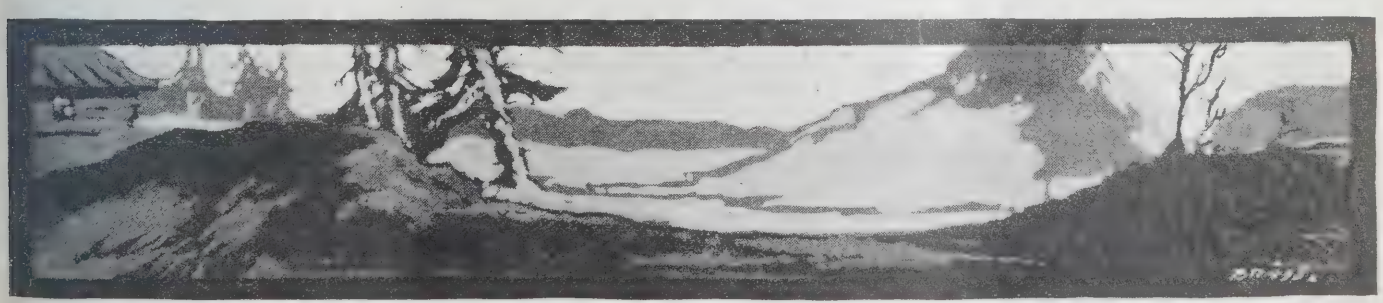
Pushing on, he closed his eyelids at times. But they seemed no more protection than tissue against the pricking light. He covered them with his hands and at intervals with his finger tips, and pulled the watery, quivering eyelids apart to peer ahead. Each time the light stabbed to his brain.

GROPING along—stumbling over rock and projecting tree stubs—he floundered blindly, conserving his failing sight for Dead Horse Point.

He gained the mountainside—clawing and scrabbling along the snow-filled trail. Forcing apart his resisting eyelids, he searched out the one safe pass. Creeping carefully, snowshoes under one arm and heels gripping the ice-like snow, he edged by the treacherous place. He tried once more to locate a bent pine that marked the nearest safe place to leave the mountainside, but his overtaxed vision flickered a little, and faded to a reddish haze.

Protecting his eyes with a free arm, he slithered to the valley floor. Then keeping the roar of Rattlesnake Creek to the right he headed for the west fork of the Methow River.

Robinson does not remember all he did when the old log cabin was reached. The darkened interior was a great relief, and hot and cold applications of wet towels comforted his throbbing eyes. And before the week had passed, wearing heavily darkened glasses, he was pushing pack over the mountain range again to his duty at the mines.



As the clock struck four, and the tenth policeman was being offered a drink, John walked in, with a bedraggled, but triumphant Emmeline

The Adventure of the

By HUGH WALPOLE

Synoposis

John Borstal Clay is a boy of twelve who has a powerful imagination. He is an orphan and has been adopted into the family of Fortescue Bumpus, his father's brother. The family, in addition to John's uncle and aunt, consists of two little girls—Emmeline and Gertrude—and a boy, Percival. The habit of sizing things up and asking incisive questions, which John possesses in a remarkable degree, makes the Bumpus family very unhappy, and in despair Mr. Bumpus seeks the assistance of the agency for the removal of bores, with the object of diverting the boy's attention from the Bumpus family into other channels. John is accordingly invited to the house of one of the members of the firm, where he will be under observation to ascertain if a remedy can be devised.

PART II

THAT was a strange night when John came to stay. I shall never forget it. I lived in an old house in Westminster, just off Barton Street, under the very shadow of the Abbey—one of those old houses with crooked staircases, low-ceilinged rooms, and boards that creak at every step.

John arrived in time for an early dinner, and we went off to the pantomime at the Hippodrome, which that year had lasted from Christmas right over Easter. I need have had no fear as to the reality of John's youth. It did one's heart good to see that little figure rocking about in his seat, laughing and shouting and crowing with that peculiar cockerel noise made by small boys when they're very happy. Nellie Wallace had only to appear for him to go into ecstasies, and when Lupino Lane vanished in and out of his numerous trapdoors, John was doubled and twisted with delight. Walking home afterward, as he said he preferred to do, he remained pure boy. 'Do you think,' he asked me, in that funny, hoarse voice of his, 'that Miss Wallace is really like that at home? Is she as ugly, do you think?'

'No,' I said, 'she's probably very beautiful. She is one of the few women in the world whom it pays to pretend to be as ugly as possible.'

'If she was more ugly still,' asked John, 'would she get more money?'

'Probably,' I answered.

'And if she was more ugly than that?' asked John.

I saw that there was no end to the heights and involutions of this inquiry, so I changed it to another one.

'Did you like the princess?' I asked him.

'Oh, yes,' he answered. 'She's the one I've seen the advertisements about, with all her teeth in a row. Don't you think it's a pity,' he continued, 'that when anybody is going to be a princess in the evening, she should be an advertisement in the daytime?'

'I really haven't thought about it,' I answered. 'It's very difficult for anybody to be a princess all the time.'

'Why?' asked John.

'Oh, I don't know,' I said; 'it's very exhausting.'

'Why?' asked John.

'Because you have to sit still, and be very proper, and dressed in your best.'

'Why?' asked John.

I am glad to say that at that moment we arrived at my Westminster home.

Now, as soon as we entered my old house and found our way up the dark staircase, John became another person. I cannot describe it better than by saying he was like a dog who sniffs a good smell somewhere close at hand. He did literally go round my sitting-room sniffing at the walls. He poked his small nose into every possible corner, and suddenly, to my amazement, flopped down on the floor and laid his ear to one of the boards.

'Good Heavens!' I said. 'What are you doing?'

'It's funny,' he answered, getting up slowly, not in the least disturbed, 'it's old. It's been here hundreds of years. Lots of things have happened in this room.'

IMAGINATIVE CHILD

'Yes,' I said, 'they have.'

'Nothing's ever happened in Uncle Henry's house,' he said. 'Not to Aunt Mary, nor Emmy, nor Gertrude, nor Percival. I hate Percival,' he added reminiscently.

He stood in a funny little way against the hearth, as though he were trying to balance himself on a rocking floor. 'I like you,' he said, smiling. 'Do you think it's wrong not to like Uncle Henry and the others? Because I don't like any of them.'

'No, I don't know that it's wrong,' I answered. 'If you don't like them, you had better go away and live with somebody else. With me, for instance.'

'Oh, now,' he answered, 'it's fun living with them. I can make them ratty in no time.'

'Well, it isn't right,' I said, 'to like making people uncomfortable who've been good to you.'

'They've only been good to me,' he said, 'because they'd be uncomfortable if they weren't.'

'Good Heavens,' I answered, 'how old are you?'

'I'm twelve and a half,' he said, 'by years, but do you ever have that funny feeling, Mr. Johnson, as though you'd been a lot older really, and seen everything before, and knew just what was coming next?'

'I have known that,' I answered speaking to him, in spite of myself, exactly as though he were my age, 'once or twice at moments, but only for a moment.'

'Well, I know it often,' he said. 'At school there's a master who's got a bad leg and he goes limping around. Well, I know I've seen him limping somewhere else a long while ago, and he was all in red and green.'

'Red and green?' I said.

'Yes,' said John laughing just as he had laughed at Nellie Wallace, 'and it was so funny. He was a man everybody laughed at, and that's what he was there for, and he hit people on the head with a balloon.'

I was beginning to feel uncomfortable.

'Well, we won't talk about that now,' I said. 'Only look here, you mustn't do things that make your aunt and uncle unhappy. They've been kind to you, after all.'

'I don't want to make them unhappy,' he said, 'but they're so silly, and if you know that if you do something somebody else'll do something, and then you'll do something again, it's awfully jolly to make them do something.' After which explanation I took him down to the little dining-room and gave him something to eat. In the middle of supper I said—

'You know, John, I oughtn't to be giving you supper. Little boys oughtn't to have supper just before they go to bed.'

'Why?' he asked.

'Because it makes them dream and talk in their sleep.'

'Oh, I always dream,' he said, 'every night. Last night I dreamt that Aunt Mary was a cow, a large, white cow with flowers on her head. It was a funny thing, but I was sorry for her last night. I'm never sorry for her in the daytime. But the one I really hate,' he added, becoming confidential, 'is Emmeline. Isn't it a silly name—Emmeline?'

'Yes,' I said, 'it is rather.'

'I sometimes feel,' he said, 'that I'd like to get Emmy into a corner and twist her hair round and round and round. She's a sucker up.'

'Most girls are,' I answered.

'Why?' said John.

'Well, because they're not so strong and they can't hit back.'

'No, but they can pinch and bite,' said John. 'Emmy does when you're not looking.'

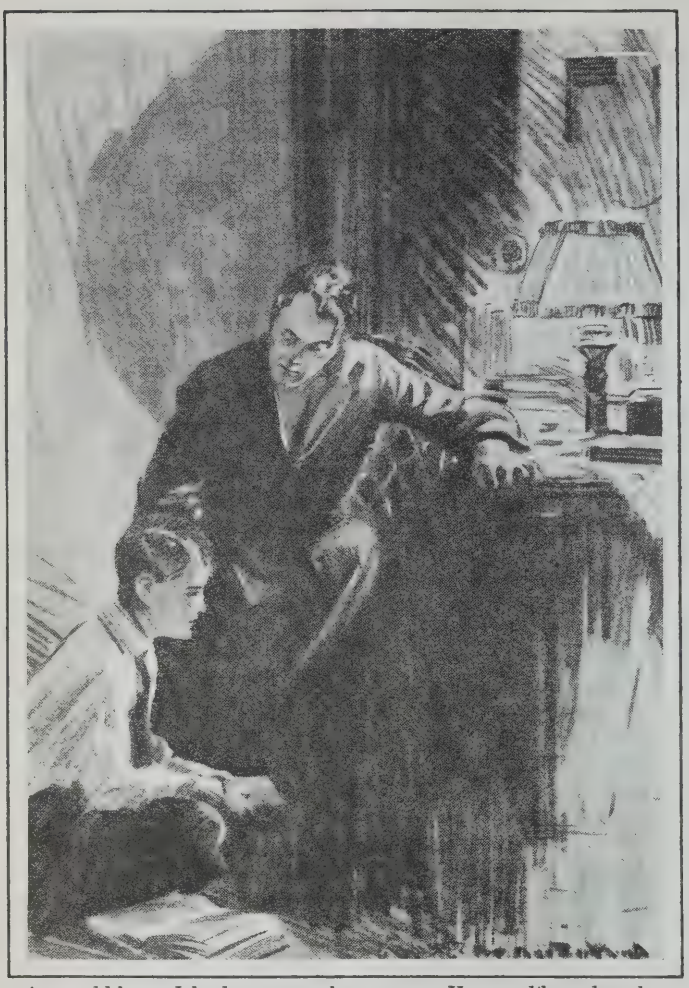
'And why,' I asked, 'do you write them so many letters when you're away? Most boys don't like writing letters.'

'It's such fun sometimes,' he answered, 'to write something that you know they won't expect. It's just as though I were at home with them and saw everything that they were doing.'

'If you didn't think of them any more,' I said, 'and thought of someone else, wouldn't it be a bit of a change for you!'

'You see,' he answered very seriously, as though he were sixty years old, 'I like to have somebody to think about and to do things with—like playing draughts, you know.'

I TOOK him up to bed and put him into a small dressing-room next to mine. He asked questions through the open door all the time he was undressing. 'I say, isn't this fun?' he called out. 'Is Miss Wallace married?' And then, 'Are you married? Have you got any children? Do you go to the theater every night? I saw "Charlie's Aunt" once. I like Nellie Wallace better. Don't you think it's a shame when you don't like cricket that you have to play? Have you got a boiler in your bath? We have at Uncle Henry's. Do you wear a night-shirt or pyjamas? Is this the first time you've ever had a boy in your house? Do you know all Aunt Mary's hair isn't real, and she can take some of it out when she likes?' To all of which questions I attempted suitable answers. I had just put on my pyjamas, and was going to see him safely into bed, when he appeared in the doorway quite naked, and, with the most enchanting smile on his face, cried, 'Mr. Johnson, can you do this?' and was suddenly down on his hands, and started walking, feet in air, across my room. Midway he



At my old house John became another person. He was like a dog who sniffs a good smell somewhere close at hand.

paused and, with a most amazing little chuckle, began to turn somersaults round and round and round.

I've always done my best to curb my too tempting imagination, and I intend, in this case strictly to tell the truth, but something extraordinary occurred in that room as that little naked figure went tumbling from side to side. It was as though a light flashed through the air, the kind of reflection that a piece of glass, turned in the hand, gleams upon the wall. He was not distinguishable as a human body. He was rather a piece of color transmuting the whole place, as though, had I turned off the electric light, the beam would have passed glittering, now here, now there, objects in the room starting from the shadows as he touched them—strangest and most incommunicable of sensations, bringing me back, it seemed, to something that I had once known, promising me some future confirmation of something for which I had always hoped. I sat staring, scarcely venturing to breathe, lest the enchantment should break.

He stopped; with a kind of jerk he was on his feet in the middle of the floor, an ordinary naked smiling little boy. 'You can't do that, I bet, Mr. Johnson,' he said.

'No,' I replied, 'I'm much too old.'

'I'll never be too old,' he answered. He came across to me, held out his small and now very grubby hand, and with an air of infinite age and generations-past courtesy, said: 'Now I think I'll go to bed. I've enjoyed my evening very much.' And to his room he went . . .

One of the most tiresome of Chippet's many tiresome relations was the old Dowager Countess of Pruxe. She was tiresome in all sorts of ways, one of them being that she had lived beyond her time, having had an elder sister who had been danced on Byron's knee (the only drawback to this story was the doubt, natural to any literary mind, as to whether Byron had ever dandled anyone under twenty on his knee). She was more inquisitive by nature than anyone else of her own sex in the British Isles. She was uglier than any human being had any right to be, and she was a bully. No one knew what her age was. She was a very distant cousin indeed of Chippet, but whether it was that she had nothing else to do, or that she really had taken a kind of liking to him, whatever her mysterious reasons might have been, she continued to come of a morning into our little office, sit upright on one of our smallest chairs, looking like an angry, over-painted cockatoo with an enormous Roman nose, and ask us all sorts of questions about our business and private affairs that she had, of course, no right to ask at all. The trouble with her, Chippet said, was that she had too much imagination. We would have rid ourselves of her cantankerous company in no time at all had it not been that we dared not challenge her ever. Old though she was, she could be still a terrible enemy, and having no affection for the truth, and all the romantic anecdotage of very old age, she could ruin somebody's reputation in less time than it takes to poach an egg. She was marvelously vigorous, and always brought with her a miserable-looking, impoverished, pale-faced companion, who snored through her nose so disconcertingly that my only explanation of Lady Pruxe's engaging her was that she added to the general terror of the atmosphere and the old lady's dignity.

She came to the office the morning following John's visit to me, and, while she sat there, in her ugly, husky voice asked questions that Chippet did his best to avoid answering. She vaguely reminded me of someone. I looked at her again and again, but the connection would not come. Where had I seen somebody like her, or, at least, where had I heard that voice before, and who was it who took that curious, almost malicious interest in their fellow-beings' weaknesses? There was something, somebody . . .

However, the increasing difficulty of the Bumpus case soon absorbed my attention again. I could see that the Bumpuses were beginning to regard it with suspicion, even as Mrs. Fleming had once done. Further than that, I could see that Bumpus himself disapproved of my liking for Johnny. I could not disguise that John was a million times more interesting to me than all the Bumpus children put together, and in the eyes of the Bumpus parents it became increasingly apparent that I was encouraging John in all his natural wickedness. Then with dramatic swiftness the crisis arrived. One night I was going to bed, and was standing at my bedroom window listening to the wind and the rain that came beating and howling up the little Westminster street and whirling away round the great walls of the Abbey, when my telephone bell rang. A moment later the trembling, agitated tones of Mr. Bumpus came through to me. 'Is that you, Mr. Johnson?'

'Yes,' I answered. 'What is it?'

'Is John with you?'

'John?' I answered. 'No, Why?'

'Oh, dear! I thought he might be, and Emmeline, too.'

'Emmeline?' I cried. 'What's she doing out at this time of night?'

'Oh, we don't know! We don't know!' wailed the voice at the other end. 'Would you mind coming round at once and helping us? We are in the greatest trouble.'

I DETECTED in his voice the implication that I was considered largely responsible for the catastrophe. Of course I hurried through the rain and arrived to find the Bumpus parents walking up and down their drawing-room literally wringing their hands and making little exclamations like wounded pigeons at Monte Carlo.

'Well, now, what is it?' I asked.

It was difficult at first to discover what it really was, but from the agitation that fell during the next quarter of an hour like a shower about my head, I discovered that John and Emmeline had slipped out of the house about half-past seven that evening, their father and mother being out at a dinner-party and the governess asleep over a novel. No one had discovered their absence until their father and mother went up to see whether they were quietly sleeping. They were not there. A maid in the house next door had seen them come out of the gate. After that there was no news.

DURING the whole of this, the look in the eyes of the poor little Bumpuses and the plaintive whine in their voices showed me that I was held entirely responsible for this horrible occurrence. What a night followed! All the policemen of London were out in the wind and rain. All the telephones were ringing in agitated convulsions, and by three in the morning I was held to be very little less than a murderer. By that time I was myself so agitated, so wet in body and so exhausted in soul, that I had determined to give up the whole of our business, although now it was making such hopeful progress, and I was wishing that I had never thought so confidently to plunge into that most confused of all foreign countries, the psychology of one's fellow beings. Then as the clock struck four, and the tenth policeman was being offered a drink by the now tearful Mr. Bumpus, John quietly walked in, dragging with him a bedraggled,

hysterical, dripping, but triumphant Emmeline.

MRS. BUMPUS, with a shriek of joy, threw her arms round the neck of her dripping daughter. An odd thing then occurred. Emmeline pushed her mother away, saying peevishly: 'Don't fuss me, mother. Can't you see I'm tired?'

John was not, of course, in the least perturbed. He seemed to be scarcely wet, his little overcoat, with its upturned collar, giving him a strangely grown-up appearance, his eyes watching us all with the same critical, amused, slightly scornful glance that by now I knew so well.

'Where have you been? Where have you been? Where have you been?' cried Mr. Bumpus, exactly like an excited clock striking the hour.

'We've been on Primrose Hill,' said John quietly.

'Glad to see it's all right, sir,' said the constable, finishing his whisky and preparing to depart.

'All right, all right!' cried little Bumpus, obviously now in a state of hysterics quite beyond his control. 'It's not all right—it's terrible!'

The constable looked a little confused. 'Well, if you want me in the morning, sir—' he said, and departed.

'Don't be so silly, father,' said Emmeline. 'John and I have had a wonderful time. We would have been back before, only we lost the way. There was a lovely old woman——'

But her father could do nothing but turn upon John. 'You're responsible for this!' he cried. 'Leading my daughter . . . '

'Not now, not now, dear,' interrupted Mrs. Bumpus. 'We're all so tired. I'm sure that we shall discuss it better in the morning.'

Next morning, at ten o'clock, I was summoned to a family conference. When I arrived I found that I was, in the eyes of both Mr. and Mrs. Bumpus, the villain of the piece. It was still very uncertain as to what exactly Emmeline and John had done the night before. It appeared that John had tempted her with some story of meeting an old man on Primrose Hill who had bags of gold that he distributed for the asking. It seemed to me that it was very unlikely that Emmeline, a matter-of-fact child if ever there was one, would believe such a story as this, but more than anyone I've ever known, she was one who loved, beyond all else, the consciousness that she was getting something for nothing. John had had for a long time past a certain power over her, and I imagine that she was flattered by his so definitely pleading for her company. However, she went. That interesting fact now about her was the fashion in which she returned. Already, so few hours after her adventure, it was plain she was entirely changed, or, rather, not changed, because no human being ever changes—simply this accident had brought to the surface qualities that no one had seen before. She was independent, scornful, and imaginative. She talked about a little man in a green cap, about three stars that had hit a tree, about the rain dancing in circles around a heap of stones, and about an old woman with a basket of apples who had offered her a silver bodkin.

'Bodkin?' cried her father, now terribly afraid his favorite daughter was completely out of her mind. 'There isn't such a thing.'

'That's what John said it was, father,' said Emmeline. 'He said he'd had one once just like it.'

'Well, where is it?' asked her father.

'The rain blew the old woman away,' said Emmeline. 'If I go out there another night, John says she's sure to give me one.'

After this, can it be doubted that the little Bumpus was in a frenzy of despair? He took me into his stuffy little study and there told me quite plainly what he thought of me.

'You come into this house,' he cried, 'with some cock-and-bull story about helping us in our trouble. You deliberately encourage the boy in all his worst vices, you help him to abduct my daughter and to turn her head crazy with mad fancies, and now I suppose you expect us to pay you fifty pounds and say "Good-bye, and thank you very much." '

NOT at all, Mr. Bumpus,' I answered. I will admit that I was feeling frightfully tired and dishevelled after my stormy night's experiences. 'If you want me to tell you what I think, it is that John has woken your daughter up to some semblance of real life, and if he is given time, he will wake the rest of your children. Give me another twenty-four hours, and I may yet succeed in my task.'

Poor little Bumpus could do nothing else. He was in despair. John might be removed, but how would that help matters? His influence over the family would be as strong as ever. Poor little Percival would be the next to be corrupted. Wake up all their imaginations, and Heaven knew what might happen. Why, even Mrs. Bumpus . . . And at this thought he burst suddenly into tears and sobbed like a child.

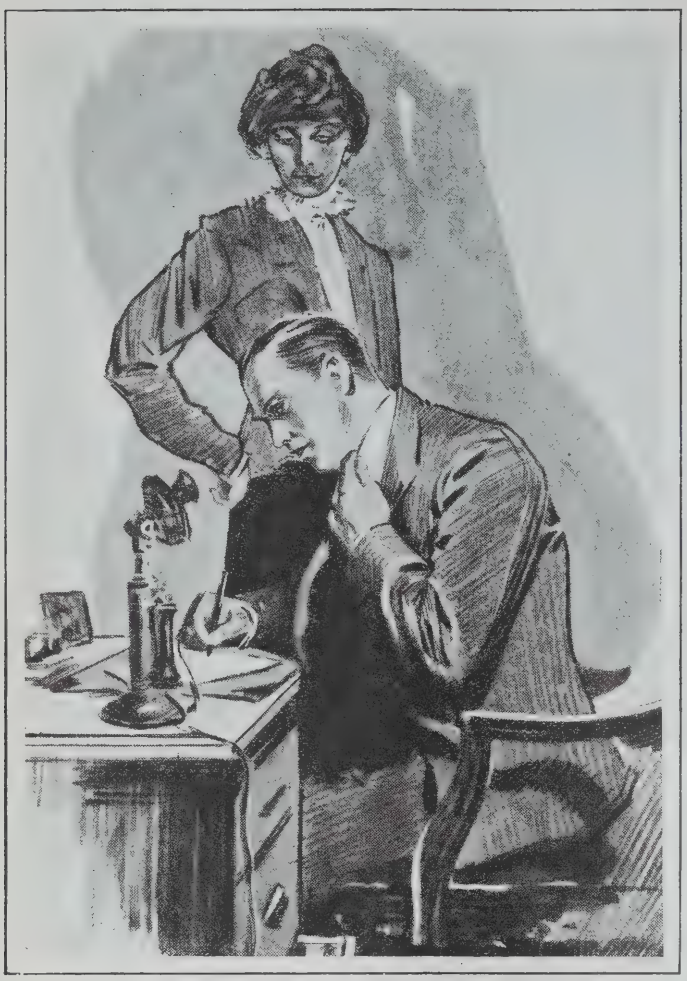
'I don't know what's happening!' he cried. 'The world used to be such a straightforward place.' You knew where you were, and things were either right or they weren't. The people, too. Now everything was upside down, and nobody was shocked any longer. If he lost his children, he didn't know what he'd do, and if they weren't going to respect him, then he had lost them, and so and so on. He ended by turning upon me.

'I dare say to you, Mr. Johnson,' he said, 'this all seems very funny. You're one of this new generation who don't believe in God, and think the only thing to do is just what you want to do; but you're corrupting the young, and I tell you the next generation will have to pay for the sins of this one.'

'Excuse me, Mr. Bumpus,' I answered, with all the dignity I could, 'you didn't engage me to come here and talk morals and modern sociology. I dare say you're perfectly right in what you say. My business is to remove John's attention from your family, and if I don't succeed within the next twenty-four hours, I will admit myself beaten, and make no further demands upon either your time or your purse.'

I left him with all the dignity I could command, but it was all very well—I had not at that moment the slightest idea of how I was going to win my case. I felt a beaten man, and I tell you that I was pretty miserable and conscience-stricken over the whole affair. When I had gone a little way down the street, I heard someone running after me, and was caught up by John. He informed me that they were all so foolish that

John came over to the old woman. He looked at her with that funny sarcastic glance of his, but there was something acclaiming that at last he had found someone worthy of his companionship.



One af the most tiresome of Chippet's relations was the old Dowager Countess of Pruxe, uglier than any human being had any right to be, who came of a morning into our office and asked questions.

morning, and that it was too late to go to school, and that therefore he would accompany me to my office for an hour or two. I tried to get from him the explanation of last night's adventure.

'Well, you see,' he said, 'I've been wondering for a long time whether I couldn't do something with Emmeline, and suddenly it occurred to me that if I took her out in all the rain and lost her, it would be funny to see what she'd be like afterward.'

'That was very wrong, John,' I said.

'Why?' he asked.

'It's always very wrong,' I went on, 'to make people unhappy just for your own pleasure.'

'Why?' he asked.

'Well, of course it is,' I continued. 'What we're here for is to make people happy, not unhappy.'

'Who said so?' he asked.

'You want people to make you happy, don't you?' I asked.

'I don't care what they do,' he answered. 'I can be happy or unhappy all by myself.'

'But don't you mind what other people do or say?' I asked him.

'Why should I?' he asked.

'Other people can make you feel all sorts of things.'

'Why?' he asked.

'Well, because they're so close to you, and we're all mixed up together.'

'I'm not mixed up with anybody,' he answered. 'I just wanted to see what Emmeline would do, and what Uncle Henry would do, and what the policeman would do, and what you'd do. I haven't finished,' he ended, with a chuckle, 'seeing what Uncle Henry will do. I'm sure he'll do something silly. Emmeline's not so bad,' he added reflectively. 'If you tell her stories, she believes them.'

I will frankly admit that I was in despair when we entered the office. I was beginning, ever so slightly, to understand, in my own experience, why the Bumpuses were so anxious to be rid of John. I was beginning to wonder how long it would be before I myself would long to escape from that curious, inquisitive, sarcastic glance.

We entered the office and therein found Chippet, very bored indeed, and his distant cousin, Lady Pruxe.

'Good morning, Mr. Johnson,' she said, and as soon as she spoke I realized where it was that I had already heard that odd, husky voice. Other realizations were achieved at that same moment.

John gave a little gasp, and stood in the middle of the floor, staring. The old woman looked down from her chair and stared in return.

'Who's that strange boy?' she asked.

'A little friend of mine,' I answered, 'come in to pay us a visit.'

From that moment, you may believe it or no, as you please, the two never removed their eyes from each other's face.

'Come here, boy,' the old woman commanded.

John came over to her.

'What's your name?' she asked.

'John Borstal Clay,' he answered.

'Where have I seen you before?' she asked.

He shook his head.

'What do you wear all that jewelry for in the daytime?' he asked.

'Because I like to,' she answered.

'Why?' asked John

'Because they're pretty,' she answered. He looked at her with that funny sarcastic glance of his, but this time there was something in his smile that I had never seen before, something of recognition, of acclaiming that at last he had found someone worthy of his companionship.

'Feel as though I'd seen you somewhere before,' she said slowly. But he was looking at the rings on her fingers.

'I know that green one,' he said, pointing, 'only I don't know where . . . ' He shook his head. 'Somewhere, a long time ago.'

She looked at him queerly. 'That was given me by my husband,' she said slowly, 'sixty-three years ago, and it was in [illegible] family—' She broke off.

'You're a queer little boy,' she said.

'Will you come back to my house a[nd] have lunch with me?'

'Yes,' he answered. 'Have you got p[ea]cocks in your house?'

'No.'

'Why not?'

'We have peacocks in the country, [but] in London.'

'Why?'

'Oh, because they like to move abo[ut] and they make such a noise.'

'I like you,' he said, nodding his he[ad] confidently. 'You're more clever than [the] others.' Then he turned and saw the p[eac]ock companion. I watched creep into his e[ye] just the expression, the malicious, inqui[si]tive, humorous, sporting expression that had once seen as he watched Emmeli[ne] Gertrude, and little Percival, and I kn[ew] that he had found a new occupation . .

John Borstal Clay has taken up [his] permanent residence in the enormo[us] gloomy house in Portland Place owned [by] the Dowager Countess of Pruxe. The [old] lady has already had four different co[m]panions during the three months of his st[ay] there. She herself declares that she has new joy in life. Many weeks ago M[r.] Bumpus paid the firm of Boniface and Co[m]pany a check for one hundred pounds a[nd] wrote a little note expressing in the warm[est] terms his appreciation of our efforts on [his] behalf.

The Moon—A Dese[rt]

(*Continued from page 2*)

many years; in fact, up to two centuries [ago] some places in Europe. From these exte[n]sive observational data, taken in connecti[on] with the known phases of the moon, it h[as] been impossible to find any certain corre[la]tion between them.

There have been many fantastic pr[o]jects developed by ill-balanced minds [re]going to the moon or communicating wi[th] the moon. If one could fire a project[ile] with a speed of seven miles a second, [it] would, except for the resistance of t[he] air, recede from the earth to a distance [as] great as that of the moon in a few da[ys]. But who could aim a projectile in such [a] direction that, moving under the co[m]plicated forces of the earth, moon, and su[n] it would strike the moon? No gunner h[as] ever faced so serious a problem, even wh[en] shooting many miles at an invisible targ[et] by theory alone. It is doubtful that, ev[en] if the earth had no atmosphere, the mo[on] could be hit once in a thousand shots.

Even more fantastic, impractical, a[nd] silly are the propositions to go to the mo[on] by any sort of airship or by a shell propell[ed] by a long series of explosions.

BUT if one should by some unimagin[able] means arrive on the moon, what would [he] find? To begin with, he would be in a wo[rld] on which he would weigh only one-six[th] as much as he had weighed on the surfa[ce] of the earth. There would be no atmosphe[re] around him to breathe. The sky abo[ve] would be black in the daytime becau[se] there would be no atmosphere to scatter t[he] light of the sun and give it the blue colori[ng] observed from the earth. The stars wou[ld]

shine with a steady brilliance, because there would be no atmosphere to make them twinkle, and they would be visible in the daytime as well as at night.

The sun would beat down with its rays never cut off by a passing cloud nor dimmed by an atmosphere, and the terrestrial visitor would soon find its motion across the lunar sky painfully slow. From morning to noon would be more than a week of our time, and from sunrise to sunset would be nearly fifteen days. During that long period the moon's surface would become very hot, probably above the boiling point.

Eventually the sun would set, and the night of about fifteen of our days would follow. Since there would be no atmosphere to retain the heat of the moon's surface, it would be rapidly radiated away into space. Within a few hours after sunset the temperature would fall probably to zero, and before one of our days had elapsed it might descend to 100 degrees below zero.

We can imagine a terrestrial visitor in this intolerable frigidity, trying to breathe a vacuum, resting on a rock barren of soil, and anxiously waiting for the sun to appear over the eastern horizon. Within a few hours its torrid rays would burn him so that he probably would look forward with equal anxiety to the cool of evening.

The moon differs from the sun in that there is no fire upon its surface; and from the earth in that it has no water or atmosphere. It is a dead world. We know, from several lines in evidence, that the moon has no atmosphere. One is that during an eclipse of the sun, the moon's margin is perfectly clear and sharp, with no apparent distortion due to refraction. Similarly, when a star is hidden by the moon, it disappears suddenly instead of gradually, as would be the case were there an atmosphere; and again there is no evidence of the effects of refraction.

Furthermore, if there were an atmosphere on the moon, the surface would show signs of erosion, whereas it is actually a rough and jagged waste, much cracked as a result of the great extremes of heat and cold to which it is subject. Nor is there any soil, with the exception perhaps of volcanic ashes. We know that there is no water on the moon, for if there were, much of it would evaporate during the long lunar day and form an atmosphere.

Why has the moon no atmosphere? No doubt in the past large quantities of vapor have been emitted from its interior, but it has disappeared. The gas may have united chemically with the other elements on the moon, or the swiftly darting particles of which it is composed may have escaped into space because the gravity on the moon is insufficient to hold them down.

Owing to the peculiarity of the rotation of the moon on its axis and around the earth, the same side is always facing us. Therefore, only one side of the moon has ever been exposed to our examination.

THE height of a lunar mountain is quite simply determined. It is found from the length of the shadow thrown by the mountain peak when the sun's rays strike it obliquely.

Besides the mountain ranges, there are numerous isolated peaks and more than 30,000 craters that have been mapped. These latter are the most striking phenomena of the moon's surface. They seem to have been formed at successive stages, for they sometimes overlap, new ones having encroached upon the old. It is notable that the newer craters have deeper floors and steeper and higher rims than do the older ones of the same diameter; very often lofty and spire-like peaks arise from their centers. These lunar craters are frequently of great size, ranging from fifty to one hundred miles in diameter.

How were such craters formed? Astronomers are not yet agreed upon the solution of this problem. There are difficulties in the way of the acceptance of any of the theories that have been proposed. Some hold that they are of volcanic origin; yet there is no evidence of lava flows. Others believe that the craters were formed by the bursting out of huge masses of gas which accumulated under the surface, became heated, and were subject to great tension because of the moon's contraction. If so, what caused the appearance of mountain peaks in the center of many craters?

Another theory is that these mysterious craters were formed by the impact of immense meteorites from the outside. There being no atmospheric cushion, such meteorites would hit the surface of the moon with a speed of 50 to 100 times that of a cannon ball. This theory would account for the mountain peaks within the craters as a reaction from the original splash or from the heat produced by the collision. Owing to the absence of erosion on the moon, the great scars left by such terrific impacts would never be worn away.

ASSOCIATED with these features of the lunar geography are the so-called seas, large and comparatively level areas, which were first observed and given that name by Galileo. The term *mare* (Latin for 'sea') is still retained by astronomers, though the more accurate modern observation shows that they contain no water. These comparatively smooth areas of the moon's surface are the parts which appear dark when seen with the naked eye or through a small telescope.

Other markings on the moon consist of the lines which we call rays and rills. The rays are found radiating from the great craters, and often extend for long distances. Their origin is obscure. The rills are apparently immense cracks in the surface, due either to volcanic action or to the rapid cooling and shrinking of the moon. Some of the rills are as much as 150 miles in length, and more than 1,000 have been mapped.

Conditions on the moon being such as we have described, it is hardly necessary to say that life, in the ordinary sense of the word, would be impossible there.

Alternately baked and frozen, the moon, a dead, atmosphereless and waterless desert, winds its way about the earth in obedience to the earth's gravitation. It shows us what our world would be like if it were so small that it could not hold with its gravitative force an atmosphere and a water covering upon its surface. And yet the majestic motions of the moon, which have been determined by astronomers and mathematicians with a precision not exceeded, and rarely equaled, in other domains of human endeavor, are among the most convincing evidences of the orderliness of the universe in which we live, and of our ability to grasp it and to adjust ourselves to it.

How to Become A Master of English

is a valuable FREE booklet which *proves* that the Kleiser Mail Course in Practical English and Mental Efficiency will teach you to *Write Stories that Sell—Literature that will Compel Attention;* it will show you how to *Enlarge Your Stock of Words—Use the Right Word in the Right Place—Prepare Sermons, Addresses, Advertisements, Letters, etc.*

BOOTH TARKINGTON

The FUTURE of the TANK

By GEORGE H. RAREY

PART II

NO ATTEMPT is made herein to prove that even the modern tank will be able to win a war, or even a major engagement, unaided, for it will not. Tanks are able to assist in taking ground from the enemy, but they cannot hold it. This is due to the fact that they are an excellent target when standing, and to their vulnerability. While they will shed rifle and machine-gun bullets as easily as a duck's back sheds water, they are extremely vulnerable to the 50-caliber armor-piercing bullet, and all larger calibers, when a direct hit is obtained.

It is not so easy to hit a tank, however, when it is moving and the Tank Corps depends for protection upon the speed of their vehicle as much as upon its armor. In the modern tank, as designed by some nations, more dependence is placed on speed than on armor.

Efficiency and economy in the handling of men and dollars require that armored vehicles be provided to crush wire obstacles and machine-gun nests, neutralize pill-boxes and other strong points, thus protecting the infantry troops from the great and inevitable losses incident to attacks against such defenses, and facilitating infantry advances.

It is practically certain that tanks will in the future be used to accomplish certain missions heretofore accomplished by cavalry.

A British writer says: 'For over 1,500 years cavalry has helped to make the history of the world. The age of cavalry was ushered in on August 9, A. D. 378, when the infantry legions of the Roman Empire met a new challenge on the plains of Adrianople. The cavalry of the Goths swept down on the flank of the Roman infantry, and so tremendous was the impact that the Legions were pushed together in helpless confusion. Into this quivering mass the Goths rode, plying sword and lance against the helpless enemy. Thus the undisputed reign of the Roman infantry as the "Queen of Battles" was at an end, and a new branch of the service, a new arm, the cavalry, was to share the pages of history from then on.'

Due to the recent development of the machine gun, however, the infantry can now strike back with great effect from positions of security, and, in position warfare, the use of these weapons with the barbed-wire obstacle not only enables infantry troops to impede the advance of, or hold up, the cavalry, but they can make its use an extremely costly proposition.

Mechanical cavalry, or tanks, are the answer to the barbed-wire obstacle. They are impervious to the stings of the rifle and machine-gun bullet, most shell fragments and splinters, grenades, and similar weapons, while neither a man on foot, a horseman, nor a horse can be protected by armor. The foot soldier now carries close to his limit of weight and neither the soldier nor the horse could carry for any distance sufficient armor to protect him from armor-piercing bullets.

Fifty or a hundred years from now the carrying capacity of the foot soldier will be much the same as it is today, and a horse will still be just a horse, but no one can foresee the extent of the development of the tank and other mechanical warfare vehicles in that length of time.

Original Thiepval Mark I Tank with anti-bomb roof and 'tail.'

The tank and the armored car will, no doubt, be used to accomplish in future wars many missions, which have in the past been accomplished by the cavalry. The armored car of the future will probably be able to operate either on or off the roads, as the tanks do now, and by having this increased mobility these cars will be of greater value as a harassing force than they were in the World War.

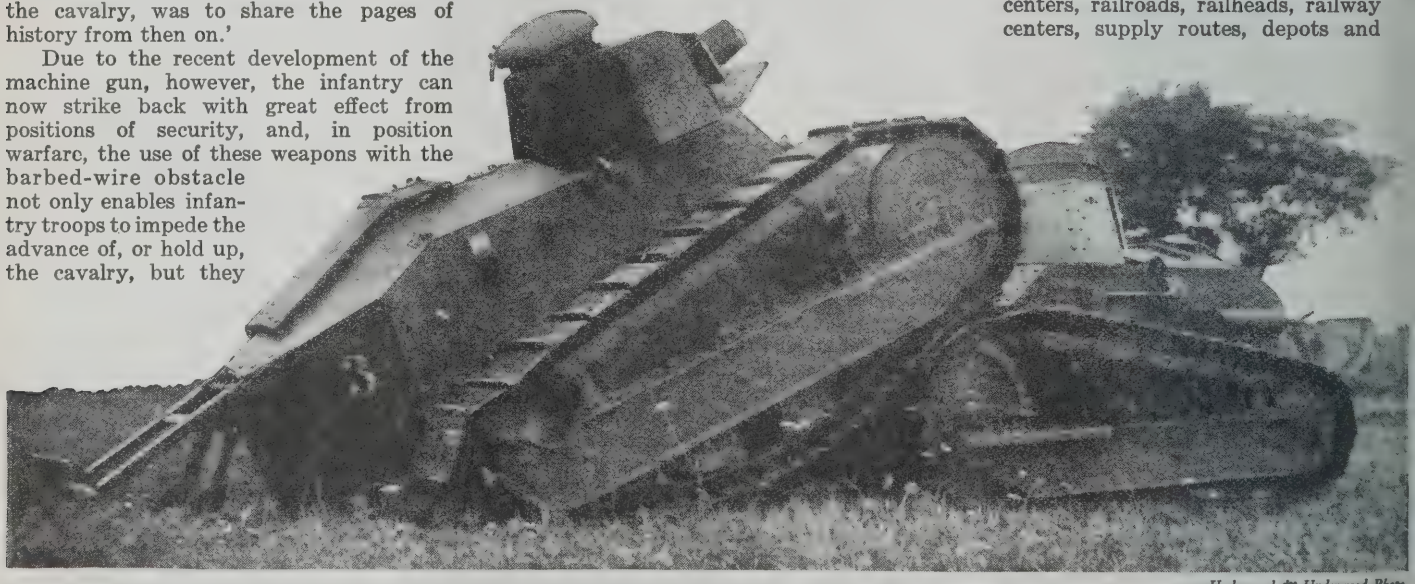
Not being confined to the roads, the armored car units will not be stopped by mined roads or roads torn up by shell fire, and it will be unnecessary to assign tanks to these units to tow the cars over such obstacles as it was found necessary to do in the World War.

The missions upon which armored cars may be employed in the future may be summarized as follows:

Equipped with radio, these cars will be enabled to function as advanced cavalry, and they will, as stated, also be valuable as a harassing force against a retreating enemy; or, in reconnoitering, in open warfare, the routes, bridges, and so forth, to be used in a massed tank attack against enemy supply routes and other important points back of his main positions.

Whether the next war is to be one of position or of movement, the delivery of combined surprise attacks by tanks, armored cars and airplanes, against what has come to be known as enemy 'nerve centers,' in rear of his main positions, may be expected.

Command and communication centers, railroads, railheads, railway centers, supply routes, depots and



Two tanks in close combat, photographed during maneuvers at Fort Wadsworth, Staten Island. —*Underwood & Underwood Photo.*

training centers, unless located a considerable distance back of the front lines of the positions, will no longer enjoy a certain immunity from attack on account of the screen heretofore provided by these front positions.

Had the war not terminated in 1918, this plan would, no doubt, have been adopted as one of the basic tactical ideas for 1919, but even though it was never put into execution, it points the way toward new missions for the tank.

The feasibility of using the modern fast tank in proper numbers for an enveloping operation, either in position or open warfare, is apparent. In position warfare, a break through on a quiet front on the enemy's flank by a body of tanks would divide the enemy's attention, to the serious detriment of their defensive efforts, while a further enveloping movement, with masses of tanks attacking from the rear, would be fatal.

Such attacks in open warfare could easily be made and their value is obvious.

It will always be necessary to use tanks in large numbers. If the World War experience proved anything at all concerning them, it was the utter futility of using them in driblets. They were used in small numbers many times on the Western front because they were not available in sufficient numbers, and seldom were they really effective when so used. They were not available in larger numbers because their value was not fully understood during the earlier engagements, and also because, when Britain started to build them, practically the entire British manufacturing facilities were employed in the manufacture of the many other things needed for war.

Tank in action, smashing down wire obstacles. —*British Official Photo.*

It was a case of using them in action as fast as they could be secured, with the result that tanks were frittered away in small actions having no decisive results, or in larger actions where, due to the shortage, those available were either strung out over a wide front, or were given so many missions that they were put out of commission owing to mechanical trouble or were knocked out by enemy artillery.

When the results of the various tank actions were reported in England, the authorities were for or against tank manufacturing projects, just as the reports were favorable or unfavorable. This in turn resulted in the continued use of tanks in small numbers. The British infantry bore the brunt of this vacillating policy and suffered terrific casualties, a large percentage of which might have been avoided had the sustained support of the British War Office been given to tank production from its inception.

The ability of tanks while in motion to make very rapid changes in direction makes it difficult for artillery to hit them until they are fairly close, and from that time until tanks can reach the gun position is a matter of a few moments, so a massed tank attack would be a difficult force to stop. Some of the tanks would, of course, be knocked out, but with line after line of these moving fortresses coming forward at the fastest speed permitted by the terrain, and the forward waves of tanks firing on the opposing artillery, *this kind* of an advance would be a different proposition from advances in the past.

Tank towing prize taken during the offensive on the Cambrai front. —*British Official Photo.*

The latest fighting tanks will probably be of two classes: the light tank of approximately six tons, and the heavy tank of anywhere from eleven to twenty-five tons. From present indications, the high speed of these tanks will range from ten to thirty miles an hour. The light tank will be held to about the weight indicated or slightly less, that it may be transported for long moves in trucks or on trailers. The weight of the light tank cannot be reduced under six tons without decreasing its efficiency as a wire-obstacle destroyer.

Tank construction presents some of the same difficulties encountered by aircraft builders. Any increase in weight, whether for thicker armor, more guns, ammunition, crew or fuel, requires a larger power plant or decreases the speed of the vehicle. The weight of the tank, fully equipped, cannot be too great or its mobility will be seriously affected due to the carrying capacity of bridges. It must not be too large or its bulk will make it a better target for enemy gunners. So it is a case of determining just which characteristics are the most desirable and building those qualities into the tank, sacrificing the other desirable qualities to a certain extent. The general aim will be to provide as much concentrated fighting power as possible, giving it as much armor protection as is consistent with the speed desired.

Better armor will undoubtedly be available for the modern tank than was to be had during the last war, but it is hardly likely that it will be much, if any, heavier or thicker than that used in the past, which was a fraction over one-half inch on the best tanks. Germany finally built a few tanks which carried armor of more than one inch in thickness. These tanks were bulky, had a very low degree of mobility and were not effective fighting units.

Since it has been found that it is impossible to armor a tank against all types of artillery shells, the tendency has been to discontinue attempts in this direction and provide more speed as a means of protection.

During the early days of tank experimentation in England, a proposal was put forward to build a huge tank, which Colonel Fuller, of the Royal Tank Corps, describes as a veritable Juggernaut, heavily armored, highly offensive and capable of moving across country. It consisted of a platform mounted upon three wheels, two driving wheels in front and the steering wheel behind. It was to be equipped with three turrets, each containing two four-inch guns, and its motive power was to be derived from an 800-horsepower set of Sunbeam Diesel engines. The specifications as worked out were as follows:

Armament	3 twin 4′ turrets with 1800 shells
Horsepower	800 H. P., with fuel for 24 hours
Total weight	300 tons (estimated)
Armor	3 inch
Diameter of wheels	40 feet
Tread of front wheels	13 feet 4 inches
Tread of steering wheels	5 feet
Length	100 feet
Width	80 feet
Height	46 feet
Clearance under body	17 feet
High speed	8 miles per hour

The authorities considered this proposition, but came to the conclusion that when completed and fully equipped it would weigh nearer 1,000 tons than 300, and abandoned the scheme as impracticable, believing it better to have a large number of

smaller tanks than a few large ones. Their judgment has been shown to be sound, and it is hardly likely that the large land battleship will ever be used. Its low speed, its great bulk and weight, the development of high-powered artillery and armor-piercing shells are all factors which make its use impracticable.

Machine guns carried by tanks fire the ordinary ball, tracer and armor-piercing bullets of approximately .30 caliber. It is highly probable that machine guns capable of firing the .50 caliber bullets, of the three types mentioned, will be mounted in the larger type of tank.

The other weapons used consist of the one-pounder and six-pounder, or similar weapons, depending upon which nation is building the tank. These guns use the common steel, armor-piercing, high-explosive, canister, and smoke shells.

WHEN going into action, the future tanks will be accompanied or closely followed by a radio signal tank carrying an official observer, probably a staff representative, who will be enabled to inform the higher command as to the progress of the action along his front. The presence of this observer will aid in the prompt and efficient handling of reserves.

Tanks will also be accompanied or closely followed by their own artillery or by protected, motorized artillery assigned to the tanks to protect them from enemy anti-tank guns which hold their fire and thus conceal their position until the last moment. This method of tank aid was used during the last war and found to be very valuable, although the protected and motorized artillery was not then available.

They will also be served by aircraft, which will aid in locating, reporting the location of, and help to dispose of anti-tank defenses of the enemy.

Another weapon which could be mounted upon some form of protected tractor—and profitably used—is the mortar. The tractor appears to be the logical means of transportation for the Stokes, and other mortars, permitting their use at a given locality upon short notice, besides providing a means of rapid withdrawal after they have accomplished their mission.

A tank equipped to carry and project gas shells is a probability. Gas projectors were transported upon gun carriers during the last war. They were reported to have been of valuable aid, for they could be used upon short notice and in localities where wheeled vehicles could not have been taken.

A TANK equipped to lay a smoke screen is a possibility, with the chances slightly against its adoption on account of the small practical value of this unit in action.

Fatigue of troops may stop an advance gradually, but lack of supplies will stop it absolutely, and one of the greatest advantages to accrue to the fighting forces—as the result of the adoption of mechanical war vehicles—and second in importance only to the fighting tank, is the development of the tank supply ship. These vehicles were found to be very necessary during the World War, and, indeed, they have always been necessary. Ever since men began to fight in groups, one of the main difficulties has been to get supplies forward to them.

Of late years the supply question has assumed greater proportions than ever, it has come, in fact, to be about one-half of the battle. Every weapon invented, and every new type of material found to be necessary to the prosecution of war, adds to the burden of the supply organizations and facilities.

The supply tank was found to be of such importance that the British remodeled some of their old fighting tanks into supply tanks. It was a case of doing this, or of using men to carry supplies from the forward dumps to the localities where they were needed, and when one supply tank released from 300 to 400 men from this work, its value was apparent.

Thousands of casualties occurred among the carrying parties as they trudged along the road or trail, or wound in and out of a barrage, carrying food, ammunition and other supplies forward to the new position gained. This was work for a supply tank, which could do it far easier, quicker and with less than the carrying parties, besides releasing these men from this coolie labor and keeping them on the line.

The British also converted many of their gun-carrying tanks into supply tanks and they gave excellent service in this capacity. Another method used to take supplies forward was a chain of sledges, towed by tanks. At the Battle of Hamel, on July 4, 1918, four of the gun carriers took forward supplies which would have required 1,200 men to handle, and when they were not busy providing for their own organizations, they brought up ammunition for the infantry weapons, as well as engineer stores and material, water, and so forth.

IN HIS report upon the organization of the First Army, General Pershing said: 'The *wide front held* by our army, *the scarcity and character of the roads*, and the *constantly changing progress of the battle*, created unusual demands on field transportation. We had only twenty-eight per cent of the authorized allowance of motor transportation—French aid raised this to fifty-two per cent—and *animals*, at all times hard to obtain, *were quickly used up in service.* With each successful penetration of the enemy's lines, the increased length of haul and the resulting casualties caused a further shortage of animals. Due to lack of transportation, the 81st, 88th and 7th Divisions could not be used in the advanced portion of the battle front.'

The writer is responsible for the italics in the above extract of General Pershing's report. It will be noted that the scarcity and character of the roads are shown to be factors which created unusual demands on field transportation. It will also be noted that the commander-in-chief was deprived of the full use of at least three divisions due to lack of transportation. The availability or non-availability of three war-strength divisions for use in the advanced portion of the battle front may well mean the difference between success and failure, and this report shows the paramount importance of providing all divisions with sufficient transportation of a type which is not confined to the roads.

The army which has the superior force of tanks, motorized artillery, motorized gas units, and aircraft, as aids to the infantry, will win, for these weapons will tip the scales of the military balance of power in favor of the nation which has thus intelligently prepared its army for war, *in time of peace*

New Idols for Galler

(*Continued from page 7*)

of New York Americans; Babe Dye, Di Irwin and Gordon Fraser of Chicag Charlie Langlois, Tex White and He Drury of Pittsburgh; Johnny Sheppar Happy Holmes and Frank Foyston Detroit—all names that are new in t American sports directory but names th have been breaking into the newspap headlines frequently. You will hear mo and more of them.

Hockey is a Canadian game. It w developed in the Dominion. Years ag when getting a foothold, hockey knew splendor such as it has now. Hockey w then played on outdoor rinks, by daylig or gaslight. A few of the rinks were cover but none was heated. In the northern zon of Canada spectators underwent har ships. If the weather was warm the i was generally so bad that play had to postponed or canceled. If the gas was lo the game was played in semidarkness.

There were seven men on a side, go keeper, point, cover-point, left wing, rig wing, rover and center. When the tean lined up, the point and cover-point sto in a line ahead of the goal keeper, the rov was between the two wings and the cent stood ahead of him.

Rarely more than one man went dow the ice with the puck. If he succeeded passing the wings and rover, it was up the cover-point to check him and if th cover-point failed then the point took u the duties.

Being almost entirely an individual gam as played then, the competition develope feuds and counter-feuds. There were figh between the players and between th spectators. Rivalry was keen and play wa rough. 'Get your man!' was the battle cr but it really meant, 'Cut down your man The 'getting' was not accomplished b checking but by stick wielding. They cu each other down from in front and fro behind. Sticks were laid over head an body. Players were frequently knocked col

There was no passing. The player wh got possession of the puck carried it. Th forward (wrist) shot was much in use bu the real accomplishment was the executio of a backhand lift. The puck carrier woul lift the puck high into the air. It frequentl became lost in the upper darkness an players would wait breathlessly for it descent. The object was to lift the puc into the net. Sometimes it landed there more often it missed.

Ten years ago ranking hockey player were risking their lives for $150 a mont and playing a three-month season. A playe who got as high as $500 a season considere himself well paid. Today, some of th leading players draw $5,000 a season an several get more than that. With mammot arenas and increased admission prices salaries will keep mounting and the con tract of a desirable player will bring $25,00 or more on the market. There are a fe players today who cannot be bought so low

Hockey was constructed by the Cana dians. They built slowly but they buil carefully, soundly, thoroughly. They hav provided a game that is even better suite to the American taste than to the land o its nativity. It is the fastest and one of th most popular of sport spectacles.

How a President Was Impeached

(*Continued from page 5*)

journeyed to Chicago by way of Philadelphia, New York, Albany, Buffalo and Cleveland. After the unveiling he returned by St. Louis, Indianapolis, Louisville, Cincinnati and Pittsburgh.

On the early part of the trip he received a courteous and even cordial reception, but when he reached Ohio trouble began. Deliberate insult was evidently part of a systematic plan, and to this were added malicious and utterly false reports of his speeches, which were so garbled as to give the impression to their readers that he was drunk, an impression confirmed by the direct charge which ran like wildfire over the country. It was completely false and was later proved so, but it has ever since, combined with the misfortune of his inauguration, served as the basis for the widespread belief that he was an habitual drunkard.

Andrew Johnson came to the presidency superbly equipped but also with a number of heavy handicaps.

As A result of the press reports, although he held his audiences well and made a deep and favorable impression upon them, the effect on the country as a whole was bad and aided the radicals materially.

The elections gave the radicals a two-thirds majority in both Houses of Congress, and in addition complete confidence in their power. When Congress met, every southern state, except Tennessee, which had ratified in the spring, had rejected the 14th Amendment or was in the process of doing so. On this alleged contumacy of the 'rebel states,' the radicals placed the responsibility for the harsh policy of reconstruction which was now adopted and carried out over the President's veto. Conscious of their strength, they determined, if he interfered in any way with their plans, to impeach him and after conviction to remove him from office. As a warning of what impended, the vague threats employed for a year were abandoned for violent abuse and an open expression of their intention.

Johnson was aware of the likelihood of his impeachment and that he could by yielding stop the whole movement. But he would not consider the matter, and when Browning, one of his Cabinet, urged some action to check it, he replied, 'I will do nothing to check impeachment, if there is any wish to press it. I am tired of hearing allusions to impeachment. God Almighty knows I will not turn aside from my public duties to attend to those contemptible assaults which are got up to embarrass the Administration. Let the House go forward and busy themselves in the matter if they wish.'

Among those most active in the movement which now developed for impeachment were Representatives George S. Boutwell, of Massachusetts, and James M. Ashley, of Ohio. They decided that Johnson had been privy to the plot to assassinate Lincoln, and they made no secret of their alleged belief. When they could find no evidence to sustain this opinion they encouraged its manufacture for the occasion. And so when the President vetoed the bill granting negro suffrage in the District of Columbia, Ashley at once introduced a resolution of impeachment against him, charging him with usurpation of power and violation of law, with corrupt use of the appointing, pardoning, and veto powers, with corrupt disposition of public property, and corrupt interference in elections.

Thus began the first attempt at impeachment. The judiciary committee was unable to find any incriminating evidence against the President, but they reported that enough had been found to warrant the continuance of the investigation.

In the meantime the Senate, under the leadership of Wade, was trying to prepare for the trial by the admission of two new states, Nebraska and Colorado. Both bills passed and were vetoed by Johnson, and in the case of Colorado the veto was effective. But two Senators from Nebraska were added to the radical majority and Wade was elected president *pro tem* of the Senate and thus, under existing law, came next in succession to the presidency of the United States.

Johnson's tailor shop.

When the new Congress met, the impeachment was again taken up by a committee. They investigated Johnson's past life, they questioned many witnesses, they set spies upon him, and sought to entrap him, but all to no purpose. The following quotation from one of the later minority reports describes this process:

> A dragnet has been put out to catch every malicious whisper throughout the land, and all the vile vermin who had gossip or slander to detail, hearsay or otherwise, have been permitted to appear and place it upon record for the delectation of mankind. Spies have been sent all over the land to find something that might blacken the name and character of the Chief Magistrate of our country. Unwhipped knaves have given information of fabulous letters and documents . . . That most notorious character, General L. C. Baker, chief of the detective police, even had the effrontery to insult the American people by placing spies within the very walls of the Executive Mansion; the privacy of the President's home, his private life and habits and most secret thoughts have not been deemed sacred or exempt from invasion; the members of his household have been examined; and the chief prosecutor has not hesitated to dive into loathsome dungeons and consort with convicted felons, for the purpose of accomplishing his object of arraigning the President on a charge of infamous crimes.

And so, in July, by a vote of five to four, they reported unfavorably on the resolution. The radical leaders, however, got the question recommitted and by autumn, without new evidence, one member of the committee, Churchill of New York, was persuaded to change his mind, and a favorable report was submitted in December, 1867, accompanied by twelve hundred printed pages of testimony proving beyond shadow of doubt that Andrew Johnson was guilty of no crime. Incidentally, it proved also that he was no drunkard, or, for that matter, not even a tippler. Even Boutwell had to admit that the only charge the committee could bring was the vague one that Johnson had used the power of the nation for the purpose of reconstructing the Government in the interest of rebellion and of restoring the old Democratic Party to power.

Two minority reports were submitted, one of which thus summed up the movement:

> His greatest offense, we apprehend, will be found to be that he has not been able or willing to follow those who elected him to his office in their mad assaults upon and departure from the constitutional government of the fathers of the Republic; and that, standing where most of his party professed to stand when they elevated him to his present exalted position, he has dared to differ from a majority of Congress upon great and vital questions. He has believed in the continuing and binding obligations of the Constitution of the Union and the States comprising it, and that when the rebellion was put down the States were all and equally entitled to representation in the Congress of the United States.

On December 7, by a vote of 108 to 57, the resolution was lost. The first movement for impeachment had failed, not because of the flimsiness of the charges and the testimony, nor because there was left in the majority any sense of justice and right, but because it was clear that a trial would result in acquittal.

The second attempt at impeachment, which failed also, was closely connected with the third and successful attempt. In the closing days of the last session of the 39th Congress was passed, over the President's veto, the Tenure of Office Act, which limited severely his power of removal by making the consent of the Senate necessary. A proviso excepted from its general provisions the members of the Cabinet who were to hold for the term of the President by whom they were appointed and for one month afterward.

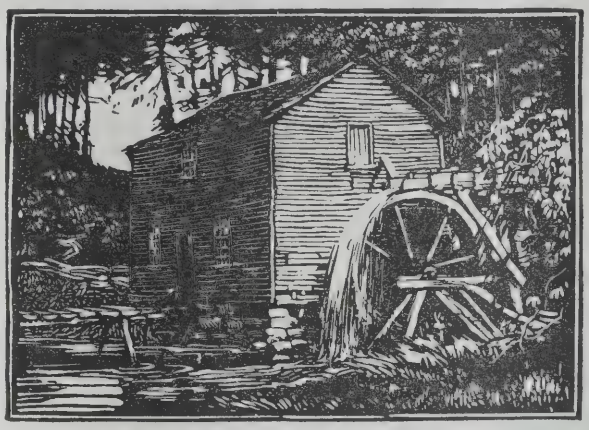
Secretary Stanton declared the act unconstitutional and assisted the President in the preparation of the veto message. Stanton, it may be added, had been appointed by Lincoln during his first term and had not been reappointed by either Lincoln or Johnson. Attention was called to the fact, during the debates on the bill in Congress, that the existing Cabinet was not affected by the law, and no one questioned the correctness of the interpretation.

Of Lincoln's Cabinet, Seward, Welles and McCulloch were devotedly attached to Johnson and thoroughly in accord with his policy. Stanton disagreed with the President from time to time, but gave no open indication of disaffection during the first two years of Johnson's Administration. All the time, however, he was utterly disloyal to the President and was the spy of the radicals in the Cabinet. After the passage of the Tenure of Office Act, he became increasingly defiant and offensive in manner and finally put an end to harmony in the Cabinet. The President, patient as he was, finally determined to get rid of him, and hints that his resignation would be acceptable having been ignored, on August 5, 1867, he sent Stanton a curt request for his resignation, which was as curtly refused. Thereafter Stanton attended no Cabinet meeting.

On January 7, 1867, the House adopted a resolution, proposed by James M. Ashley, of Ohio, authorizing the Judiciary Committee to inquire into the official conduct of Andrew Johnson. Although the Committee six months later by five to four decided there was no ground for impeachment proceedings, the majority finally yielded and the case was reopened and the taking of testimony continued. This is the way matters stood when Johnson removed Stanton.

The President was not only desirous of getting rid of Stanton. He believed the Tenure of Office Act unconstitutional and was very anxious to secure judicial interpretation of it. He therefore persuaded General Grant, though with some difficulty, to accept an *ad interim* appointment with the understanding that he should refuse to yield the office to Stanton after the Senate had refused to agree to the latter's suspension and thus force him to appeal to the courts, in which way a decision as to the constitutionality of the law would be secured. It was agreed that if General Grant should change his mind, he would notify the President in time for him to make another appointment. And so, on August 12, Johnson suspended Stanton and appointed Grant Secretary of War *ad interim*.

On January 13, 1868, the Senate refused to concur in the suspension of Stanton, and Grant, instead of holding on, surrendered the office before it was demanded. He reported the matter to the President, who was both outraged and disappointed but who restrained his temper admirably. A correspondence, increasing in acrimony, followed, which was very damaging to General Grant. The House of Representatives, aware of what was going on, demanded copies of the correspondence, which were at once furnished. The leaders of the impeachment movement were full of unholy glee when the first part reached them. At last a crime had been discovered. The President had apparently violated both the Tenure of Office Act and the Conspiracy Act of 1861. But the final letter of the President, backed by letters of five members of the Cabinet, showed that if the laws had been violated, Grant as well as the President was guilty. And since Grant was slated for the Republican nomination for President and was the idol of the country, it would never do to implicate him.



Pen-and-ink impression by GERALD VAN DER HEYDEN

Thus ended the second attempt at impeachment.

The third and successful attempt was soon to follow. Johnson was more than ever determined to rid himself of Stanton. He did not desire impeachment, but he would not turn out of his path to escape it.

The first thing to do was to find a new Secretary of War. Failing with General Sherman, who deeply sympathized with him but refused to be entangled in politics, he attempted to secure General George H. Thomas, who was equally averse to the quarrel. Finally he turned to Lorenzo Thomas, Adjutant General of the Army, who accepted. Whereupon the President removed Stanton and appointed Thomas Secretary of War *ad interim*. Thomas delivered the papers to Stanton in person and the latter made no offer of resistance but asked for time to remove his private property. Thomas, overjoyed at this peaceable ending of the matter, agreed, and returned to the White House to report to the President.

Stanton barricaded himself in his office, notified the House and Senate of the President's action, and had Thomas arrested for violation of the Tenure of Office Act. He was released on bail and demanded the office which Stanton declined to surrender. The President sent to the Senate the nomination of Thomas Ewing, General Sherman's father-in-law, to be Secretary of War. When the news reached Congress there was great excitement. The Senate passed a resolution condemning his action. In the House a resolution of impeachment was introduced, and as soon as the overwhelming desire of the members to make speeches could be gratified, it was passed by a strict party vote of 126 to 47, and thus the movement at last reached a climax.

The following day Thaddeus Stevens and John A. Bingham, on the part of the House, appeared in the Senate and 'in the name of the House of Representatives and of all the people of the United States,' impeached Andrew Johnson of high crimes and misdemeanors in office. A committee of the House prepared eleven articles which accused the President of high crimes and misdemeanors in connection with (1) the order removing Stanton; (2) the order appointing Thomas; (3) a conversation with General Emory in which the President had declared the Command of the Army Act unconstitutional; (4) three speeches of the President in which Congress was harshly criticized; and (5) his opposition to the execution of the reconstruction acts. All of these, except those relating to the Tenure of Office Act and the conversation with General Emory, had been rejected as inadequate cause in the previous attempts of impeachment.

The impeachment and the adoption of the articles were accompanied by the most furious and unrestrained abuse of Johnson, who was described as a Judas, a Nero, a criminal of blackest hue. Washburn of Illinois said of him:

'His whole official career as President has been marked by a wicked disregard of all the obligations of public duty and by a degree of perfidy and treachery and turpitude unheard of in the history of the rulers of a free people; his personal and official character has made him the opprobrium of both hemispheres, and brought ineffable disgrace on the American name.'

But the articles contained no charges to match this description. The House chose as managers to conduct the prosecution Thaddeus Stevens of Pennsylvania, Benjamin F. Butler of Massachusetts, John A. Bingham of Ohio, George S. Boutwell of Massachusetts, James F. Wilson of Iowa, Thomas Williams of Pennsylvania, and John A. Logan of Illinois.

On March 4, the House in a body presented the articles of impeachment to the Senate and the next day the Senate organized as a court, with Chief Justice Salmon P. Chase presiding, in accordance with the constitutional provision. The President was summoned to appear a week later and the stage was thus set for the final act of the drama. Eleven articles of impeachment were passed by the House.

(*To be continued in an early issue*)

Our Illegal Spenders

(*Continued from page 6*)

system is shown by a comparison of *the Federal budgets for the years 1925, 1926, and 1927, which have more than doubled in amount those of the three years preceding the war.*

The appropriation for the year 1927, amounting to $4,409,377,454, is a far greater sum than has been appropriated at any session of Congress since 1921 but, in that year, the Government was spending over $1,000,000,000 more than at present on an army and navy which had not been demobilized from war strength; and over $700,000,000 more than at present on railroad administration.

Leading all other departments the Veterans' Bureau furnishes an example of this type of unlawful expenditure, *through which the veterans are not in any respect benefited.* A comparison of costs between the War Department and the Veterans' Bureau for the single item of hospital construction shows that the latter department *expends from thirty-three to forty-five per cent in excess* for the same type and equipment of buildings, while other items of expenditure, which contribute nothing whatsoever to the welfare of the veterans, present an array of facts which places this bureau in the front line of the 'illegal spenders.'

Article XIV of the Constitution empowers Congress to pay only such public debts as are 'authorized by law.' Since the only law authorizing expenditure of public funds is the regular Appropriation Act, the present system of spending first and acquiring funds for payment after, as charged by the Controller General, does not afford protection to public money when exceptions to its operation are created by Congress, either before or after turning the money over to the spending agencies.

A casual study of the extent to which discretionary power is conferred in the disbursal of lump-sum appropriations illustrates the loose methods through which hundreds of millions of taxpayers' money is expended annually. Unitemized appropriations for public buildings, sites and construction, stretching from Maine to California, furnish interesting if somewhat startling reading.

The Controller General of the United States is charged with making investigations for Congress as to revenue, appropriations and expenditures, and is specially charged with reporting to Congress every expenditure or contract made by any department or establishment, in any year, in violation of law. The fallacy, therefore, of department heads conducting their own negotiations and making their own requests directly with Congress must be apparent when the law places direct responsibility for both approval and legality upon a duly responsible official of the Government.

The increasing tendency of government departments to effect payments of public moneys not authorized by law is openly charged by Controller General McCarl to be directly responsible for the loss to the Government of over $300,000,000 of public funds. He claims that after credit has been disallowed for illegal payments, department heads, through the medium of 'deficiency' bills, rely upon Congress for settlement of their unlawful and unauthorized expenditures.

The importance of such accusations from such an authoritative source cannot be overestimated.

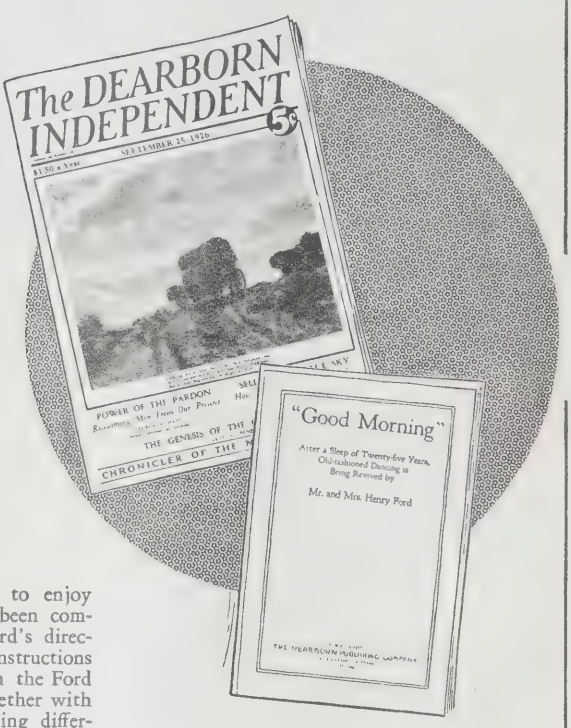
LEARN *to* DANCE *and Keep Young*



The DEARBORN INDEPENDENT
5¢
"Good Morning"
After a Sleep of Twenty-five Years, Old-fashioned Dancing is Being Revived by
Mr. and Mrs. Henry Ford

The Old American dances as revived by Mr. and Mrs. Henry Ford have created widespread interest.

To render it possible for everyone to enjoy these beautiful dances there has been compiled and published, under Mr. Ford's direction, complete information with instructions on each of the dances as taught in the Ford School of Dancing at Dearborn, together with calls, music and pictures visualizing different steps.

'Good Morning'

is the title of this interesting book. It contains 169 pages, carefully printed in clear type, and durably bound in attractive paper covers.

It also explains the origin and etiquette of the dances; style and deportment, and how to arrange and conduct a successful dance.

Subscribers to THE DEARBORN INDEPENDENT are now given an opportunity to obtain a copy of this popular book free. It regularly sells for 75c a copy, but for a limited time we are offering a copy of *'Good Morning'* in return for obtaining a new subscriber for THE DEARBORN INDEPENDENT.

Thousands of men and women are just waiting to be asked to subscribe to this great publication. Many of them are your own friends and neighbors. All you have to do is to secure one new subscription and forward it on the coupon below. We will immediately send you a copy of *'Good Morning'* with our compliments.

CHATS WITH OFFICE CALLERS

'The other night,' said ***the Head of the Household,*** 'I decided to take my family to the movies. I was influenced—in fact, persuaded—by one of those alluring advertisements that the magazines carry. You know the kind: the center of the page shows father and mother and the youngsters all smiles and hilarity because they're off for an evening of romance and adventure and what not at the picture palace. The advertisement made me wonder if perhaps I hadn't been a bit harsh, depriving my children of a lot of wholesome amusement by not taking them oftener. So I called my wife, and she called the children, and in a minute we were giving a good imitation of that happy family in the advertisement, all a-bustle with wraps and hats and excitement and anticipation for the fun ahead of us.

'Then I glanced over the amusement column in the evening paper to decide which show to see. We live in one of the largest cities in the country. It has, I understand, even more than its quota of imposing and elaborate movie theaters. It should offer as fair a variety of shows as any place in the land. Here are the pictures we found listed: *Altars of Desire; Don't Tell the Wife; Nobody's Widow; An Affair of the Follies; One Hour of Love; When the Wife's Away; Sorrows of Satan; The Popular Sin.*

'These may be very fine pictures. Perhaps the titles are misleading, and the plays themselves are innocuous. Perhaps they are perfectly fit for children to see. I cannot say; I cannot speak with authority about any of them. We stayed home.'

❦ ❦ ❦

'You receive letters from all over the world, I see,' remarked ***the Insurance Man*** as he glanced over the editor's desk.

'Do you remember the old-time letter of the busy executive beginning, "Yours of the fifth inst., relative to so-and-so has been received and acted upon"; then a long, rambling rigmarole touching on matters foreign to the subject? I was looking over some of our old records and came across letters written in the early eighties and they were truly funny. Now the modern preference shows a trend toward simplicity and directness and that is true both in letters and in the modern life we are living. The elaborate salutations and subscriptions to letters of Lincoln's time have now a flavor of agreeable romance. It would be interesting to know what the model business letter will be fifty years hence. And the letter from friend to friend will be as far advanced from our present stage as are the letters of today ahead of the letter grandad wrote back to New Hampshire from the wilds of the Ohio country beginning, "I take my pen in hand to tell you that I am well and hope that you are the same."'

❦ ❦ ❦

'There are thousands,' said ***the Assistant District Attorney,*** 'yes, probably many hundreds of thousands of stolen jewels hidden away in the safe deposit vaults of banks and trust companies in this country. They are safe hiding places in which thieves keep their plunder. Whenever we arrest a big jewelry thief and search him or his particular hiding place, we're sure to pick up one or more safe deposit keys. Such keys are not marked in any way and so we can't locate those particular vaults, and the thieves know it. They know that even if convicted and compelled to serve a term, they'll have a nest egg when they come out of prison. There is a way, however, to overcome this difficulty and locate the hidden loot, if the bankers would only agree to help us. That is, if they made it a rule to have their depositors fingerprinted, and marked the keys to their deposit boxes in some manner by which the police could identify them when these keys are found in the possession of criminals. Receivers of stolen diamonds often recut them; they remelt the gold and platinum, but there are jewels of a kind that can't lose their identity, and which the thieves don't dare intrust to fences. I'm certain that all this kind of stuff, and in addition, any amount of stolen negotiable securities, could be unearthed if the police and public prosecutors only had access to the safe deposit vaults in which they lie hidden perhaps for years.'

❦ ❦ ❦

A Fairly Well-Known Writer who is a much better-known speaker, dropped into The Office with malice prepense. It is the first time we ever knew him to come with a request. This time he wanted us to print something. It is a letter.

'Here,' said he, 'is a letter of my own composition which I expect to see greeted with country-wide applause from long-suffering Occasional Orators. It is in reply to a committee asking me to make an address on Lincoln's Birthday. I shall be obliged if you do not divulge the address. It is suitable for any committee the length and breadth of this great land. Here it is. Hand it down to posterity.'

So here it is, minus all marks of identification:

'Gentlemen: Your invitation to address the ———— Club at luncheon February 12 has been received. Let me say at once that I appreciate the honor implied in the invitation. I remember very distinctly appearing before the ———— Club on the same occasion last year. As I recall it, the luncheon was set for 12:30, with the address to open at 1:15 and close at two o'clock. The punctuality with which lunch was disposed of and the program opened by your resourceful president was most admirable. There followed a few moments of friendly chaff incident to the meetings of luncheon clubs, and then a nice girl was introduced to sing. I believe that she was the daughter of one of the officers of your club. Anyway, she sang beautifully and I joined heartily in "encore!" It was precisely the thing to precede a contemplation of Abraham Lincoln, our great saint and hero. I was congratulating us all on the happy harmony of the program.

'Then at 1:30, or a little after, your president announced that a patent piano would be demonstrated before the club. A piano salesman accompanied by three lady demonstrators surrounded an instrument which was presently put through a different kind of pace by each demonstrator. Without expert knowledge of such matters, I should venture to say that as a demonstration it was well done.

'At 1:55 a gentleman was called upon t show some ancient pictures, which he did, ac companying them with a running fire of joke which have somehow escaped my memory

'It was after closing time when th Speaker of the Occasion, as the program ha it, was called upon. An address had bee specially prepared on the written assuranc of the ———— Club that it was speciall desirous of commemorating Lincoln at tha meeting with a speech discussing his caree and principles. It was a good address, after ward widely published, but it was delivere at the tail end of patent piano demonstra tions and exhibition of flea-bitten pictures— it was delivered to men who were promise they could leave at two o'clock. True, the were courteous; they remained; they wer flatteringly attentive. I know enough o audiences to believe that they enjoyed i much more than I did. But you will no misunderstand me when I say that I canno subject either a Lincoln address or mysel to the risk of a recurrence of that experience

'I am, therefore, most respectfully, though thus frankly, declining your invitation.'

The Man Who Had Been Out o Work for four months came into th office for a job.

He told us quite cheerfully that he wa coming through the ordeal with severa well-learned lessons.

'We've managed to keep up the pay ments on our two-by-four shack and th washing machine, but we've had to let th extra lot and the sewing machine slide You see, we were altogether too heavily overloaded with installment payments Well, from now on we are going to pay a we go.'

❦ ❦ ❦

'I've just got back from Europe,' remarked ***the Traveler,*** 'and the most surprising thing I've seen is the number of stranded Americans drifting about Paris. You can find them everywhere; that is, wherever American tourists are likely to go. They're generally young people—young men and young women; most of them claim to be art students, but I suspect that by far the greater part are just adventurers, craving for a taste of life in the Latin Quarter, and drawn by the fame and the lure of Paris. It's possible to drift through the good old United States, looking for adventure and odd jobs, but that sort of thing can't be done in Europe. Most of these poor youngsters land in France with just enough money to get the boat train to Paris. Here's a bit of advice I want to give to all young Americans: "Don't go to Europe unless you have the price of a return ticket in your pocket." These stranded tourists and drifters have to be taken care of, of course, and there's an American Aid Society, which does what it can. I was told at their office that they were called upon to assist 3,000 stranded Americans in 1925, and in 1926 the number was 2,842. For the most part they're an honest lot of tourists, too, for of the money that was advanced to them, the sum of 120,825 francs was returned to the society after the stranded folk returned to the United States and communicated with their friends and families.'

CAN YOU TELL ME?

QUESTION: Will you give me a brief history of Kit Carson's life?

ANSWER: Christopher (Kit) Carson was born in Madison County, Kentucky, 1809. At fifteen he was apprenticed to a saddler; two years later he joined an overland trading expedition to Santa Fe, and became a trapper and roamer of the plains of the Rockies. In 1842, after the death of his Indian wife, he brought his daughter to St. Louis, Missouri, to be educated. Lieutenant John C. Fremont, U. S. A., was in the city at the time, preparing for his first expedition to explore the Rocky Mountains, and engaged Carson as guide. The next year Carson returned to New Mexico, married a Spanish lady and resumed his hunting and trapping. He was connected with the second expedition under Fremont and continued with him during the military operations which resulted in the conquest of California in 1846-47. Later he was appointed United States Indian agent for the district around Taos, New Mexico. Acting in this capacity he negotiated several important treaties. During the Civil War he rendered important services in New Mexico, Colorado and Indian Territory for which he was brevetted brigadier general. He died at Fort Lyon, Colorado, May, 1868.

ɤ ɤ ɤ

QUESTION: To whom do you apply if you wish to procure a concession at Yellowstone National Park?

ANSWER: Under the rules and regulations governing Yellowstone National Park, approved by the Secretary of the Interior, all applications for concessions in the national parks shall be filed with the superintendent of the park. The name and address of the superintendent of Yellowstone National Park is Horace M. Albright, Yellowstone Park, Wyoming.

ɤ ɤ ɤ

QUESTION: Will you kindly print a list of wedding anniversaries? I know that the tenth is tin, but of the others am not certain, and should like to preserve such a list for reference.

ANSWER: Following is a list of wedding anniversaries:

First—Cotton
Second—Paper
Third—Leather
Fourth—Fruit and Flowers
Fifth—Wooden
Sixth—Sugar
Seventh—Woolen
Eighth—India Rubber
Ninth—Willow
Tenth—Tin
Eleventh—Steel
Twelfth—Silk and Fine Linen
Thirteenth—Lace
Fourteenth—Ivory
Fifteenth—Crystal
Twentieth—China
Twenty-fifth—Silver
Thirtieth—Pearl
Fortieth—Ruby
Fiftieth—Golden
Seventy-fifth—Diamond

QUESTION: Is there a midnight sun at the South Pole? Who were the discoverers of the South Pole?

ANSWER: The condition known as the 'Midnight Sun' occurs in the Antarctic region around December 21. Roald Amundsen spent a few days more than a year in the Antarctic exploring, reaching the South Pole on December 14, 1911. Robert Falcon Scott, an English naval officer, reached the South Pole January 18, 1912, five weeks later than Amundsen, but perished on his way back to the home station (March 29, 1912) from starvation and exposure. His four comrades perished with him.

In this department we shall do our best to answer questions concerning Government and other matters. Write your question clearly. Sign your name and address. Your name and address will not be published. Answers will appear in a reasonable time after receipt of questions.

QUESTION: Precious stones and gems have certain significance, survival from the ancients, which it is customary and pleasant to observe in making gifts, particularly for birthday, engagement and wedding. Can you give me such a list of gems?

ANSWER: We are printing a list of the significance of the better known precious stones:

Agate—Insures health, long life and prosperity.

Amethyst—Preventive against violent passions.

Beryl—Everlasting youth and happiness.

Bloodstone—Steadfast affection, courage and wisdom.

Diamond—Signifies purity; maintains peace and disperses storms.

Emerald—Discovers false friends and insures true love.

Garnet—Constancy and fidelity.

Jasper—Wisdom and courage.

Moonstone—Good luck.

Onyx—Insures conjugal felicity.

Opal—An 'unlucky' stone portending injury and mental or physical trouble.

Pearl—Signifies purity and innocence.

Ruby—Discovers poison, corrects evils resulting from mistaken friendship.

Sapphire—Frees from enchantment; denotes repentance.

Topaz—Fidelity and friendship; prevents bad dreams.

Turquoise—Prosperity in love.

QUESTION: Please name some of the members of the British Parliament who opposed the war with the American Colonies in 1776.

ANSWER: Among the stanchest supporters of the American Colonists in the House of Commons were Edmund Burke, Colonel Isaac Barré and John Wilkes, who was expelled from the House because of his opposition to the government. William Pitt, the elder, spoke strongly against the harsh policy of the government toward the American Colonists, but when America entered into a treaty with France and it was proposed to remove the ministers and make a peace treaty on any terms, he appeared in the House of Lords and in a powerful address protested against the disruption of the Empire, although he was in a dying state, and passed away a few days later.

QUESTION: What are the maiden names of the wives of the United States Presidents?

ANSWER:

Washington: Martha (Dandridge) Custis
John Adams: Abigail Smith
Jefferson: Martha (Wayles) Skelton
Madison: Dolly (Payne) Todd
Monroe: Eliza Kortwright
J. Q. Adams: Louisa Catherine Johnson
Jackson: Rachel (Donelson) Robards
Van Buren: Hannah Hoes
Harrison: Anna Symmes
Tyler: Letitia Christian
Julia Gardiner
Polk: Sarah Childress
Taylor: Margaret Smith
Fillmore: Abigail Powers
Caroline (Carmichael) McIntosh
Pierce: Jane Means Appleton
Buchanan:
Lincoln: Mary Todd
Johnson: Eliza McCardle
Grant: Julia Dent
Hayes: Lucy Ware Webb
Garfield: Lucretia Rudolph
Arthur: Ellen Lewis Herndon
Cleveland: Frances Folsom
B. Harrison: Caroline Lavinia Scott
Mary Scott (Lord) Dimmich
McKinley: Ida Saxton
Roosevelt: Alice Lee
Edith Kermit Carow
Taft: Helen Herron
Wilson: Ellen Louise Axson
Edith (Bolling) Galt
Harding: Florence Kling
Coolidge: Grace A. Goodhue

ɤ ɤ ɤ

QUESTION: To settle a dispute, will you kindly print a list of birthstones for the various months?

ANSWER:

Garnet—January
Amethyst—February
Bloodstone and Aquamarine—March
Diamond—April
Emerald—May
Pearl and Moonstone—June
Ruby—July
Sardonyx and Peridot—August
Sapphire—September
Opal and Tourmaline—October
Topaz—November
Turquoise and Lapis-lazuli—December

I READ IN THE PAPERS

The Boston Curb Our Monte Carlo

The operations and methods of the Boston Curb call forth stinging denunciation from the *Financial World*, which pays its respects in this wise: 'Under the guise of an organized market a gambling hell is operated whose field for patronage is national in scope. It outrivals the far-famed European Monte Carlo in the size of its game and the annual rake-off for its proprietors. Our Monte Carlo is none other than the Boston Curb. In comparing it with its European prototype we must apologize to the former, for it must be said in its behalf it does not parade under an alias of respectability, but flauntingly avows it is a gambling resort in which at least the gamesters are not playing with marked cards or crooked wheels. Not even this meager defense can be offered for the Boston Curb—since there is so much evidence available to prove its willingness to act the tool for legally branded criminals to aid them to fool American investors through manufactured quotations that are unrepresentative of actual transactions, and thereby lure them into the pitfall of losses. One could well wonder how it is possible for such a market to thrive in Massachusetts, the home of the Pilgrims, the abode of Puritanism, the cradle of our Blue Laws and the last place in the country it would be supposed the criminal element, plying its trade in financial channels, would look to as a haven from which to carry on their swindles unmolested. There is not a thread of an excuse for the existence of the Boston Curb. As it is at present organized it is but the tool of financial swindlers. They have made out of it a national gambling place where the markers are all counterfeits and where those who enter its portals come out stripped eventually of their belongings, for the play is not honest.'

❦ ❦ ❦

An apple without seeds or core is being propagated in Canada. Elimination of the seeds causes the apple to grow more in length, so the name of sheep's nose has been given to it. If successful in bringing forth fruit from grafts from the parent tree, the new fruit will perhaps rival the seedless orange.

The originator of cold storage died the other day in London. He is survived by a large number of eggs.—Philadelphia *Public Ledger*.

❦ ❦ ❦

Where East and West Do Meet

We in America have our election troubles but we are not alone in this respect. The North China *Herald* says:

'The most amazing scenes are being witnessed at Calangute, a village of Bardez, where the elections for Portuguese India's representative to the Supreme Council for the Colonies is still in progress. This village, which is the talk of the whole colony at the present time, has become the resort of most of the political leaders of the country and is being visited by a large number of people from different parts of Goa. In this small village the election contest has degenerated into a battle royal. The electors are being practically driven to the polls, students, workmen and others being hurried to the village to record their votes. The most astounding incident of this election, however, was the imprisonment of two individuals, not for any crime or misdemeanor, but to satisfy the supporters of the favorite candidate that they were safely out of the way and who seized them for this purpose. The authorities were only able to secure their release the next morning. The whole village is now patrolled by the military. A Gilbertian situation seems to have arisen, judging from the local gossip, inasmuch as it is freely stated that the favorite candidate has secured about 1,200 votes when the total number of effective voters is slightly over 500.'

Washington now has both the Speakers—Tris and Nick.—St. Louis *Post Dispatch*.

❦ ❦ ❦

Eskimos Are Not Swimmers

Eskimos are expert water dogs so long as they remain in their kyaks. They hunt the frozen seas, battle high winds and bergs, tides and polar bears, are frequently capsized and right their craft by a dexterous movement of their bodies and paddles. But, contrary to the general idea, few if any can swim a stroke. An Eskimo employe at the Field Museum, Chicago, learned to swim in the tank of the Illinois Athletic Club, the same tank in which William Bachrach has developed a number of champion swimmers. 'No, no sir!' stated the Eskimo, 'We do not swim. The water is too cold even in the hottest summer time.'

Bacon as Chemist Vindicated

A secret formula for the production of salts of copper, found in one of Roger Bacon's alchemical works, has been proved effective by the University of Pennsylvania chemists, but too complicated to be of commercial value today. This formula has lain unused for more than 600 years. It was written in cipher, as were all Bacon's other secret formulas, as in the period in which he lived charges of witchcraft and sorcery brought against those who pursued science research were by no means uncommon, and Bacon had to suffer long imprisonment on account of some of his writings.

Roger Bacon is regarded as the greatest scientist of the 13th Century. He was a Franciscan monk and studied at the universities of Oxford and Paris. He is credited in Europe with the discovery of gunpowder, and he was one of the first to find out and test the principles of the telescope. He left behind him numerous scientific works. Roger Bacon is frequently confused with Francis Bacon, Viscount St. Albans, who lived several centuries later and was a contemporary of Shakespeare.

The Taxpayer Pays as Usual

The celebrity arrives in Manhattan; is escorted up Broadway amid cheers and the fluttering of confetti ticker tape from the brokers' offices above. The band plays. The mayor bows, makes a speech of welcome and presents the key to the city. All very impressive and wonderful, but not free by any means. Roughly estimated, the average expense incurred by the city of New York in officially receiving prize fighters, channel swimmers, queens and kings, is about $3,000 per reception, plus the wear and tear on the municipal band. Scrolls offering the freedom of the city, in very bad English, cost $935 each. Sandwiches and coffee for 250 'guests,' $335.50. Seventy-five heavy gold-plated badges for a reception committee; bill of $112.50. Why heavy plated for one day's use? And a gorgeous flashlight picture of Hizzoner and a celebrity costs the city $40. Freedom of the city but not free for the taxpayer.

The Perennial Pirate Treasure Hunt

Here and there across the Louisiana marshes one sees men digging for the buried treasure of the pirate Jean Lafitte. With maps and lighted torches they penetrate the darksome and silent bayous where the Spanish moss hangs in deep festoons from the jungle-like cypress and the bellow of the bull alligator mingles with the cry of the herons. For the hunters believe the buccaneer cached vast stores of Spanish doubloons and pieces of eight along the great coastal stretch southwest of New Orleans. One excited treasure hunter pulled up a post set by government surveyors, thinking that the stake was one of Jean's marks.

NOTES - COMMENTS - CRITICISMS

MR. FORD'S Page this week discusses the philosophy of business and its relation to human needs.

ɣ ɣ ɣ

The cover design consists of a striking cartoon by C. H. Sykes. It is a characteristic and incisive bit of work.

ɣ ɣ ɣ

Does anyone, these days, believe in the man in the moon? Yes, thousands of people do. But they are unaware that the moon is a vast desert, with no water, no atmosphere, and not a green thing growing. A bad place for any man, especially a farmer. Professor Moulton gives us a close-up of this nonproducing orb. (p. 1)

ɣ ɣ ɣ

What is the matter with Mexico, and while we are at it, what is the matter with this country? The president of the Rotary Club of Mexico City in a message addressed to American Rotarians supplies an answer. He says: 'True international fraternity can exist only when based upon absolute confidence,' and he thinks that the only fighting that ought to be done is an attack on the lack of confidence that at present exists. (p. 3)

ɣ ɣ ɣ

'The only time that a President of the United States has been suspected of being a party to the assassination of one who had previously held the office.' This sounds like a bit of the Middle Ages, but it isn't. The inner story of the impeachment of Andrew Johnson is told for the first time by J. G. de Roulhac Hamilton. (p. 4)

ɣ ɣ ɣ

To assert that hundreds of millions of dollars are illegally expended by administrative officials of the United States sounds rather startling. The channel through which the money comes is the so-called deficiency appropriations. If the allotted spending money runs short Uncle Sam is 'touched' for a further amount. It is a case of expending public money first and collecting through Congress afterward. (p. 6)

ɣ ɣ ɣ

'Thou shalt have no other gods!' says the football enthusiast. 'But there *are* others,' declares the baseball fan; 'and still others,' exclaims the devotee of ice hockey. The idols of 'the slashing game' have now been set up in the gallery whether the other gods like it or not. 'No game we know of is better suited to the American sports taste than hockey,' says H. G. Salsinger. (p. 7)

ɣ ɣ ɣ

According to Donald A. Laird, people can't always believe their own ears. When you think you hear somebody speaking in front of you, it may be somebody behind you, and vice versa. 'Ghosts of sound,' one might call it. They haunt some people. (p. 8)

ɣ ɣ ɣ

What Burns calls 'wee tim'rous beasties' seem to vanish from the face of the earth with the first snowflake. Where do they go? During the winter they inhabit worlds we know not of, like so many furred and feathered Rip Van Winkles. This is called hibernation. S. F. Aaron tells us all about it and makes some excellent drawings as well. (p. 12)

ɣ ɣ ɣ

Fiction this week is well represented by Hugh Walpole's *Adventure of the Imaginative Child*. Not a child of the imagination, mark you. There is a big difference. This boy is worth studying. (p. 16)

ɣ ɣ ɣ

Perhaps no more prosaic name was ever applied to a weapon of war than 'tank.' Guns, bombs, batteries, all suggest the turmoil of battle, but the tank is all three combined. It is the modern war horse which has the famous Trojan steed completely beaten. (p. 22)

ɣ ɣ ɣ

Here are some more opinions of our readers:

526 W. Superior Street
Alma, Michigan.

Here at college one does not have much time to read outside material. But if I must let all others go, I at least try to read part of your magazine. None other seems so refreshing and so stimulating to the mind.

At numerous times I do not agree with your writers, and sometimes the disagreement is quite marked, but such helps to develop my own arguments and reasons.

However, I also agree with many more of the writers. And I wish to compliment the paper on its stand on prohibition. On several other stands I am not so sure of myself, but your men make clear their side of the question so that it cannot help be understood.

Perhaps these lines will seem rather a dubious compliment, but I wish to say that I prefer your magazine to all others.

CHARLES MINIS.

ɣ ɣ ɣ

1701 Main Street,
Reading, Ohio.

I was rather surprised to read your recent editorial criticizing Judge Landis for his handling of the baseball scandal. You, the Chronicler of the Neglected Truth, riding a man for publishing the truth kinda makes me want to rare back on my hind legs and let out a howl in defense of what I always considered a square-shooter.

Nevertheless I will remain an ardent reader of your magazine considering that we are all hasty at times and make mistakes. If you did not get a kick from your readers once in a while you'd be a darn poor editor.

I am a semi-professional umpire and take pride in announcing the fact that in all the baseball scandals and so-called scandals you have never heard of an umpire accused.

Yours in friendly criticism,

CARLOS V. DILS.

ɣ ɣ ɣ

Center, Texas.

Please permit me to have a short talk with you in regard to your famous paper (THE DEARBORN INDEPENDENT).

I have been a reader of it for about three years and never yet missed a copy. Will say that I enjoy it immensely.

With regard to your Briefly Told page, I have each one of these pages in a binder and treasure them highly.

The main reason why I prize your paper so highly is this: I used to be an habitual cigaret smoker, and reading an article in your magazine from a doctor that used to write regularly three years ago, caused me to discontinue the use of same. I think this alone is worth everything that it has cost me, as I am still quit. And had been smoking for fourteen years.

ELVIN F. SANDERS, JR.

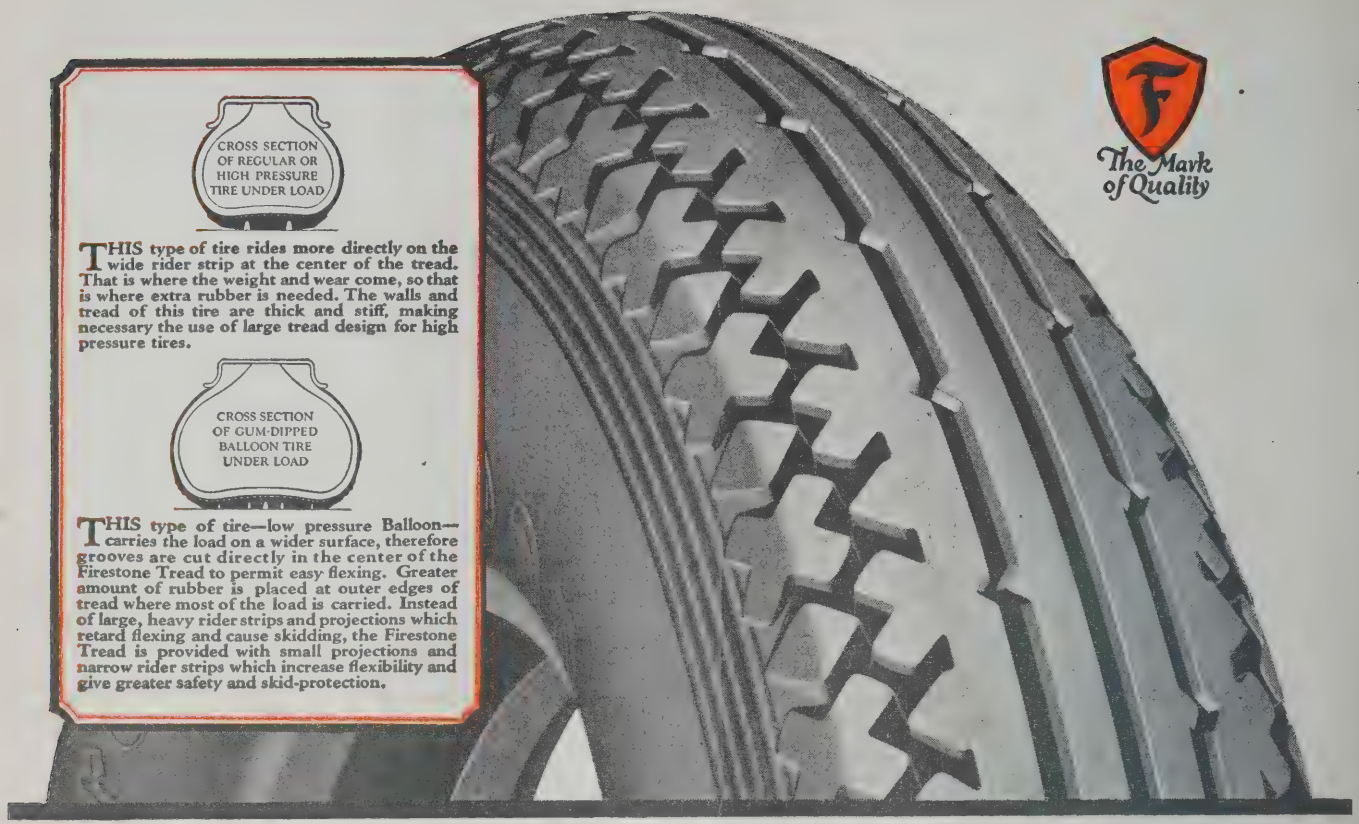
AMERICANS ABROAD—Homer Croy



CROSS SECTION OF REGULAR OR HIGH PRESSURE TIRE UNDER LOAD
THIS type of tire rides more directly on the wide rider strip at the center of the tread. That is where the weight and wear come, so that is where extra rubber is needed. The walls and tread of this tire are thick and stiff, making necessary the use of large tread design for high pressure tires.
CROSS SECTION OF GUM-DIPPED BALLOON TIRE UNDER LOAD
THIS type of tire—low pressure Balloon—carries the load on a wider surface, therefore grooves are cut directly in the center of the Firestone Tread to permit easy flexing. Greater amount of rubber is placed at outer edges of tread where most of the load is carried. Instead of large, heavy rider strips and projections which retard flexing and cause skidding, the Firestone Tread is provided with small projections and narrow rider strips which increase flexibility and give greater safety and skid-protection.
The Mark of Quality

Scientifically Designed
BALLOON TIRE TREAD

Another Reason why Firestone Tires are Better

When Firestone engineers were developing the Balloon Tire they found it necessary to design a tread altogether different from that which is required by High Pressure Tires. The tread of a Regular Cord, or High Pressure Tire is usually designed with what is known as a wide rider strip at the center. Here the bulk of the rubber on the tread is concentrated.

With the Balloon or Low Pressure Tire this extra amount of rubber must be placed away from the center toward the outer edges of the tread. Because of the low pressure conditions the displacement is greater and most of the weight and wear is at these outer points.

Notice how the Firestone Balloon tread has a deep groove at the direct center, with narrow flexing rider strips and additional grooves on either side. These grooves nearly close up when the tire is under load, as they provide room for the rubber to spread out. Next come the outer rider strips—at the points of greatest wear—with numerous angular sharp-edge projections for non-skid qualities.

The Firestone tread was not designed with large, massive projections for appearance or to make plausible sales argument. On the contrary, the projections of the cross-and-square tread are small and the rider strips narrow, permitting the tread to yield to depressions and cling to the road, giving the greatest non-skid surface. This tough, pliable tread has the wear-resisting qualities that give thousands of extra miles of service.

The tread, however, is not the only important part of the Balloon Tire. Such a tread as this, designed to yield to every depression of the road, must be placed on the carcass that also has the qualifications to withstand the terrific flexing that this design tread permits. Firestone provides this extra strength and endurance by dipping the cords of the carcass in a rubber solution. By this process, every fiber of every cord is saturated and insulated—to withstand the extra flexing of the Firestone tread.

If you want the economy, comfort and safety of Gum-Dipped Tires—see the nearest Firestone Dealer. He will gladly explain the many features that make Firestone Tires better.

If CHRIST *Came to* Constantinople

By WILLIAM E. (PUSSYFOOT) JOHNSON

IF CHRIST should come to Constantinople, He would find that ninety-five per cent of the liquor shops were perated by 'Christians.' e would find that of the 71 surveyed beer halls four ere conducted by Turks, ne by a Kurd, one by a ew and 465 by so-called Christians,' nearly all reeks or Armenians. He ould find that these beer alls conducted by 'Chris-ans,' as described by a gh Christian authority, are ather disreputable places.' e would learn that of the 413 'saloons' or drink shops rveyed, 1,169 were oper-ed by Greeks and only 97 Turks.

If Christ came to Con-antinople, He would find at, of the 175 registered othels, only 11 were run Turks. Of the others, 79 ere Greek, 35 Armenian and 45 wish. He would find that, of the 171 registered prostitutes, 1,367 were 'hristians and Jews' and only 359 ere Moslems, the remainder being nclassified. He would find in this erwhelmingly Moslem city that the ople who professed His name had a ractical monopoly on every disrep-able trade or occupation in the entire ty. Even the gambling prevalent in e city is confined almost entirely to ople who class themselves and are assed by others, as 'Christian.'

For all these dismal facts, Christ uld not be dependent upon any gan or Moslem source for His in-rmation. He would find them all ntained in a book, *Constantinople of oday*, a 418-page survey of Con-antinople by Professor Clarence John-n, head of the department of sociology Robert College, with a foreword Dr. Caleb F. Gates, president of at institution. While this volume as published by Macmillan's in 1922, e same facts exist in an accentuated gree today, as I found them on my cent annual visit to the Bosphorus.

THE chief obstacle to the spread of Christianity is not Buddhism, not Hinduism, not Mohammedanism, not even paganism; it is the rotten behavior of people who call themselves 'Christians.'

I know of no one who comes nearer to literally living up to the Sermon on the Mount than Mahatma Gandhi, the Hindu. The devoted life and character of Madame Safie Hussein Bey of Bostondji will not suffer by comparison with the finest of our Christian women, and yet she is such a devout follower of Mohammed that her Gentile friends called her a 'Presbyterian Moslem.'

Christ was not joking when he laid down the principle—'By their fruits ye shall know them.'

And even worse! Four years ago, when Turkey got the Powers to accept the annulment of the capitulations whereby other countries participated in the government of the country, and became thus practically free, one of the first acts of the national assembly was the enactment of a prohibition law. This law Turkey progressively put into effect—in Cilicia when the French evacuated that section, in Smyrna when the Greeks were driven into the sea, and in Constantinople when the Allied troops abandoned that place.

IT WAS then that the Powers raised a rumpus, for the revenue from the liquor traffic had been formerly pledged to an old international trusteeship that had control of the Turkish public debt. Under this pressure from 'Christian' powers, Turkey restored the drink shops which are now scattered all over the city.

But the drink traffic, repugnant to the Moslems, was something with which they did not care to soil their fingers directly. So a 'monopoly' of the trade was granted to a company of Polish Jews who agreed to pay a large sum of money down—but didn't. An arrangement was made, however, whereby the concessioners managed the monopoly in behalf of the government.

Then followed the next move. A company of 'Christians' from Italy were given a sort of gambling monopoly, whereby Yildiz Kiosk, the former palace of the Sultan, was turned into a kind of Monte Carlo. For this concession the Italian 'Christians' pay a yearly tribute of 30,000 Turkish lire. In theory this concern was intended to attract the visits of 'Christian' tourists far and near, lambs who would flock hither to be sheared—to the great profit of Turkey. Moslems were positively forbidden to visit this place of iniquity, which was intended solely for the recreation of 'Christians'—so they said.

The thing appears to be working quite well. One young diplomat recently was skinned out of all that he had and committed suicide in approved Monte Carlo fashion. One of the principals who labored for the establishment of the institution is Younnous Nady Bey, member of the national assembly and editor of *La Republique*.

While I was in Constantinople, Mr. Nady Bey went out to Yildiz Kiosk to see how the affair was running. He went out with a fair-sized roll, but got bumped for every sou he had. In great indignation he then wrote a two-column sulphurous roast in *La Republique*, denouncing the 'robbers' roost' that he had so diligently labored to establish. He says that twenty of his friends were skinned in the same ruthless manner. But in the working out, two solemn truths have developed: (a) outside tourists are not at all attracted to the concern, as they can lose their money just as well at Monte Carlo, and (b) the Moslems violate

the injunction to stay from the nefarious place, and so it is the Moslems themselves who are mostly getting skinned, instead of the 'Christians' as intended. That is why practically every Turkish newspaper is now attacking the concern.

AND here is another lugubrious situation that would stare Christ in the face should He visit Constantinople: Holy Trinity Church, the principal 'Christian' church in Constantinople, formerly owned a half-dozen saloons. These were closed by the prohibition law. But when the drink shops were restored, the stubborn Turks refused to restore the church's liquor licenses. Now Holy Trinity authorities are rending the air with cries of indignation at the 'outrageous injustice' in withholding these rum licenses.

Not one jot or tittle of what I have here set down applies in any degree to any American educational or missionary enterprise existing or that ever did exist in Turkey. It is really these American mission schools and colleges scattered throughout the Near East, pouring into that social caldron an annual grist of 3,000 graduates, that is now remaking and recreating the entire Near East. Since the days of Paul, no missionary enterprise has ever accomplished such far-reaching results as have been achieved by these American institutions throughout that whole country for a thousand miles south of the Danube River.

But the complication lies in the fact that *these American schools are not looked upon as 'Christian' institutions.* When a Turk visualizes a 'Christian,' he has in mind a Greek or an Armenian or some sect with whom he has had trouble for half a century. These American teachers and missionaries are simply 'missionaries,' and as such are loved and protected by the Turkish people and the Turkish Government. But the 'Christians' are regarded as a bad lot. These American schools and colleges are now more prosperous, better attended and better protected under the new Turkish Government than they were when they looked for their protection to an outside power—even to America. The Turkish Government is now actually paying for the education of a large number of Turkish children in these American missionary schools. Nothing in my lifetime has ever made me quite so proud of my country as to see these Turkish children and their parents, clamoring for admission into these Yankee missionary institutions. I am sure that Christ Himself would be well pleased at this, even though some of His blasphemous followers had got Him in bad by their scandalous behavior.

If Christ should walk down the Rue de Sublime Porte in Stamboul—the Fleet Street of the Orient—He would naturally make some inquiries about the 'massacres,' for every living man, woman and child from Hell to Oshkosh has heard these wretched stories from birth. It is always some bloodthirsty Turk butchering some helpless Christian man, disemboweling some Christian woman or throwing a Christian's baby to the bottom of a well.

'Atrocity stories have been vastly overdone; some of the more recent massacres have been wholly non-existent,' said William T. Ellis a short time ago. Nobody will challenge Ellis' cautious utterances nor his intimate knowledge of the Near East. It is these ghastly stories that have again and again set the world on edge. It was these stories that set the great Gladstone roaring in the British Parliament. It was these stories that caused Reverend Joseph Parker to pound his pulpit in the City Temple, London, and to declare, 'The Sultan! The Sultan! I say it reverently, God damn the Sultan.'

And yet God knows, there have been massacres—bloody, cruel, bestial, horrible massacres—plenty of them. But to locate the blame is another and more complicated matter. It is quite easy to charge the whole miserable business to the account of the Turk,

Pen-and-ink impression by GERALD VAN DER HEYDEN

and get away with it, for the rea that there are practically no Turks America or England to tell their sto while there are plenty of vocal Ar nians and Greeks ready to execut ghost dance whenever an open presents itself. And we are told by s a distinguished authority in N East affairs as Alexander Powell t 'during the period 1914-22, as ma Moslems were massacred in Asia Mi by Armenians and Greeks as there w Christians during the same period.'

AS A matter of fact, the Armenia Greeks and Turks lived together that country for 600 years with more serious trouble than the chro local squabbling between the Ch tian sects. As a matter of fact, th were no massacres in this section u the past sixty years when outs powers began claiming the right 'protect Christian minorities' in Turk And while claiming the right to 'p tect,' they never protected anything anybody. They merely used s claims for political and selfish purpos These troubles had their origin in t Treaty of Adrianople in 1829, when t Christian population of Turkey w placed under the protection of Russ Immediately Russia began to g Russian citizenship to any Turk subject who cared to visit Russia. S flooded the country with secret em saries stirring up trouble, organizi secret societ and urging t Armenians revolt, prom ing aid. T Armenia would revo again and aga but no prote tion was ev rendered by t Russians. The revolts we suppressed the usual rut less orient fashion by t Turks. Russ was merely see ing to create Irish situati in Armen striving for pretext to o cupy the cou try and open her way to the sea.

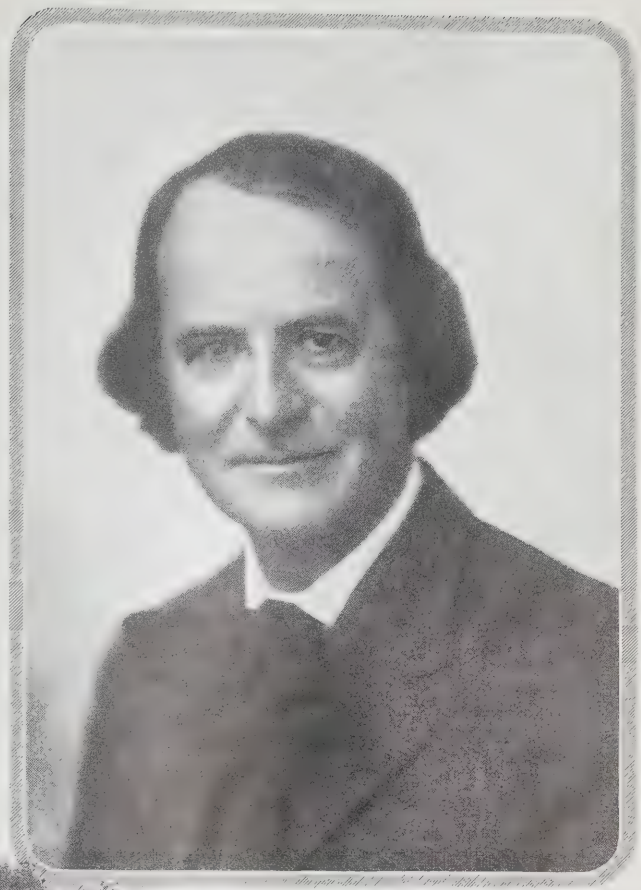
By the Treaty of San Stefan following the Turko-Russian War 1877-78, the six signatory powers to the place of Russia as the protectors the Christian minorities. The s signatory powers then began sy tematically to play the same gam each plotting for her own interes France claimed the 'right' to prote the Catholics, England claimed t 'right' to protect the (*Continued on page*

Intimate Glimpses *of* ELBERT HUBBARD

A Unique Genius *Without* Parallel *in* Literature

By JAMES W. BECKMAN

HIS SECRETARY



The genius of Elbert Hubbard caused him to be a continual subject for photographers. Portraits of the man do not always present him in this amiable, whimsical mood, for very often he was somber and morose in facial expression.

Print shop on the grounds of the Roycrofters, at East Aurora, New York. Here are produced the books for which the organization is famous.

ELBERT HUBBARD was born on a farm near Bloomington, Illinois, June 19, 1856. His father was a country doctor whose income never exceeded ve hundred dollars a year. Elbert as named 'Elbert Green Hubbard,' fter the same Baptist minister as lbert H. Gary. The name 'Green' ter suffered eli- on.

Elbert left chool at fifteen ith a fair hold on e three R's; and is education in anual training had een good. He new all the forest ees, all the wild nimals in his sec- on of the country, very kind of fish, og, fowl or bird at swam, ran or ew. He knew grain nd vegetable, and eir comparative values. He knew the ifferent breeds of cattle, horses, sheep nd swine.

He broke horses to saddle and arness; could sow, plow and reap; and new the mysteries of apple butter, umpkin pie, pickled beef, smoked de meat, and could make lye in a ach and formulate soap.

He was a bright, strong, active ountry boy who had been brought up o help his father and mother get a ving for a large family. 'I was not so ensely ignorant,' he said. 'Don't feel orry for country boys: God is often n their side.'

At fifteen, he worked on a farm and id a man's work for a boy's pay. He id not like it and told the man so. he man replied, 'You know what you an do.' Elbert replied, 'Yes'; and went estward and became a cowboy. When e tired of this he went to Chicago nd worked in a printing office. He eddled soap from house to house, shoved lumber on the docks, read all the books he could find, wrote letters back to country newspapers, and finally became a reporter.

Then he obtained a job as traveling salesman. He taught a district school and read Emerson, Carlyle and Macaulay. He worked in a soap factory, read Shakespeare and committed most of *Hamlet* to memory with an eye to the stage. He became manager of the soap factory, then partner. It was at this point that he evolved an idea—the club or coupon profit-sharing plan of selling merchandise—that put the concern on the road to millions. He knew it would make millions; but he did not want them. He sold his interest for $75,000 and went to Harvard College.

In letters to his mother at this time he revealed his hopes and ambitions.

'I think,' he wrote confiding his aspirations to her, 'that I can do bigger things than peddle soap.' Elbert Hubbard loved his mother and never neglected her with all his work. He remained but a short while at Harvard, long enough, he said, to realize the worthlessness of a college education for him. Of course, that was in the days before colleges provided the practical courses of the present time. He tramped through Europe, wrote for various newspapers and penned two books, for which he could find no publisher.

He returned, taught night school in Buffalo, New York, and then made a second pilgrimage through Europe. It was on this trip that he met William Morris and found the inspiration for his life work. He came back to East Aurora and started 'Chautauqua Circles.' He studied Greek and Latin with a local clergyman; raised trotting horses; wrote *Little Journeys to the Homes of Good Men and Great.*

'I am a graduate of the University of Hard Knocks,' he said, 'and I've taken several postgraduate courses. I have worked at five different trades enough to be familiar with the tools. In 1899, Tufts College bestowed on me the degree of Master of Arts; but since I did not earn the degree, it really does not count.'

Elbert Hubbard was never known to be sick. He (*Continued on page 26*)

What is it that takes American citizens abroad? America likes Europe because it is the homeland.

Where AMERICANS *Like to Go When in* EUROPE

By HOMER CROY

Illustrated by BETTY JANE KIDD

AS IT is all the fashion these days to start off an article, speech, radio address, or what not with an anecdote, I suppose I had just as well bow to the inevitable and get it over with as soon as possible. Then we can get down to the serious and scholarly things that lie ahead of us. The anecdote referred to is an old and popular one. Some humorous anecdotes flower and have their being for only a brief period, while others survive season after season, regardless of the winters. They are what florists call hardy perennials. Here it is:

As a train drew into a city in Europe, the doors of the carriages were flung open, the cry of porters rose and from one of the carriages two worn women looked languidly out upon the scene.

'Mother,' said the younger, 'what town is this?'

The mother looked at the scene a moment.

'What day of the week is it?' she asked wearily.

'Thursday.'

Picking up her itinerary book, the mother turned through it.

'Then it's Rome,' she replied. 'We get off here.'

That is the way the average American tourist is conceived, but I must say that I do not find him that way at all. When I first began to mingle with him, I thought that I would have to be ashamed of him. I had heard how loudly he talked, of his arrogance, his absurd questions, his display of money, but the more I saw of him the better I liked him. He stacks up just mighty well against the tourist of any country in the world.

If there is so stodgy a set of human beings in the world as the English tourist in the Riviera, the vaunted leisure class of England, I haven't met them. Personally, I like the Englishman on his native heath, and when he comes up in the conversation I get out my adjectives, but the superior, doddering set on the Riviera I can readily dispense with. It seems as if England, each winter, rounds up its dullest and most uninteresting people and bids them Godspeed to the Riviera.

I was one of the tourists last summer, and the summer before and the summer before that, except possibly that I stayed longer than the average person. In fact, one stretch was twenty months, and during that time I had a chance to see America. Indeed, the ship cynic said, going over, that the way to see America is to get a chair at the Café de la Paix.

Ray Long, who guides the destinies of the Hearst magazines, said that he had to come to Paris to see American authors. But that is neither here nor there; personally I saw him looking for them in some unusual places. Only an editor of great fame and endurance would have expected to find them in some of the places he searched so thoroughly. But let us be on.

Paris!—that is the place American abroad head for. Two-thirds of the passenger list of an Atlantic steamer pile off at Cherbourg or at Le Havre leaving the other third to go on to England. Of course, many of the passengers who head for Paris run over to England during their trip, but it shows which place they want to see first. The big lure abroad is Paris and I wish I could say that the lure is the Louvre, but I'm afraid I can't. Practically all Americans do go to the Louvre; practically all Americans see the 'Mona Lisa,' the 'Winged Victory' and the 'Venus de Milo.' Here I'll stop and make up my own statistics: only one in 52½ miss going to the Louvre but for length of inspection and time spent, Montmartre wins without a struggle.

Suppose, next March, the doors of the Louvre were nailed up just about the time we Americans were making our plans about going abroad for the summer—do you think that the presidents of the steamship companies would turn gray in a single night? Your answer is correct. But suppose that the chamber of deputies got together and unanimously decided—for

ce—that Montmartre showed France at a disadvantage and that not a or in that famous section should en during the summer season and at Heaven, Hell, The Black Cat and e Moulin Rouge should become the sting places of spiders—do you nk that all would be peaceful and ene in the high ces of the ship- ng companies? *n, non, monsieur.* would make the lentino funeral m as quiet and subdued as a dnesday-night yer meeting in w Brunswick.

In addition to floods of Ameri- ns who pour into nce, there are ny Americans o live perma- ntly in that thriv- city, so many, fact, that they port three daily erican newspa- rs, the best own of which is the Paris tion of the New York *Herald*. So ny of these Americans are there t they have a bustling chamber of mmerce, a Who's Who, clubs of their n and factions. And there is more erican ice cream consumed within minutes of the Place de l'Opera n in all England. In fact, I believe t a person could go so far as to say t Paris is more American than ndon.

Never in history did the Parisian cafes do such business as last summer.

WHAT is it that takes good, stalwart erican citizens abroad in such rid flocks? I mean, in addition to night life. Some people say, the nks. But we thinkers must admit t it is not necessary to go all the to Europe for *that*. Another wer is culture. But there are those tistics just quoted about night life. ers say that it is our restless spirit. t, I expect, with money to give it gs is getting pretty close to it. Also ther item that I might mention le we are about it is the constant am of information flowing over here n Europe. An example: There are nty-four American correspondents newspapermen in France sending k material about France and Europe. re are two accredited French cor- ondents in America.

But back to that fascinating sub- —drinking. The popular idea of se who stay at home is that tourists oad sound like neglected goldfish, that just as soon as they get past twelve-mile line they start in to nk themselves to a glorious death. ls is not true. There *is* a rush for ship bars, but much of the sin consumed is lemonade, beer and sarsaparilla.

American tourists drink more correspondingly at the ship bars than they do in Paris; the bars enjoy a lively trade going over, but bars bound west haven't a rush of business in spite of the desert the weary travelers are entering. Another superstition is that as soon as American tourists touch feet to French soil they head straight for the Ritz bar. It is true, they do head for that famous place, but it is not so much to drink as to see. And, of course, be seen.

A great attraction there is the ladies' bar with its potato chips—and its lady with the lifted face. Once she was a well-known actress in America. There is nothing quite so pleasant to people as to see ladies busily sipping cocktails at a public bar and to look surreptitiously at a lifted face. If the lady with the lifted face no longer appeared at five o'clock in the afternoon, trade at the ladies' bar would be in a frightful condition.

Americans abroad like Paris much better than they do London, or any other European city. If a vote were taken for the most popular city among Americans, it would run: Paris, London, Rome, Berlin. But during 1926 Americans fared the worst ever known in Paris from the standpoint of unpleasant happenings. Usually Americans are in great favor in Paris; there is no commercial rivalry between France and America and then l'Américain he geeve ze tip, but last year he also charge le debt, and that is something else, *n'est ce pas?*

Several unpleasant instances rose during the rush season. The franc was sick; the poor Parisian was driven from his favorite café; great *char-a-bancs* loads of millionaires, as all Americans are in France, came roaring down the streets so that the native Frenchman had to run to cover. Now and then these Frenchmen said things, they put out their tongues; once or twice they threw things, and a few of our folk got excited. But it was not serious; if we owed as much money as France and had to vacate our favorite hotels and restaurants and theaters to millions of rich Lamas, we'd have done more than shake a few fists and use words undreamed of by the fundamentalists. Lafayette would have turned in his grave.

IN FACT, so completely was Europe Americanized during the summer, when the tourist tide was highest, that one earnest American from California tried to start a booster club in Paris and London. He was that worst-of-all American—A Man with a Message. He wanted to make Europe over according to the best ideas of San Francisco. No higher compliment could be paid London and Paris than to say there was no violence.

If there is an outstanding fault that we Americans have (here among ourselves we'll pretend that we have only one) it is our desire to make the rest of the world over the way we want it. Nobody wants to be made over, least of all does he want it when some hearty brother rushes in and tells him to do it the California or Ypsilanti or what-not way.

Never in all history did the cafés, restaurants and the night places of Paris do such a business as last summer. But 1926 (*Continued on page 23*)

An enterprising French restaurant put up a sign—'Quick Lunch.'

—International New
Ovation for Gertrude Ederle at New York Ci

Why So Many of Us Behave Like IMBECILE

By GEORGE HENRY PARRISH

RADIO and the movies are taking off the lid and enabling us to see ourselves as we are. Never before was such an opportunity possible. What we see is not exactly pleasant. In some respects it is horrible. If we were to accept it as a finality, as the best of which we shall ever be capable, we might well dismiss the human race as something not worth bothering about. But there is another way of looking at it that gives rise to quite a different set of thoughts. It enables one to see that a world much changed is coming upon us; a better world and a happier one.

Let us look at ourselves as we are before considering what we shall be.

Last summer a young New York woman named Gertrude Ederle swam the English Channel. When she returned to New York she was given the greatest reception that the city had ever accorded to a human being. Grant had returned to New York from his trip around the world; Dewey had sailed up the Narrows after winning the Battle of Manila; Foch and King Albert and a long list of eminent men and women had come to the Western Continent's largest city and been welcomed in a manner that was supposed to be in keeping with their importance. But it remained for Gertrude Ederle to elicit from her home town such a welcome as none of these had ever received. What Grant could not get in numbers and enthusiasm was given to her, and what was denied to Dewey was hers without the asking.

What was it all about? Nothing except that she had propelled herself through a certain distance of water, using her body as a ship, her arms as blades of propulsion and her heart as an engine. No other woman had ever done it, though one did so a day or two later, and few men had ever done it—but what of it? Few men and women have ever tried to swim the English Channel. Most men and women can think of something better to do. If all of the human race were, at a certain time of life, to be hurled into the English Channel, the probability is that a great many of them would get across. But if all the men in the world were to be given a try at Edison's job, or Marconi's job, or the jobs of some other men who have done something worth doing, very few of them would 'get across.' And if all the women in the world were to be given a chance to be Harriet Beecher Stowes, Susan B. Anthonys or Madame Curies, probably but a few of them would make the grade.

To do anything worth doing in this world one must have something in his head, and the more one has in his head the less likely he is to try to do something that requires only unusual pow in his heels, his arms or his heart. great man or great woman has e tried to swim the English Chan or beat up somebody in a prize fig Such tasks are left for those who win at nothing else. Which is me as no slap at Gertrude Ederle or M Corson. Both these women have r faces and are undoubtedly fine wom who are loved by their friends, as th should be, because they have fi qualities than were required merely kick their way through so many m of water.

BUT New York did not break records in applauding Miss Ede and give more than a queen's welco to Mrs. Corson because these wom were fine women. It welcomed th because they exhibited great skill a endurance in performing a useless a New York and the whole country packed with men and women w exhibit great skill and endurance performing an infinite variety of use acts—acts that can spring only fr the purest recesses of the human he yet these men and women never ge hand.

New York went crazy over M Ederle because she had done someth that a great number of New York could understand. Nobody appla what he cannot understand—such thing would, of

Housing an Army in Hovels

Permanent Shelter *for* Troops *May Not Be* Ready *in This* Generation

By MARIAN BRUCE CLARK

FACTS concerning neglect of the United States to provide adequate shelter for its army have recently been forced upon public notice. They are: That 40,000 officers and men have been living since the close of the World War under inadequate shelter; and that Army officers are resigning from the service in alarming increasing numbers because of these conditions.

During the calendar year 1925 there were 171 officer resignations and to the end of the fiscal year June 30, 1926, there had been 95 of which 18 per cent were Infantry and 18 per cent Air Service. Figures of such dimensions invite inquiry as to cause since their effects are injurious to the efficiency of the Army.

As early as 1924 the attention of Congress was directed to army housing conditions, and the Secretary of War was directed to submit to Congress a comprehensive plan for necessary permanent construction of military posts, based upon the utilization of funds available from the sale of War Department property no longer needed for military purposes. The result of this survey disclosed that an appropriation of $110,000,000 would be required for permanent construction of necessary barracks and hospital facilities to get the men out of the canvas tents and wooden shacks in which they have been living, in all seasons, during the past nine years.

Officers' quarters made from old barracks. Seams are open in floors and weatherboarding fails to keep out rain.

Although repeated hearings have been conducted before Congressional committees during the past two years, nothing that can be construed as even approximately adequate has been done to remedy these deplorable conditions and the Regular Army must spend another winter in tents and in leaky, insanitary shacks altogether unfit for human habitation.

Ramshackle N. C. O. quarters at an Army post in the South.

The type of huts in which some 40,000 officers and men with their families have been quartered at the twenty Army posts throughout the country, since the close of the World War, were erected in 1917-1918 as temporary war-time construction and were intended to answer only emergency purposes during the process of demobilization. Since the gravity of this situation has been before Congress that body has increased its own salaries; provided liberal appropriations for the construction of administration and office buildings; and allowed generously for other exigencies not at all comparable to the crying needs of an inadequately sheltered and rationed Army.

Under the installment plan system which dependence upon sales of War Department property provides, it is safe to predict that the present generation, to say nothing of the present Army, will not live to see its completion. The appropriation of $5,770,000 granted by the first session of the 69th Congress, when applied to a $110,000,000 program and spread over twenty equally dilapidated Army posts, leaves the situation but little altered; yet even that small grant of funds met with considerable opposition from certain members of the House of Representatives, who had unhesitatingly voted for the erection of a more sumptuous office building for themselves.

The United States Treasury has announced a surplus of some $300,000,000, and *included in this is $30,000,000 realized by the sale of War Department property,* and a further credit has

(*Continued on page 20*)

Type of quarters assigned to enlisted men, subject to fire hazard and uncomfortable in winter.

LEVACHA—
A Thief Hunt in Abyssinia

By PAVEL BOULIGIN

Illustrated by W. W. CLARKE

The 'levacha' suddenly made a gesture and all whispered, 'siet-leva-siet!'

THE sun had become unbearable. Its perpendicular arrows seemed to pierce through my very cork hat—result, a headache. Ordering Dessalin, the foreman of the government workmen on the plantation, to blow the trumpet for the rest, I quit work for my shady shanty. After washing and drinking the cold *tala* (barley beer), I sat waiting for luncheon, and read Molière. A few torn volumes of his works had come into my possession as an inheritance from Captain Trofinoff, a Cossack from the Don and one of my predecessors on the plantation who had been here ten years ago and who, according to rumor, was killed in the late World War. Mr. Michel, as Abyssinians call him, left to the population an exceptionally good opinion of himself, and to me a lot of books, for which I feel most grateful.

I had just read *The Invalid*. My thoughts had turned far away back to the dim parterre of the Art Theater. In my reverie I happened to catch the laughing faces of two of my natives, who forthwith ceased to laugh.

My servant Tasso, 'a-hemmed' at the door, and starting, I raised my head. Having already lived a year and a half in Abyssinia, I could never accustom myself to the noiseless appearances of those barefoot servants. Tasso, smiling, reported that one of the slaves, Gabri-Tadik, had been robbed of a *kouta* (tunic), a belt of cartridges and amulets. The slave had called the *levacha* and now they were about to give him the potion—and would I care to see it?

I got up quickly, caring indeed to see this strange performance of which I had heard much. Leaving my shanty, I found a crowd already gathered. Somewhat apart on some stones sat a boy of about fourteen years, cross-eyed and with convulsively twisted mouth. The mysterious intoxicating potion had already been administered.

I sat down on a chair brought by Tasso and began to watch. Tasso, fanning me from the flies (with the hair from a horse's tail fastened to a stick), sat stooped behind me, explaining his silliness by saying in whispers that we must not be standing, as the *levacha* would beat anyone found standing up. The word *levacha* comes from the word *leva*, which means thief. This is the name given to special boys of whom there are about 400 in Abyssinia. Not every boy can be a *levacha*, their ability being judged by special directors who at certain intervals go visiting the provinces in search of such boys to keep their number always intact, for as soon as a *levacha* grows up, he is no longer useful for the work. To put a *levacha* in working condition the director gives him a certain potion, after drinking which his eyes become crossed and his arms get limp. As soon as he finds the trail of a thief he tracks it up, following the thief's every movement, and catching him always.

The director stooped before the boy lying helplessly in the shade.

The crowd sat silently on the stones. The director made a sort of pass at the boy's head and the latter arose suddenly and began to walk about in the open space. Holding to the edge of his tunic, conductor also walked around beh him, quickly stooping in case *levacha* looked back. If the dire happened not to stoop, the *levc* would somehow hit him drowsily the head with his hand which looke if made of cotton.

AFTER two or three minutes of certain walking about, the *levacha* st up straight, paused a moment, started along the road with assura He had found the trail. All his mo ments became sure and exact, tho not in his natural gait. He sudde made a gesture and all whispe *'siet, leva—siet* (a woman, the thie a woman)!' The crowd followed *levacha* but I remained seated, as prestige of the *tellik choum* (the boss), and still more of the succes of Mr. Michel, did not permit me go to another village. Besides—it too hot! The *levacha* was not pleas to think about. There was someth lifeless in his walk, wooden, de strange as a mask personifying so one other than himself, uncan Suddenly the crowd surged back, with another boy at the head. T explained that they had been co pelled to give the potion to a rese *levacha*, because the thief had reac the river, washed himself and apparently now turned back. Wa *injira* (a thin pancake without butt and lemons baffle the *levacha*, knowing this, the clever *leva* washed.

The new *levacha* led the crowd the huts which were in the circuit my superintendence, and I could n follow. Dessalin, the village ch came asking me to order all inhabita of this village to stay in their hu Giving the order, I proceeded fart to see what more would happen, getting too close, 'tis true, as t *levacha* was more nervous than previous one and beat roundly director and those following. A walking around the (*Continued on page*

MR. FORD'S PAGE

OF THE DEARBORN INDEPENDENT

READING the signs of the times is a method of information open to everyone. It is first necessary, however, to know where these signs are to be found. Signs of the times are usually not so prominent as electric signs nor so persistent as advertisements. Oftener than not they are among the matters suppressed by agreement by the purveyors of publicity. The camera reports everything within its range, but this is not true of agencies which undertake to report the total field of life. For one thing, they do not see *through* things; for another, they arbitrarily pick and choose among those things which they see on the surface.

Even if it were true that the various reportorial agencies were earnestly trying to cover the field, the chances are that they would miss much through ignorance of the fact that signs of the times change their method of signifying themselves. This greatly puzzles and confuses people. In politics, the old-time torchlight procession and rousing enthusiasm are entirely lacking, which some interpret as a sign that popular interest in political matters is receding. They reach this conclusion by mistaking the signs for the thing itself, and by forgetting that the reality of politics may now be manifesting under other signs.

In religion, multitudes of good and honest folk are convinced that religion has become a secondary interest in the minds of the people because the old-time signs of religion are lacking. There is no more camp-meeting enthusiasm and the old-time methods by which men were led to signify an awakening of spiritual interest no longer produce results. Time was when men had to have a certain form of experience; if their experience took other than an orthodox form, then its validity was denied. The old-time signs have changed, and many people are led to conclude that the thing itself has departed. It is only another instance of our proneness to exalt the mold above the form, or the form above life itself. Life is a river which constantly changes its course, and the way of understanding is to follow the river, not the dried-up and deserted river beds.

Besides that, men reach the unity of thinking, which is one of the signs, in quieter ways than before. There was a time when men's thought could be prophesied from the methods that were used to mold it. That can no longer be done. After a success that was apparently unquestionable, the old methods of publicity have suddenly become empty of results. The type grows bigger, the ink redder, the shriek louder, the influence becomes less. An important and basically dominant part of the nation heads off in a direction opposite to that which the leaders point out. The blatant forces still lead in their own field and still monopolize the noise, but only the foolish mistake the noisy spaces for the important ones. Public conviction is in these days marching without banners or bands.

So that it is one of the first directions to the seeker, that the real signs of the times are mostly marked by silence. By the time they emerge into actuality, they are no longer signs, they are then the times themselves.

This, of course, means a closer reading of matters than appears in print. Signs of the times are definite previous intimations of what is to be, but the printed line is a report of what has been. Foresight is not a magic gift which some have and some have not, it is sight fixed upon the things which exist in tendency and embryo. Coming events cast their shadows before, says the old adage, but the shadows are beneath the surface, where the coming events are. Life is little on the surface. What we see today is the product of distant yesterdays; yet hidden in today is the root of distant tomorrows; it is the man who knows the coming tomorrows who really sees most of life.

Furthermore, this direction, when followed, demands a different attitude of mind than most of us usually carry. We are trying to make up our mental world out of daily reports of superficial things and in doing this we are creating a most flimsy scene. We are thereby making our minds mere highways over which the impression of others may pass, or conduits through which they may pass their material. To read the signs of the times one must do a kind of original work—read what few are reading, reach conclusions without coaching, deal with fundamental values which lie beneath and behind all other values. One leads away for himself, instead of following others. One becomes aware of principles instead of frittered accidents. And all this means, of course, that one has deeper foundations on which to rest in changes that sorely upset unanchored and uninstructed minds. The signs of the times demand our learning a new language, different from the daily jargon; it installs one in a new science. This, however, is somewhat preliminary and preparatory treatment; it is a matter worth looking at again.

TWO essentials of wisdom are knowledge of fundamentals and awareness of development. So far as man is concerned or any possible human experience, certain things are fixed or rooted. But out of the roots comes growth. To know what is growing and in which direction it is growing, comprises the highest prudential wisdom; it is ability to read the signs of the times. Not of the times that are, but those to be. People who only try to understand the immediate times are somewhat behind the times; those who know them at all began to understand them before they were. Signs of the times, then, are signs of the times to come. The signs of the times that now are, were given long ago.

Farm 'Relief'

CONGRESS passed so-called farm relief legislation by the enactment of the McNary-Haugen Bill. The politicians have thus fulfilled their pledge to their farmer constituency. They can now lift up their hands and say, 'We did our best.' Not the farmer's welfare but the farmer's vote has been their guiding star.

The point was raised that it is special-privileged legislation and on this ground it was once defeated. But those who have been loudest in opposition have been most active in support of a measure of much greater special-privilege, namely, the McFadden Branch Banking Bill. If legislation of the most highly special-privileged and monopolistic character can be enacted in behalf of one business group, how can the beneficiaries of such Congressional favors consistently oppose special-privilege for the farmer?

The farmers' measure, should it become law, will at best be of doubtful benefit and fall far short of accomplishing most that was claimed for it. The passage of the McFadden Bill has created a condition far more dangerous to the farmer than he can hope to avoid through any manner of relief legislation.

The one bill implies that bank dividends are something sacred—bank prosperity must be guaranteed; but if the farmer fails in prosperity or dividends it is the result of his own cussedness or ignorance and he deserves no special consideration; he must be granted no favors to offset those erected against him.

The politicians have fulfilled their promises and are now fortified for another campaign. The McNary-Haugen Bill should have been defeated because it is economically wrong, but so also should have been the other bill.

Too Late

THE proposal to create a new party out of the dry elements of the Republican and Democratic parties comes too late. The only possible objective that such a party could have has already been attained. It would be like creating a new anti-slavery party. In American history two reforms marched down the years side by side—Anti-Slavery and Anti-Liquor. The wise ones thought that Anti-Liquor would be the first to give battle and win. But events turned out otherwise; Anti-Slavery was first called to the field. A party was formed that embodied that principle, and upon that party devolved the responsibility of elections, war and reconstruction. The issue, being settled, lives no longer.

Fifty years later, the liquor question came prominently into national politics, this time without a specific political party being formed to carry it before the nation. A hundred years of education in temperance principles had prepared all parties in Congress and in the states to deal with the matter. By a larger proportion of states than ever adopted any other Constitutional Amendment, the anti-liquor amendment was suggested.

Now, if it is a case of someone trying to evade the law which abolished slavery, a case of someone trying to introduce human beings clandestinely into bondage again, the course of action is clear.

And if it is a case of someone trying to evade the law which abolished liquor, a case of someone trying to introduce the prohibited traffic clandestinely, again the course of action is clear.

The question is not one for 'wets' or 'drys'—it has passed out of their hands.

The question is for the Government.

The Government heads up in the President.

Bankers in the Saddle!

THE McFadden Branch Banking Bill has passed and though at this writing it has not been signed, no one doubts that it will be. What does this Bill mean? It means, first, that the Federal Reserve System was failing through the withdrawal of member banks, and it was necessary to offer new inducements to retain such members as remained, as well as legislate new compulsions upon the bankers who prefer American to European modes of banking. It does this by giving the twelve regional Reserve banks *perpetual charters* in order to remove the danger of their being revoked when the American people discovered exactly what Corporation Banking was doing to them. It is yet seven years before the original charters expire, in 1934. Seven years in which the American people could have discussed and learned to understand the banking system that has been set up; yet with no public discussion of the matter, and practically no Senate discussion, the Bill passes. Its proponents frankly feared what an awakening public interest would do in the next seven years. So, seven years before a renewal of the twenty-year charter, a *perpetual charter* is put through. Besides this, the Bill also permits member banks to deal in speculative investment securities which was condemned even in the days of Senator Nelson W. Aldrich. In brief, no one but the instigators of it realizes how many privileges are concealed in this Bill.

On this most important measure the Senate voted cloture. That means a muzzled Senate. It means silenced opposition. It means, in this instance, that the money power had given its order, and has been obeyed.

Most bankers who supported the Bill do not understand its far-reaching effects. The centralizing features of the Bill will eventually draw banks

under control of the regional bank. Instead of the member banks owning the regional bank, as now theoretically they do, the regional bank will own the member banks. The enlarged powers granted the regional bank practically obliterate local interests in banking, give absolute control of all business to private banking concerns by giving them absolute control of money and credit, and represent the most advance move possible to be made for the complete subjugation of industry to finance—a crusade which is destined to failure. Moreover, the new Bill, now passed, proves the Federal Reserve System to be brokerage medium and stabilizer for foreign securities which the people will purchase on the assumption that the United States Government guarantees them, while as a matter of fact these securities can be dealt with precisely as the Liberty bonds were, that is, hammered down below par in the markets, and declared 'frozen assets' for the benefit of speculators who now own our Liberty bonds.

The astonishing facts remain that seven years before a charter expired, it was renewed *for ever and ever;* that few Senators or Congressmen ever read it, that fewer still even partially understood it, and that discussion of it was suppressed and the public strictly excluded from any interest in it.

New Test This Time

PRESIDENT COOLIDGE has asked the nations that joined in the Washington Conference to join and hold another at Geneva for the purpose of further reducing armaments. This announcement was followed in several days by an unofficial suggestion that a refusal from Italy and France need make no difference, since the United States, Great Britain and Japan could handle the matter.

The message in which the President apprised Congress of his act contained two points of rather unusual interest: first the statement that if we had completed our naval program of 1921 it 'would have given us first place on the sea'; second, the statement that 'the signatories of the Washington treaty have fulfilled their obligations faithfully.' The first will be welcomed by many, for it clears up a point of controversy. All that remains to be decided now is whether other nations, seeing that we were about to become first on the sea, prompted the suggestion of a Washington Conference for the purpose of preventing that supremacy. There are responsible persons who assert that this is the true explanation of the origin of that conference. As to the second statement, many responsible persons still assert that while the United States sank more than $300,000,000 worth of new ships, other nations merely sank blue prints. One very distinguished attendant at the conference recently said that the British representatives could hardly believe their ears, when the Americans instantly assented to seemingly impossible proposals which were intended merely to begin a bargaining discussion. It either establishes our sincerity or impugns our wisdom. Certain it is, the Washington Conference *cost* America much, while it *saved* Europe much. But if it really served the cause of peace, the cost was not too great.

The suggested conference, when it is held, will present a different set of conditions. The United States no longer threatens as the leading naval power. The test next time will not involve our sincerity so much as that of the other conferring nations. It is essential that we know just how real that is. President Coolidge's proposal is an excellent method for finding it out. It will show us where we stand with the nations, and if all is well on that score it will open up a way for more practical action among the nations who can do most to balance the world's action in time of stress. The businesslike method of President Coolidge's action, and its entire freedom from extravagant or indeed any other kind of prediction, will generally commend it.

Spring!

DRIVEN by the strong south wind fleecy clouds skim over the fields. There is a sound and a swaying in the treetops by the river. The breeze grows warm with a clearly felt promise of life. Down wooded hillsides leap the cold streams that draw off the last lingering snows of winter. The woods awaken. A restless spirit is manifest in the animals of the open. Red squirrels scamper in the high tree branches and birds flutter in the hedge openings with many twitterings. Even the insects know it is springtime and emerge to seek the broken limbs of maple trees dripping with sweet, sticky sap. The caw of the crow gains an exultant note. High in the top of a hemlock an owl has her nest; the young are ready to take wing, they were born in February. Then with burgeoning green buds bursting into leaves and the arrival of the southern birds—Spring will be here.

New York's Stage Reform

THE reform of the stage in New York City assumes that there is a 'stage' to be reformed, when there are mostly 'shows.' New York has the kind of 'shows' which flourish in the countries from which most of New York's population comes. The mischief arises from these 'shows' being regarded as American. A further mischief arises from the fact that play production centers in New York, just as Tin Pan Alley jazz popular-song production does. Long before the decent American element in New York was aroused to its present revolt, the legitimate American drama had shaken the dust of the city off its skirts and hastened to the clean Little Theaters which have now sprung up over the land. The present 'reform' is important mostly as indicating that American-mindedness has not been entirely destroyed by the alien-mindedness which prevails there. As this alien-mindedness pervades everything else, from literature to finance, there is room for further clean-ups. The invisible sign over New York is *ICHABOD*—it has forfeited its glory.

American trainers now study the individual athlete, and prescribe particular foods for his menu.

Courage and Endurance—Matters of Stomach Not of Heart

By H. G. SALSINGER

Drawings by W. O. FITZGERALD

WHEN Paavo Nurmi astonished the world with his remarkable long-distance running performances at the Olympic Games in Paris in 1924 and continued smashing records on the indoor tracks of the United States during a visit to America in the spring of 1925, our athletic experts and trainers began 'taking him apart.' They wanted to find out just why this phenomenal Finn was the best runner of all time over distances from a mile up. Among the various discoveries made, or reported made, was that of a physician who examined Nurmi and reported that he possessed a freakish heart. The Nurmi heart, so the newspapers reported, worked with less beats to the minute than that of any other runner and therefore Nurmi was able to run at greater speed over long distances. The freakish heart gave him super-endurance.

Joie Ray, who was the champion mile runner before Nurmi arrived, was asked about the physician's statement regarding Nurmi's heart and Ray replied:

'His heart can't be any better than perfect, can it? Mine is perfect and just as good as Nurmi's. I have had several famous heart specialists give me thorough examinations and all of them say my heart is absolutely 100 per cent.'

In years gone by trainers of athletes have laid most emphasis on the heart and the public has judged an athlete's heart by his performances. Let a man win in close competition and there is a certainty that reference will be made to his heart. Winning athletes are frequently described as men 'with the hearts of lions.' The expressions 'stout-hearted,' 'lion-hearted,' 'great-hearted,' 'steel-hearted' and others are familiar to all readers of reports on sport events. Men win because they have heart, or lose because they lack heart.

To say that a man has heart means that he has courage. Heart is another word for gameness. It has been used as a synonym ever since we can remember.

One day I talked to a former Yale football player. He was a famous linesman in his day and I remembered him as having often been described as a man of lion heart. He was also a fine amateur boxer, wrestler and oarsman. In all the sports in which he engaged heart is the most essential asset, according to the general conception of sports.

On the occasion of this conversation he was telling me that of late he was feeling better, but that he had been having a hard time of it. Suddenly he launched into the subject of courage.

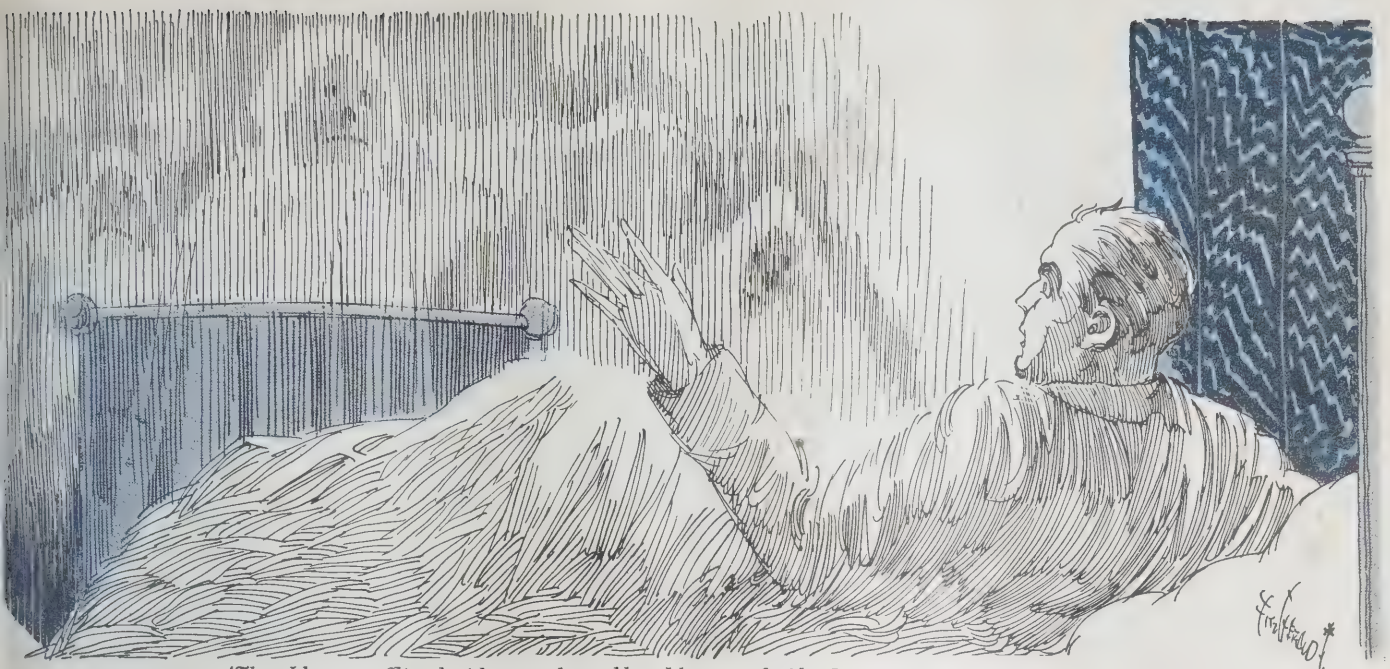
'I had never been sick in my life. Before this stomach trouble took me I was the healthiest man in America, at least as healthy as any. I was strong as a bull. I could lick any man in th world; at least I thought I could I was afraid of nothing that walked o breathed. I used to wonder what fea was and how anyone could be afrai of anything. I was like old Bo Fitzsimmons, who one day asked hi trainer, "Say, Dan, tell me an' what it like, this here thing they call fear? I had never known fear.

'Then I became afflicted wit stomach trouble. I became afraid From a man that had never known fea I developed into one that never knew anything else. I don't believe there wa a bigger coward in the United State I imagined things. I couldn't slee and I would tremble in bed, thinking heard strange noises or imagining a kinds of things that could or woul happen to me. It was a terrible thing

'I sought out specialists and sub mitted to examinations. Each one would ask about my heart and each o them told me that my heart was perfect It was my stomach that had gon wrong, not my heart. But there wa the fear. In college I had been single out as a man with the heart of a lion a man of better heart than his contem poraries in sport. I was unafraid be cause of this marvelous heart. Her was my heart as good as ever but was the rankest of cowards.

'In time I was cured of my stomach ailments. As I began recovering I als began losing fear. And when I becam cured I had regained the old courage

The menu of an English athlete would throw an American trainer into a state of speechless bewilderment



'Then I became afflicted with stomach trouble. I became afraid. I imagined things, I couldn't sleep.'

am again no longer afraid of anything. have the same courage that I had in y youth.

'I concluded that courage was not matter of heart but of stomach. he more I thought about it, the more nvinced I became. I talked the atter over with a number of specialists id they agreed ith me that the eart had noth- g to do with ourage. The omach had erything to do ith it.'

Some time ter I met Cap- in John J. Mc- wan, soldier id coach of the nited States ilitary Acad- my football am. Captain cEwan was one the best cen- rs football has own, a man of re aggressive- ss and courage, player often described as lion-arted. When he graduated from the ademy he began a military career. e has seen active service and come in ntact with thousands of men whose usiness requires courage above all her virtues. If any man should know mething about courage, then Captain cEwan seemed to be the man. I ld him of the former Yale football ayer and of his experience. I asked aptain McEwan what he thought out the relation of heart to courage id the relation of stomach to courage. is answer was:

'Heart has little, if anything, to do ith courage, stomach practically everything to do with it.

'All men have courage in some degree. Some men have more of it than others. In some it is better developed.

'In sports we have paid so much attention to heart and lungs that we have slighted the stomach. That is true, at least, of the past.

'Heart has little, if anything, to do with courage.'

'Some years ago we had a remarkable football player at West Point. He was one of the best I have ever seen. He had wonderful stamina and endurance. There was never a more courageous man. When he graduated he was refused a commission. The medical examination, which is given to all graduates before they are commissioned, revealed that this man had a bad heart. While his heart was so bad that he had to go into private life, he remains one of the most courageous men I know.

'The lungs are misunderstood just as the heart is. We see an athlete who has good wind, or endurance. We immediately decide that he has wonderful lungs. But the lungs do not create endurance any more than the heart creates courage. Endurance and courage are both founded on the stomach.

'We decided several years ago to give most of our attention to the stomachs of the athletes. We use every means to keep the stomach in good condition, for when the stomach is right the player is also.'

I asked a number of trainers about the matter and all agreed, at least in part. One of them pointed out to me that he had never known a man of bad stomach to be a man of supreme courage, while he had known quite a number of men with weak hearts but unsurpassed courage.

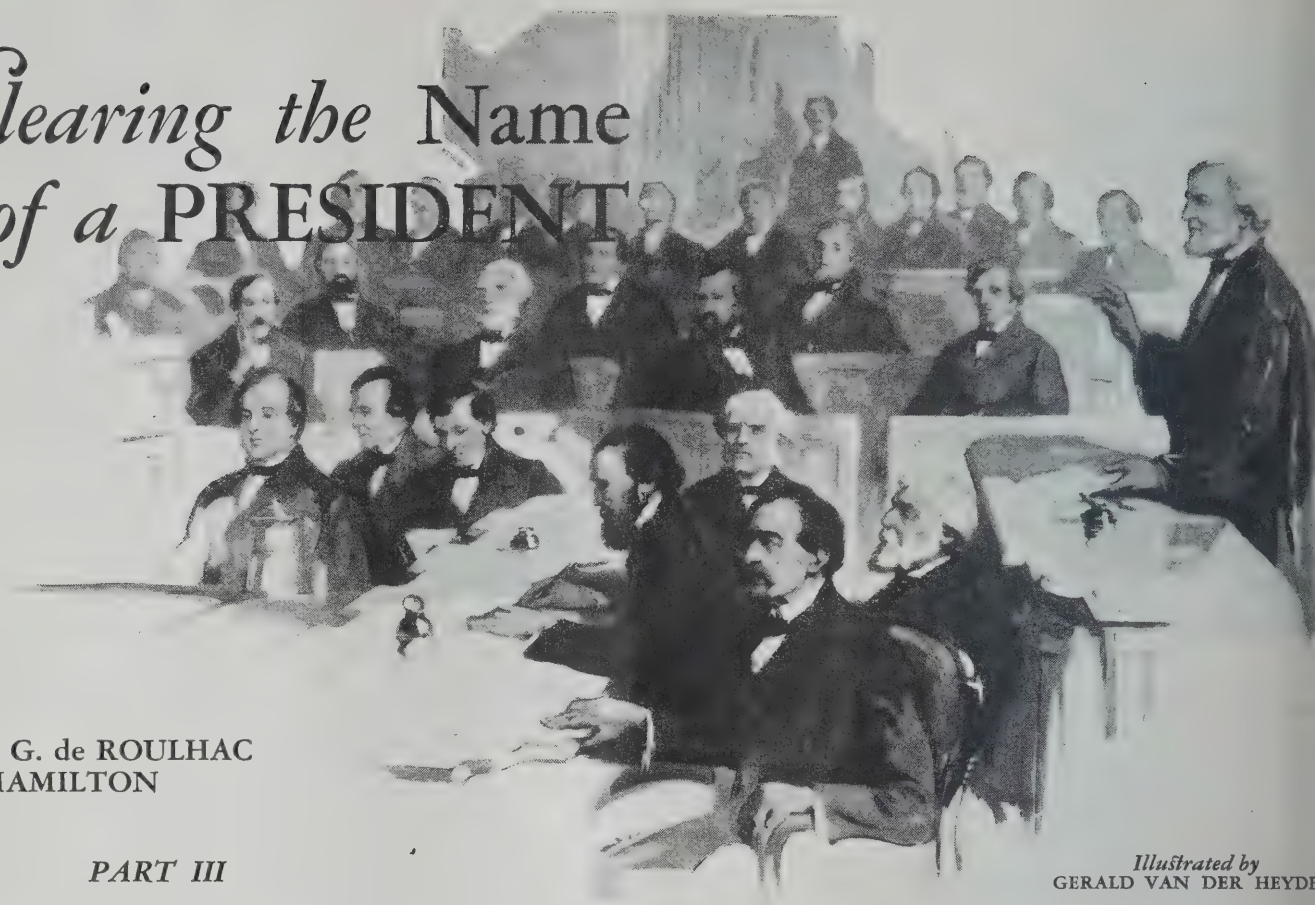
The most important race that Nurmi was scheduled to run during his American tour was against his fellow countryman and greatest rival, Willie Ritola. The race started and Ritola soon went into the lead. He maintained his advantage and when he seemed absolutely certain of victory, Nurmi left the track. His action caused many cynical remarks regarding the courage of Nurmi. They said he lacked heart and that it required a stout-hearted opponent like Ritola to bring out the fact. But what caused Nurmi to leave the track was not his lack of courage but a stomach ache. Nurmi had eaten a veal steak before the race and the veal steak did not agree with him. He could not go on.

Napoleon Bonaparte, years ago, discovered the basis of courage. Bonaparte paid particular attention to the commissary departments. He was the author of the now famous line:

'Armies fight on their stomachs.'

If you want to know the secret of the Finnish success at the last Olympic Games it will not be necessary for you to make intricate physical examinations and discover the secrets of their hearts and lungs. You can get the exact cause by studying their diet and mode of living. It is this same diet and mode of living that will make Finland the most dangerous opponent the United States has found in world athletic competition at (*Continued on page 25*)

Clearing the Name *of a* PRESIDENT



By J. G. de ROULHAC HAMILTON

Illustrated by GERALD VAN DER HEYDE

PART III

ON FRIDAY, March 13, 1868, the Senate met as a Court of Impeachment with the imposing, robed figure of the Chief Justice of the United States in the chair. The House managers entered and the sergeant at arms three times loudly summoned Andrew Johnson who did not appear. Instead there entered his counsel, Henry M. Stanbery, who resigned as Attorney-General in order to defend him; Benjamin R. Curtis, of Massachusetts, formerly an Associate Justice of the Supreme Court of the United States, who had won fame by his dissenting opinion in the Dred Scott Case; and Thomas A. R. Nelson, of Tennessee, an able and eloquent lawyer and the close personal friend of the President. In addition to these, Jeremiah S. Black, of Pennsylvania, formerly Attorney-General and Secretary of State of the United States, and William M. Evarts, of New York, possibly at this time the leading lawyer in the country, were announced as counsel. Black withdrew later for reasons not connected with the trial, and was succeeded by William S. Groesbeck, of Ohio, who made a national reputation by his part in the defense.

The President requested forty days to file an answer. The managers objected, Benjamin F. Butler hotly exclaiming, 'Forty days! As long as it took God to destroy the world by a flood!' The Senate granted ten days and adjourned. On March 23, the President's reply was filed and his counsel asked for thirty days to prepare for trial and were granted six, the trial beginning on March 30.

As organized the Court consisted of fifty-four Senators, no southern state but Tennessee being represented. Twelve of these were Democrats, all of whom were known to favor acquittal. Of the forty-two Republicans, twenty-eight had already substantially recorded their vote of guilty, and of the opinions of a number of others there was never an instant's doubt. The trial, therefore, was to convince a small group of hesitant Republicans, to furnish justification to the country and the world, and to comply with the requirements of law. In the accepted sense of the term it was not a trial at all.

Butler opened for the managers with a skilful lawyer's plea in which he argued that the proceeding was essentially political rather than judicial, that an indictable offense was not necessary to conviction, and that the Senate was bound by none of the rules of law, precedent, nor evidence ordinarily observed by courts of justice. He argued further that Stanton came clearly under the Tenure of Office Act since Johnson had no term of his own, but was merely filling out Lincoln's. Further, he held that the President had no right to regard a statute as unconstitutional or take any steps to bring it before the courts for interpretation.

The first week was consumed with the hearing of evidence for the prosecution. To the surprise of many of th audience—both in and out of th Senate chamber—no allusion was mad to the President's loudly proclaime habitual drunkenness. This omissio was based on sound reason; a clos investigation had resulted only i clear proof that Johnson was uni formly temperate and sober.

IN ITS rulings, excluding muc evidence favorable to the Presiden that would have been admitted in an court of law, and admitting muc hostile to him that no reputable judg would have even considered, the Senat showed clearly its bias and stampe the whole proceeding in the beginnin with a character which it never los This, combined with the weakness o the testimony, made the President chances of acquittal look much brighte

Judge Curtis opened the case fo the defense on April 9, in a super argument which utterly demolishe Butler's main contentions as well a the articles. Evidence for the defens followed, occupying, exclusive of inter missions, about four days. Much of th testimony most vital to the defens notably that of Secretary Welles an other members of the Cabinet, designe to show the belief of the President tha the law was unconstitutional and h efforts to secure judicial interpretatio of it, was excluded by the Senate.

Thirteen days followed, occupied b the argument of counsel, the manager consuming six and the defense seve

While some of the speeches are notable, hey do not rank among forensic lassics. As a matter of fact, the case ffered no opportunity for this. It was oo inadequate. The chief concern of he managers was to find some justifica- ion for the indictment of the President nd they could not find it. They were eeking an excuse for a partisan con- iction already anticipated, which bore o relation to the evidence. The ounsel for the President had perforce o follow them into the region of vague, ndefinite and intangible charges not ontained in the formal indictment.

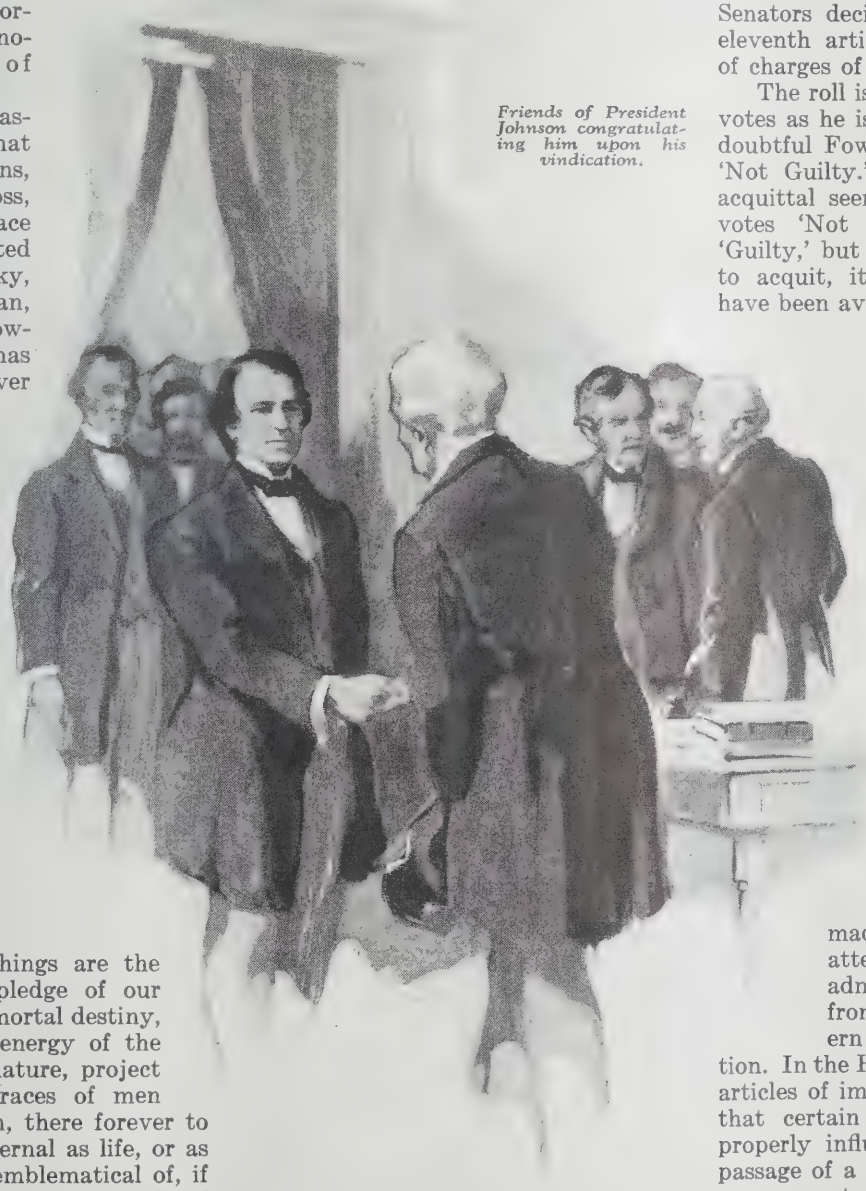
THE managers were not sparing of buse of Johnson, Williams going so ar as to cast doubt on the purity of his atriotism during the war. Boutwell nade the most remark- ble contribution to the rial when, after com- aring Johnson unfavor- bly with the most no- able criminals of istory, he said:

'Travelers and as- ronomers inform us that n the southern heavens, ear the Southern Cross, here is a vast space vhich the uneducated all the hole in the sky, vhere the eye of man, vith the aid of the pow- rs of the telescope, has een unable to discover ebula, or aster- id, or comet, or lanet, or star, or un. In that reary, cold, dark egion of space, vhich is only nown to be less han infinite by he evidences of reation elsewhere, he Great Author f celestial mech- nism has left the haos which was in he beginning. If his earth were apable of the entiments and motions of justice nd virtue, which human, mortal things are the vidences and the pledge of our ivine origin and immortal destiny, would, with the energy of the emental forces of nature, project is enemy of two races of men to that vast region, there forever to ist in a solitude eternal as life, or as e absence of life, emblematical of, if ot really, that "outer darkness" of hich the Saviour of men spoke in arning to those who are the enemies themselves, of their race, and of eir God.'

Nelson, after listening to the foul abuse of the President, burst out in his speech:

'Who is Andrew Johnson? When treason was rife in this capitol . . . where was Andrew Johnson then? Standing here, almost within ten feet of the place on which I stand now, solitary and alone, in this magnificent chamber, when "bloody treason flourished over us," his voice was heard arousing the nation. Some of you heard it. I only heard its echoes as it rolled along from one end of the land to the other . . . He who has periled his life in a thousand forms to put down treason—he now is stigmatized as a traitor himself . . . '

By the conclusion of the trial it was clearly understood that of the Republican Senators, Henderson, Sherman, Howe, Willey, Van Winkle, Fessenden, Grimes, Trumbull, Fowler, Sprague, Ross and Anthony were doubtful. In a short time several dropped out of the doubtful class. Howe, Sherman, Sprague, and probably Anthony, were soon seen to be entirely safe for the radicals; Trumbull, Fessenden, and Grimes were just as clearly certain to vote for acquittal. Henderson almost certainly belonged to the latter group. Fowler would not discuss the question. No man could prophesy how Willey and Van Winkle would finally vote, and so after a vain attempt to bring some influence to bear on Henderson, the radicals directed their chief attention to Ross of Kansas who was bombarded with letters from home, telegrams, resolutions, and threats, in the hope of winning his consent by intimidation, a procedure which only served to stiffen his resolution to be a judge in fact as well as in name.



Friends of President Johnson congratulating him upon his vindication.

THE voting was set for May 16, and because it was clear that the first article was certain of defeat, the radical Senators decided to vote first on the eleventh article, which was a farrago of charges of unindictable acts.

The roll is called and every Senator votes as he is expected to do until the doubtful Fowler is reached. He votes 'Not Guilty.' Ross follows suit and acquittal seems certain. Van Winkle votes 'Not Guilty.' Willey votes 'Guilty,' but had his vote been needed to acquit, it almost certainly would have been available, with possibly that of another. The final vote is: Guilty 35; Not Guilty 19, and the President is acquitted by one vote. After a futile attempt on the part of the Senators favoring acquittal to secure a final adjournment, the Senate adjourns to May 26.

The friends of the President and Johnson himself were joyful over the result, but it was too soon to be over-confident. The radicals were full of disappointment, anger and chagrin, but they had not given up hope. First they made a shamelessly immoral attempt, which failed, to admit enough radical Senators from the reconstructed Southern States to secure conviction. In the House they threatened new articles of impeachment, and, claiming that certain Senators had been improperly influenced, they secured the passage of a resolution authorizing the managers to investigate the matter. The latter began to take evidence, seizing the files of the telegraph offices and scrutinizing the bank accounts of suspected Senators.

They summoned (*Continued on page 22*)

This Country *Needs More* Able-Bodied LOAFERS *of a* Certain Sort

By ARTHUR HUGHES

Illustrated by W. W. CLARKE

The music and the gayety of others seemed to flood him with recollections.

PROFESSOR IRVING FISHER of Yale is willing to wager ten dollars against one dollar that, by the end of this century, we shall have become a nation of octogenarians. Some day Yale may have a professor who will be willing to wager a small amount, payable, in the event of loss, years after his death, that by a certain time we shall have learned how to live seventy or eighty years without becoming tired of life. Merely because we cannot get together and talk it over, we shall probably never know how great a percentage of those persons who are more than fifty years old are rather sick of it all.

They are looking at the world through the little end of the telescope and it seems small and far away. Not many would care to live their lives over again. They are considerably bored, most of the time. H. G. Wells, in his latest book, *The World of William Clissold*, leads us to infer that even he is beginning to find life more and more uninteresting. Here and there are exceptions, but for the most part the rule seems to hold good—that after fifty boredom begins to set in, harder and harder, each year.

From ten o'clock in the morning until as late at night one may see groups at these sidewalk places.

Here is something with which we should concern ourselves because, unlike the weather, we can do something about it. We shall derive no advantage from becoming octogenarians if we but add to the number of wearisome years. So long as a person is in good health he should never become tired of life, nor should life ever become dull. When the healthy become bored it is but proof that they are playing the game of life in the wrong way. It may or may not be their fault. They may be victims of circumstances, prisoners of environment. But whatever the reason it can be removed. The time will come when side by side the Fisher group of long livers will be another group—a group of philosophers and teachers—who will be working just as energetically to teach their fellow men how to make life enjoyable to the last.

May I try to be a teacher? I am more than fifty. My life has been so different from that of the average human being that my deductions from it may not have much practical value. Yet it seems to me that our first great blunder is in exalting youth and belittling age. Nobody enjoys youth so much when he is young, but for some inexplainable reason everybody looks back to it with longing, and the further he becomes removed from it the greater is his longing to get back to it. And, of course, it is a longing that can never be gratified. That is what makes it so hard. Almost everything in life that is worth while seems to have been lost.

I saw a man the other evening who must have felt that way. He was about sixty. He was having dinner with a woman about twenty who was obviously his daughter. The room in which we were dining happened to be a room where usually only men go. He had apparently come back to it, as I had, through force of long habit, even though his daughter accompanied him. While waiting for his dinner he sat with a far-away look and listened to the music that came drifting in from a larger room where there was dancing.

He didn't speak; he just listened—and thought. But the look that came from his eyes showed that his thoughts were somber. The music and the gayety of others seemed to flood him with recollections. There he was in just such a place as he had been a thousand times when he was young. Everything was the same, the music, the life—everything. The world of his cherished youth was right at his finger tips yet he could not touch it. What torture when he so wanted to touch it! Yet if he had touched it, it would have been as cold as a dead fish. He really did not want to touch it. He was tortured only by the thought that he did.

Robert Louis Stevenson, in his essay on *Crabbed Youth and Age*, put his finger on the sore spot that hurt that man. He said such persons were not good artists in life, meaning that they did not live their lives as lives logically should be lived. To be an artist in living, said Stevenson, 'is to be always seasonable, and to change with a good grace in changing circumstances. To love playthings well as a child, to lead an adventurous and honorable youth, and to settle, when the time arrives, into a green and smiling age, is to be a good artist in life and deserve well of yourself and your neighbor.'

This is exactly what those who become bored and tired of life do not or cannot do. They are not seasonable. They do not change with their age.

Instead of seeking happiness in a manner suitable to their time of life, they seek it in a manner that was once suitable but is so no longer. The opportunities at hand are sacrificed for the opportunities that no longer exist. The field at their feet is neglected for the mirage on the horizon. There is no nourishment in a mirage. Anything that is real, substantial and under one's feet is a better place to seek happiness than a vision that dances on the rim of the world. Everybody knows this but everybody does not practise it. Those who do not practise it become tired and bored.

Americans are too busy to live—at least we think we are. It is partly a delusion and partly a bad habit.

I do not believe anybody ever had a better youth than I had or that anybody has had a more enjoyable life than I have had. I began to be interested in life the moment I realized that I was alive. As a boy I had nothing in particular to be happy about except the place in the country where I lived, but the days were never long enough to enable me to do all that I wanted to do. From twenty to thirty were years of high adventure—working, learning, traveling, crossing the United States for the first time (and I never can forget that crossing; Columbus got no more thrill from discovering America than I did), meeting people from all over and generally becoming acquainted with the planet upon which I lived.

From thirty to forty were blazing, terrific years. I enjoyed them much more than I did the preceding ten, but nevertheless I look back to them as one looks through a peephole into a furnace. I worked very intensely and I had the even greater task of learning how to live with children. 'The practice of letters,' to quote Stevenson again, 'is miserably harassing to the mind, and after an hour or two's work, all the more human portion of the author is extinct.' No matter how nice children are—and I like all children—they do not make writing any easier.

FROM forty to fifty I began to get hold of myself. Life was no longer a fiery furnace. I did more work but I did it easier. Almost unnoticed, my whole method of living changed. I spent less and less time in New York and more time at home. New York is still sprinkled with old friends of mine, but I never see them. I have committed the great error against which Emerson warned of permitting my friendships to suffer from lack of repair.

If I live much longer I suppose I shall have no friends at all—I who care more for friends than for anything else. I do not know why it has happened. I suppose I care too much for reading. I get more happiness from reading than from anything else, and the older I grow the more I like to read. Yet I am a million miles from being happy and oftentimes think I am one of the most miserable men in the world.

The trouble with me is that I am not permitted to run a freight train. I was waiting for a train the other day and a freight train came along. I think it was the longest train I ever saw. It stretched along the bank of the Hudson for more than a mile. It was so heavy that the big locomotive could hardly do twenty miles an hour with it. As the locomotive went by I noticed the engineer calmly smoking a pipe and looking out on a perfect day. Since I was a small boy I have always wanted to run a locomotive, freight trains preferred. High-speed trains never appealed to me; nor running a train at night when one cannot see well. If I were running a freight I should want to leave the train at night wherever it happened to be at sundown and pick it up the next morning.

The point is that I am tired of doing one thing so long, and the thing I would like to do would be of no service to anybody, which is sufficient reason why I should not be permitted to do it. I take it that this is what is the matter with most other persons more than fifty years old who find the road getting dusty. They have done one thing too long. They should occasionally have a rest by doing something else for a while. But this is more easily said than done. Swapping horses in the middle of a stream is dangerous.

We should be a happier people if we had paid more attention to the development of the gentle art of loafing. Loafing does not mean sitting around doing nothing. It means sitting around talking. The French are experts at it. We think it is a crime. We are told that it is disgraceful. Our idea is that we should be busy all the time, tirelessly adding figures to the long row that, at the end of the year, stands for the national production of commodities. Of course commodities are necessary, but whoever gets out of life nothing but commodities does not get much. Commodities are not good for anything, anyway, except as a means to an end. It is what we do after we get the commodities that counts. We sleep to get strength with which to produce more commodities.
